W70-07649 -- W70-08148

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 19
OCTOBER 1, 1970

W70-07649 -- W70-08148

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

Doc.
I 1.94/2:
3/10-12

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1B. Aqueous Solutions and Suspensions

A STUDY OF A SPECIFIC INFLUENCE OF DISSOLVED IONS ON THE STRUCTURE OF WATER,
Rocketdyne, Canoga Park, Calif.
J. Greyson, and H. Snell.
For sale by Superintendent of Documents, US Government Printing Office, Wash, DC 20402 - Price $0.45. Office of Saline Water Research and Development Progress Report No 523, Jan 1970. 32 p, 7 fig, 4 tab, 33 ref. OSW Contract No 14-01-0001-1701.

Descriptors: *Water structure, *Ions, *Solutes, *Thermodynamic behavior, *Desalination processes, Thermodynamics, Water properties, Aqueous solutions, Water chemistry, Heavy water, Membrane processes.
Identifiers: Transfer properties, Transfer free energy.

Entropies of transfer between heavy and normal water for several multivalent cations and several polyatomic anions were determined from combination of heats of transfer obtained from calorimetric measurements with free energies of transfer obtained from cell measurements. The ions investigated included the alkaline earth cations, the group of aliphatic acid anions from the formate through the caproate, and the inorganic anions carbonate, nitrate, sulfate, and sulfite. The standard heat of transfer values for the alkaline earth chlorides and the sodium salts of the inorganic anions indicated an exothermic transfer for the process salt in heavy water to normal water. For the sodium salts of the aliphatic acid anions, the heat of transfer was negative for sodium formate, near zero for sodium propionate and butyrate, and positive for sodium caproate. Calculated entropy values followed the same pattern as the heats. The alkaline earth chlorides (with the exception of magnesium chloride) behave as structure-breaking salts. The structure influence and the concentration dependence of the entropies of transfer of the salts are explained in terms of the Gurney cosphere model. (Knapp-USGS)

STUDIES ON THE DECOMPOSITION OF ORGANIC DETRITUS DERIVED FROM THE TURTLE GRASS THALASSIA TESTUDINUM,
Miami Univ., Fla. Inst. of Marine Science.
Tom Fenchel.
Limnology and Oceanography, Vol 15, No 1, p 14-20, 1970. 5 fig, 16 ref.

Descriptors: *Decomposing organic matter, *Detritus, Biological communities, Oxygen, Bacteria, Diatoms, Amphipoda, Metabolism, Respiration, Ecosystems, Animals, Florida, Sampling, Algae, Nematodes, Fungi, Actinomycetes, Cyanophyta, Rotifers, Food chains, Sea water.
Identifiers: *Turtle grass, Thalassia testidinum, Ciliates, Parhyalella whelpleyi, Flagellates, Fecal pellets, Key Biscayne (Fla), Monas, Oikomonas, Tropidoscyphus, Entosiphon, Bodo, Rhynchomonas, Euplotes, Aspidisca, Uronema marina, Cyclidium, Diophrys, Hydrobia, Littonotus duplostriatus.

Measurements of metabolic rates do not always wholly depict a specific component's role. The quantitative composition of microbial communities living on detrital particles derived from turtle grass Thalassia testudinum was studied. Organism numbers on and rate of oxygen consumption of detritus are approximately proportional to total surface area. Field samples of detritus harbored about 3 billion bacteria, 50 million flagellates, 50,000 ciliates, and 20 million diatoms and consumed from 0.7 to 1.4 milligrams oxygen/hour per gram dry weight. The detritus-consuming amphipod Parhyalella whelpleyi feeds on detrital particles and on its own fecal pellets but only uses the microorganisms; dead plant residue passes undigested through the intestine. After a few days microbial communities living on fecal pellets are qualitatively and quantitatively comparable to those living on other detrital particles. The amphipods decrease detritus particle size thereby increasing its total surface and thus the microbial activity. In less than four days, mechanical activity of amphipods may increase the detrital oxygen uptake by 110% of their own metabolic rate. Measurements of respiratory rates of the amphipods will therefore give a depressed estimate of their total role in the ecosystem. (Jones-Wisconsin)

THE ESTIMATION OF RUNOFF FROM RAINFALL FOR NEW BRUNSWICK WATERSHEDS,
Nelson Basin Board, Regina (Saskatchewan); and New Brunswick Univ., Fredericton. Dept. of Civil Engineering.
J. Lee, and D. I. Bray.
Journal of Hydrology, Vol 9, No 4, p 427-437, December 1969. 11 p, 1 fig, 3 tab, 11 ref.

Descriptors: *Rainfall-runoff relationships, *Statistical methods, Antecedent precipitation, Rainfall, Precipitation (Atmospheric), Regression analysis, Hydrograph analysis, Equations, Runoff forecasting, Depth-area-duration analysis, Infiltration.
Identifiers: *New Brunswick (Canada).

Prediction equations have been derived for forecasting runoff volume for regions within the Province of New Brunswick. Five basins were selected so as to provide a regionally representative distribution over the province. The prediction equations are based on the storm rainfall, antecedent precipitation index, base flow and week number in which the storm occurred. Statistical methods were used to obtain the least-squares multiple linear regression equation, correlation coefficient, and the standard error for each of the techniques used for the watersheds. The number of storms varied from 8 to 23 for the basins studied. The standard error of the optimum prediction equations for runoff ranged from 0.065 inches to 0.212 inches and the multiple correlation coefficient (R) varied from 0.556 to 0.963. The results of the regression equations developed for one basin were extended to a neighboring basin of similar hydrological characteristics but with only recent streamflow records. (Knapp-USGS)
W70-07904

RAINFALL-RUNOFF RELATIONSHIPS EXPRESSED BY DISTRIBUTION PARAMETERS,
Toronto Univ. (Ontario). Dept. of Civil Engineering.
Emil O. Frind.
Journal of Hydrology, Vol 9, No 4, p 405-426, December 1969. 22 p, 10 fig, 15 ref.

Descriptors: *Rainfall-runoff relationships, *Statistical models, Statistics, Parametric hydrology, Runoff forecasting, Recession curves, Simulation analysis, Synthetic hydrology, Mathematical models, Computer models, Probability, Stochastic processes.
Identifiers: Log normal distributions, Gamma distributions.

The statistical parameters of precipitation and runoff, and the interrelations between corresponding parameters involve three processes: the input process (mean annual effective precipitation), the transformation process (basin storage), and the output process (mean annual runoff). The input is assumed to be a pure-random series, with known statistical parameters. The transformation is characterized by an exponential recession curve with one parameter. With these assumptions, equations are developed expressing the statistical parameters of the output for any length of carryover. The validity of these equations is confirmed by means of computer-simulated series, which are analyzed for their moments. The type of distribution of the output is also established. (Knapp-USGS)
W70-07905

2B. Precipitation

AN INVESTIGATION OF CLOUDS AND PRECIPITATION FOR THE TEXAS HIGH PLAINS,
Texas Univ., Austin. Coll. of Engineering.
Donald R. Haragan.
Texas Water Development Board Report III, Mar 1970. 126 p, 30 fig, 18 tab, 25 ref, 4 append. Texas Water Development Board Grant IAC (68-69) - 175.

Descriptors: *Meteorology, *Synoptic analysis, *Texas, *Climatology, Clouds, Precipitation (Atmospheric), Droughts, Cloud seeding, Distribution patterns, Meteorological data, Weather data, Data collections.
Identifiers: High Plains (Texas).

A study of the relationship among cloudiness, precipitable water vapor, water vapor flux, stability and precipitation is presented for the Texas High Plains. A cloud census gives the annual and diurnal variations of cloud types and amounts in the area. The most common cloud types are altocumulus and cirrus. Total cloud cover is greatest during winter and least during fall. During periods of above normal rainfall, precipitation during late fall and winter is associated with stratiform clouds and cyclonic activity. Spring and summer precipitation is most highly correlated with cumuliform clouds. Periods of above normal precipitation in the plains area are associated with above normal cloud amounts, while dry periods are generally lacking in clouds. An exception is summer cumulus which occurs during both dry and wet periods. Wet periods are further characterized by atmospheric instability and above normal values of precipitable water vapor and water vapor transport. Dry periods are associated with atmospheric circulation patterns which either serve to cut off the supply of low-level moisture, produce subsidence and consequent atmospheric stability, or both. Occasionally, however, sufficient clouds are present during dry periods in conjunction with adequate supplies of precipitable water and the absence of upper level stability to hold promise for artificial cloud modification experiments. A STUDY OF ARIDITY AND DROUGHTS AT VISAKHAPATNAM,
Andhra Univ., Waltair (India).
V. P. Subrahmanyam, and C. V. S. Sastri.
Annals of Arid Zone, Vol 8, No 1, p 18-22, Mar 1969. 5 fig, 2 tab, 4 ref.

Descriptors: *Water balance, *Droughts, *Arid climates, *Semi-arid climates, *Moisture deficit, Consumptive use, Hydrologic budget, Precipitation, Climatic data.
Identifiers: *India, *Aridity index.

Drought is a term of limited meaning involving a condition of water deficiency while aridity is a climatic term of wide connotation. The aridity index was developed for classification of climates and is the ratio of annual water deficit to annual water need. Yearly aridity indices for Visakhapatnam, India, were calculated for the years 1891-1965 according to a standard book-keeping procedure for water balance. The data indicate that drought intensities cannot be assessed purely on the basis of precipitation since water deficits do not necessarily vary with rainfall. It is concluded that disastrous droughts are the results not of total rainfall but of maldistribution of rainfall, and that drought duration is as crucial to water balance as drought intensity. THE CLIMATE OF CITIES,
William P. Lowry.
Scientific American, Vol. 217, No. 2, p. 15-24, August 1967. 14 fig.

Descriptors: *Precipitation (Atmospheric), *Air temperature, *Climates, Fog, Smoke, Humidity, Absorption, Solar radiation, Cloud cover.
Identifiers: *Heat isaldn, *Dust dome, Infrared photography, Thermograph.

The five basic reasons for the variations in climate between the cities and the countryside included: (1) Greater absorption of heat energy by surface materials in the city than in the countryside; (2) The greater variation in shapes and orientation of structures; (3) Increased number of particulates in the air above the city; (4) Extra generation of heat in the city; and (5) Distinctly different ways of disposing of precipitation, leading to less cooling. These basic influences apply to a city during the course of a day. As the sun comes up, slow circulation of air between the city and the suburbs occurs due to the reflection of rays and absorption of heat caused by the walls in the city. At midday little difference in temperature could be detected between the city and the suburbs. In the late afternoon, however, a marked difference was observed. At night, the suburbs cooled more rapidly. Other observed characteristics of the city included a 'dust dome,' a heat island, loss of sunlight, frequency of fogs, and increased precipitation. In summary, the variables of climate are profoundly affected by the physical characteristics and human activities of a city. Those living in the city have lower heating bills, fewer days with snow, and a longer gardening season. (Osborne-Vanderbilt)

2D. Evaporation and Transpiration

PRESENT DAY EVAPORATION MEASUREMENT TECHNIQUES,
Geological Survey, Denver, Colo.
G. Earl Harbeck, Jr., and J. Stuart Meyers.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY7, Paper 7388, p 1381-1390, July 1970. 10 p, 2 fig, 1 tab, 14 ref, append.

Descriptors: *Reservoir evaporation, *Reservoirs, *Mass transfer, *Energy budget, Solar radiation, Water measurement, Costs, Evaporation, Water loss.
Identifiers: Falcon Reservoir (US-Mexico).

The energy-budget and mass-transfer methods are currently being used by the U.S. Geological Survey to measure evaporation from lakes and reservoirs. Because the field equipment is expensive and data processing and analysis are time consuming, the use of the energy-budget method is limited to those reservoirs where the need for detailed information warrants the expense.Ordinarily the mass-transfer coefficient for a selected reservoir is determined using the energy--budget method over a period of 15 months or longer. After this, the energy-budget equipment can be removed, and the mass-transfer method, which requires a minimum of equipment and office work, can be used to compute evaporation on a continuing basis. During 1965-67 a cooperative study by the International Boundary and Water Commission and the Geological Survey showed that evaporation from Falcon Reservoir on the Rio Grande was 189 cm and 167 cm for two successive years. (Knapp-USGS)
W70-07664

GENERAL CIRCULATION OF WATER MASSES IN THE RED SEA,
Woods Hole Oceanographic Institution, Mass.
G. Siedler.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 131-137, 1969. 7 p, 7 fig, 32 ref.

Descriptors: *Currents (Water), *Salinity, Density currents, Evaporation, Water temperature, Winds, Oceanography, Mapping, Climates, Arid lands.
Identifiers: *Red Sea.

A summary is given of the main features of the Red Sea circulation caused by evaporation and wind stress. Average temperature and salinity distributions are discussed, and some estimates of the water budget and water renewal times are calculated. (See also W70-07394). (Knapp-USGS)
W70-07684

EVAPORATION, POTENTIAL EVAPOTRANSPIRATION IN LEBANON, AND CALCULATED PICHE COEFFICIENT (IN FRENCH),
Food and Agriculture Organization of the United Nations, Tal-Amara (Lebanon); and Lebanon Agricultural Research Inst., Tal-Amara. Dept. of Irrigation Engineering.
S. Sarraf, N. Vink, and A. Aboukhaled.
English summary. Magnon, Serie Scientifique, Publication No 32, Dec 1969. 29 p, 6 fig, 5 tab, 4 append.

Descriptors: *Evaporation, *Evapotranspiration, Climatology, Irrigation, Irrigation effects, Lysimeters, Microenvironment, Evaporation pans, Arid lands, Semiarid climates.
Identifiers: *Potential evapotranspiration, *Lebanon.

Evaporation and potential evapotranspiration (PET) data were reported for the Coastal Plain and Central Bedaa Valley of Lebanon over the years 1966-1969. Evaporation and PET were measured at two stations in each area: Tal-Amara and Terbol (Central Bekaa) and Abde and Tyr (Coastal Plain). PET values were obtained in the Central Bekaa through the use of 4 square-meter and 0.26 square-meter drainage lysimeters. On a monthly basis, PET agreement between the two lysimeter sizes was good. Measured PET values from Tal-Amara exceeded those from Terbol by 10%. This was probably due to lack of irrigation near Tal-Amara as compared to extensive irrigation near Terbol. During the April-September irrigation seasons in 1968 and 1969, evaporation in the Central Bekaa exceeded evaporation on the Coast by 16% (calculated by the Penman method), 23% (sunken Colorado pan), and 33% (class A pan). For this same period measured PET was approximately 1100 mm in the Central Bekaa and 800 mm on the Coast. The authors suggested suing a seasonal alpha coefficient (Bouchet formula) of 0.34 for the Lebanese Coast and 0.26 for the irrigated lands in the Central Bekaa Valley. (Carr-Arizona)
W70-07768

A GENERALISED COMPUTER PROGRAM FOR THE SOLUTION OF THE PENMAN EQUATION FOR EVAPOTRANSPIRATION,
Aston Univ., Birmingham (England).
Thomas R E. Chidley, and John G. Pike.
Journal of Hydrology, Vol 10, No 1, p 75-89, Jan 1970. 15 p, 1 tab, 6 ref, 5 append.

Descriptors: *Evapotranspiration, *Consumptive use, Meteorological data, *Solutions, *Computer programs, *Computer programming, Hydrology.
Identifiers: *Penman equation, Potential evaporation, ALGOL, Water budget.

A generalized computer program that has a wide application with regard to location and variety of input data is given for solving the Penman equation for evapotranspiration. The form of output is designed to provide an immediate record of potential evaporation rates and a summary of the meteorological data used. The main elements of the Penman equation are in self-contained blocks, enabling changes to be made in some of the sections of the program to allow for more advanced methods. Possible lines of development of this program are: (1) More sophisticated procedures for computing the saturation vapor pressure and the slope of the saturation vapor pressure for differing

conditions. The formulas used in the program apply only to conditions over water at normal pressure. (2) From the point where the program begins to substitute the time-averaged data into the Penman equation, the whole program, excluding output, could be written as an ALGOL procedure, enabling the formula to be more readily incorporated within the body of other programs, such as water budget problems. (3) The aerodynamic term could be modified to include a wind term based on wind profile theory incorporating surface roughness to give more reliable estimates for short time periods. (USBR)
W70-07877

FOREST HYDROLOGY IN A KARSTIC REGION OF SOUTHERN AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Adelaide (Australia). Div. of Soils.
J. W. Holmes, and J. S. Colville.
Journal of Hydrology, Vol 10, No 1, p 59-74, January 1970. 16 p, 9 fig, 3 tab, 4 ref.

Descriptors: *Evaporation, *Forests, *Pine trees, *Water balance, Solar radiation, Rainfall, Infiltration, Soil water, Groundwater, Water table, Recharge, Water level fluctuations, Water utilization, Consumptive use, Demonstration watersheds.
Identifiers: *Australia, Gambier Plain.

Evaporation was measured in two stands of Pinus radiata in southern Australia at a location of 141 deg E, 38 deg S. The predominantly winter rainfall of about 600 mm was almost all evaporated by early summer and therefore no recharge of the local aquifer, by deep infiltration, occurred beneath the forest. The evaporation from forest during winter and spring was up to 2.2 times that from grassland. There was no soil water stress during this period but an explanation is needed for the supply of energy used in forest evaporation. The forest albedo is less than that of the pasture but the extra radiation energy absorbed by the forest is insufficient to explain all the increase of evaporation. Advection of sensible heat from the neighboring grassland is sometimes sufficient to explain the greater evaporation from the forests. It is thought that subsidence of continental air masses supplies an appreciable component of the energy budget. Also, advection from the Southern Ocean may supply energy to this part of southern Australia during winter and early spring. (Knapp-USGS)
W70-07901

GRASSLAND HYDROLOGY IN A KARSTIC REGION OF SOUTHERN AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Adelaide (Australia). Div. of Soils.
J. W. Holmes, and J. S. Colville.
Journal of Hydrology, Vol 10, No 1, p 38-58, January 1970. 21 p, 11 fig, 4 tab, 11 ref.

Descriptors: *Water requirements, *Irrigation water, *Hydrologic budget, *Grasslands, *Karst, Recharge, Evapotranspiration, Groundwater, Water table, Lysimeters, Nuclear mositure meters, Rainfall, Water utilization, Consumptive use, Water balance.
Identifiers: *Australia, Gambier Plain.

The water balance of grassland on the Gambier Plain, Australia, about 24 miles from the Southern Ocean, was investigated using lysimeters and neutron moisture meters. For the years 1961-1965, precipitation was 632 mm, evaporation was 588 mm, and underground drainage to a water table aquifer in Tertiary limestone was 63 mm. The balance item of -19 mm represents change in soil water content. The total recharge of the groundwater was estimated to be about 430,000 acre-feet per year from an area of 3 million hectares. The irrigation potential was assessed to be about 150,000 ha, from the annual recharge of the groundwater resource. In the highest rainfall region which has an area of 350,000 ha, about one quarter of the land could be irrigated by local groundwater. (Knapp-USGS)

TRANSIENT AND ASYMPTOTIC BEHAVIOUR OF RESERVOIRS WITH NON-PERSISTENT SEASONAL INFLOWS,
Lancaster Univ., Bailrigg (England).
E. H. Lloyd.
Journal of Hydrology, Vol 10, No 3, p 243-258, April 1970. 16 p, 6 ref.

Descriptors: *Reservoir storage, *Mathematical models, *Stochastic processes, *Statistical models, Streamflow forecasting, Statistics, Reservoir yield, Reservoir operation, Markov processes.
Identifiers: Reservoir forecasting, Reservoir management.

A mathematical model for a reservoir system comprises stochastic inflow, storage, and outflow. It has been shown that, when one approximates the continuum of water quantity by discrete units, and continuous time by discrete epochs, the sequence of statistically independent inflows gives rise to a Markovian sequence of reservoir contents. A complete solution contains a time-dependent ('transient') term, involving the initial configuration of the reservoir, as well as a constant ('asymptotic') component, which is independent of the initial conditions. In order to facilitate the solution, the Langbein model has been further simplified by coarsening the subdivision of the reservoir to only three states - empty, half-full and completely full. DYNAMICS OF AN ARIZONA TRAVERTINE-FORMING STREAM,
Arizona State Univ., Tempe.
Gerald A. Cole, and George L. Batchelder.
Journal of the Arizona Academy of Sciences, Vol 5, No 4, p 271-283, October 1968. 3 fig, 6 tab, 40 ref.

Descriptors: *Travertine, *Calcium carbonate, *Discharge measurements, *Surface-groundwater relationships, *Carbon dioxide, Calcite, Calcium compounds, Hardness (Water), Alkalinity, Hydrogen ion concentration, Water properties, Oxygen, Cations, Anions, Magnesium, Arizona.
Identifiers: *Limnocrene environments, *Montezuma well, Oxygen productivity, Total equivalents.

Waters leaving a limnocrene environment, Montezuma Well, Yavapai County, Arizona, were studied at 3 successive stations downstream from the well outlet in June and December, 1968. In all instances there was a loss of total millequivalents of principal ions per liter between stations I-III and II-III and a slight gain between stations I-II. Computed oxygen productivity was considered comparable to most eutrophic waters. About 90 percent of the free carbon dioxide was lost from the outlet to station III, in June, amounting to an average of 1.0 to 1.7 mg/liter/minute. In October the range was 1.6-1.7 mg/liter/minute. At stations II and III, the pH increased with carbon dioxide losses, amounting to 0.72 and 0.23 untis in June and 0.76 and 0.07 units in October. It was speculated that the free carbon dioxide content in incoming waters may be highly variable. Cl, Na, K, Mg and sulfate ions were constant at all stations. Microparticulate calcium carbonate caused differences in alkalinity and hardness figures, and a mean of 88.8 kilograms per day of calcium carbonate was deposited between stations II and III, or about 4 percent of the amount in the flow per hour. RELATION OF SEA WATER TO FRESH WATER IN CARBONATE ROCKS IN COASTAL AREAS, WITH SPECIAL REFERENCE TO FLORIDA, U.S.A., AND CEPHALONIA (KEPHALLINIA), GREECE,
Geological Survey, Washington, D.C.
V. T. Stringfield, and H. E. LeGrand.
Journal of Hydrology, Vol 9, No 4, p 387-404, December 1969. 18 p, 9 fig, 18 ref.

Descriptors: *Groundwater movement, *Saline water intrusion, *Karst, *Florida, Aquifers, Salinity, Sea water, Saline water systems, Sinks, Springs, Lakes, Density, Water circulation, Hydrogeology.
Identifiers: Cephalonia (Greece).

The principles controlling the equilibrium between the denser salty water and the lighter fresh water in coastal aquifers apply to carbonate as well as sand systems. However, under certain equilibrium conditions of fresh and salt water in parts of some carbonate aquifers unusual hydrologic phenomena result. Hydrologic conditions at Tarpon Springs, Florida, and Cephalonia, Greece, include deep vertical openings as sinkholes through a relatively impervious part of the aquifer system. In both cases the tops of the sinkholes or natural wells are exposed to sea water. At Tarpon Springs the dynamic equilibrium between salt water and fresh water fluctuates so that the flow of salt water from the spring to a lake 2 miles away is sometimes reversed. At Cephalonia, the head of fresh water does not exceed the head of salty water in the sinkholes; the flow of sea water into the aquifer, aided by a shallow channel from the sea, is continuous, and the water level in the sinkhole is continuously depressed below sea level. Both cases represent a partially confined U-tube system where water at the seaward, sinkhole end is denser than at the other end and where a low fresh-water head is less than the salt-water head. U-234/U-238 DISEQUILIBRIUM AS AN AID TO HYDROLOGIC STUDY OF THE FLORIDAN AQUIFER,
Florida State Univ., Tallahassee. Dept. of Geology.
M. I. Kaufman, H. S. Rydell, and J. K. Osmond.
Journal of Hydrology, Vol 9, No 4, p 374-386, December 1969. 13 p, 7 fig, 1 tab, 23 ref. Project A-005-FLA.

Descriptors: *Tracking techniques, *Groundwater, *Florida, *Uranium radioisotopes, Tracers, Karst, Aquifers, Hydrogeology, Radioactivity techniques, Permeability, Groundwater movement, Water chemistry, Trace elements.
Identifiers: Floridan aquifer.

Investigation of the distribution and environmental disequilibrium patterns of naturally occurring uranium isotopes (U-234, U-238) in waters of the Floridan aquifer in north Florida, utilizing the analytical methods of isotope dilution and alpha-particle spectrometry, indicates that variations in isotopic activity ratios and concentrations are related to the regional hydrogeologic framework. Interpretation is possible in terms of regional permeability characteristics including the existence of hydrologic barriers, groundwater circulation patterns, sources of waters from various parts of the hydrologic environment, and areas of extensive Pleistocene leaching within the Floridan aquifer. 2G. Water in Soils

CHANGES IN SOIL NUTRIENT STATUS RESULTING FROM OVERGRAZING AND THEIR CONSEQUENCES IN PLANT COMMUNITIES OF SEMI-ARID AREAS,
University of New England, Armidale (Australia). Dept. of Botany
J. L. Charley, and S. W. Cowling
Proceedings of the Ecological Society of Australia, Vol 3, p 28-38, 1968. 3 fig, 6 tab, 30 ref

Descriptors: *Desert plants, *Cycling nutrients, *Essential nutrients, *Organic matter, Nitrogen, Phosphorus, On-site data collection, Soil-water-plant relationships, Nutrient requirements, Erosion, Arid lands, Biomass, Annual turnover, Productivity, Degradation (Decomposition).
Identifiers: *Australia, Degraded areas.

It is argued that limitation of essential nutrients and not water are the limiting factors in plant biomass in arid regions. Nitrogen content in the soil is largely a function of nodulating legumes and input is limited by active plant growth. Arid regions have less N than humid regions and Australia has less than other arid regions. Soil organic matter is low in deserts because sparse rainfall limits decay periods. Soil phosporus is little affected by climatic factors or natural input and is mainly governed by the P content of parent material. Soils at the lower end of the fertility spectrum show the greatest relative accumulation of nutrients near the surface and organic carbon, total N and available P and nitrate production fall away sharply with increasing depth. Measurements in a saltbush community showed that the total leaf and fruit litter fall for a year was greater than the weight of leaf held in the community, indicating a high recycling rate. In an overgrazed area with a soil truncation fo 10 cm due to erosion it was estimated that 35% of total circulating N, 45% of organic matter and greater than 22% of an already low P is lost. Efforts to furrow the area and eliminate grazing did not increase plant production. It was concluded that probably not lack of rainfall but low P limited N production and the whole system of nutrients is delicately balanced by a high recycling process which is easily disturbed. (Casey-Arizona)

HYDRAULIC CONDUCTIVITY AND CERTAIN SOIL CHARACTERISTICS OF SUBSOILS WITH SPECIAL REFERENCE TO DRAINAGE DESIGN IN THE ALLUVIAL SOILS OF U.A.R.,
Ain Shams Univ., Cairo (Egypt). Dept. of Soils.
Hassan Hamdi, Salah El Din Metwally, and Bishay Guindi.
Journal of Soil Science of the U.A.R., Vol 8, No 1, p 51-70, 1968. 4 tab, 13 ref.

Descriptors: *Hydraulic conductivity, *Drainage, *Groundwater movement, *Permeability, *Soil texture, Compaction, Fractures (Geology), Alluvium, Anion exchange, Cation adsorption, Electrical conductivity, Clays, Fine-textured soils, Sediments, Impermeability, On-site tests, Drilling, Soil surveys, Soil chemical properties, Soil physical properties, Drains, Data collections.
Identifiers: United Arab Republic.

The proper orientation and placement of drains relative to the most permeable layers of the soil profile is considered a function of hydraulic conductivity. Previously the hydraulic conductivities of alluvial soil in the U.A.R. were determined by studying soil texture. This study utilized the auger hole method, below the water table, to determine relationships between hydraulic conductivity and various soil characteristics: electrical conductivity, soluble anions, SAR, and exchangeable cations. None were found. Additionally, no apparent relationships between hydraulic conductivity and various textural fractions could be established. It was concluded that the hydraulic conductivity, for a given soil volume, is a function of various passageways for water, such as cleavages and fissures. These channels cannot be determined by textural analyses and it is therefore inadvisable to use textural characteristics alone as a criterion for drain spacing. Also, impermeable layers are probably the result of some interaction between: (1) A high percentage of fine clay combining with the high water table, causing stratification, and (2) Compression of deep layers by overlying surface layers resulting in less aeration. THE QUANTITATIVE DESCRIPTION OF SOIL MOISTURE STATES IN NATURAL HABITATS WITH SPECIAL REFERENCE TO MOIST SOILS,
University Coll. of Wales, Aberystwyth.
V. I. Stewart, and W. A. Adams.
Measurement of Environmental Factors in Terrestrial Ecology, Blackwell Scientific Publications, p 161-173, 1968. 1 fig, 3 tab, 6 ref.

Descriptors: *Drainage, *Moisture content, *Soil water, *Porosity, *Soil moisture, Field capacity, Soil profiles, Soil horizons, Soil properties, Soil investigations, Soil water movements, Sampling, Pore sizes, Cores, Retention.
Identifiers: *pF values, *Waterlogged percentage, *Drainage state, *Gley characters, *Soil wetness measures, Sampling depth, Intact field cores, Soil retentivity, Moisture release curve, Site characteristics.

Pedologists assess drainage state on the basis of gley characters which are unsupported by any quantitative evidence relating significance for drainage to actual moisture states. In an effort to express difference in degree of soil wetness on an understandable comparative basis, several techniques are considered: (1) The most appropriate sampling occasions; (2) Measurement locale; (3) Sampling types; (4) Relevant concepts of wetness and the consequent required type of measurement. Sampling should be restricted to field capacity days and samples should be compared to standard samples from freely drained soil. Sampling should also be confined to clearly defined described horizons from which intact field cores of known volume are taken. Percentage pore space filled with water is considered the best parameter of soil wetness and should be described as 'percent waterlogged'. The pF value as a measure of soil moisture states is discussed and it is recommended that field cores be equilibrated at pF2 and weighed. A graph of percent waterlogged on field capacity day versus percent waterlogged at pF 2 then facilitates a distinction between horizons poorly drained because of site and horizons probably waterlogged because of retentivity. COMPARISON OF METHODS FOR CALCULATING VERTICAL DRAINAGE AND INFILTRATION FOR SOILS,
Agricultural Research Service, Phoenix, Ariz.
Frank D. Whisler, and Herman Bouwer.
Journal of Hydrology, Vol 10, No 1, p 1-19, Jan 1970. 19 p, 13 fig, 1 tab, 20 ref.

Descriptors: *Drainage, *Infiltration, *Soils, Capillary conductivity, Soil water movement, Numerical analysis, Numerical method, Methodology, Equations, Porous media, Capillary tubes, Groundwater flow, Unsaturated flow, Hydraulic conductivity, Saturated flow, Bibliographies, Drainage engineering, Moisture uptake, Theoretical analysis.

Identifiers: *Comparative studies, Infiltration rate, Soil columns, Water absorption tests, Permeability tests.

The Youngs, Gardner, Ligon, and numerical analysis techniques for calculating the amounts of one-dimensional, vertical drainage from soil are discussed and compared with each other and with observed data. The same was done with the Green and Ampt, Philip, and numerical analysis methods for calculating the amounts of infiltration into soil profiles. The numerical analysis methods gave the best agreement with the observations, but required considerable input data, and the calculation procedure was not simple. The Youngs drainage equation and the Green and Ampt infiltration equation were the easiest to use, giving reasonably accurate results that are probably sufficient for most field problems. (USBR)

HYSTERESIS OF PORE WATER IN GRANULAR POROUS BODIES,
Agricultural Research Council, Cambridge (England).
A. Poulovassilis.
Soil Sciences, Vol 109, No 1, p 5-12, Jan 1970. 8 p, 10 fig, 1 tab, 5 ref.

Descriptors: *Hysteresis, *Porous materials, *Porous media, Wetting, *Granular materials, Sands, Hydraulic conductivity, Moisture content, Drying, Soil science, Soil engineering, Forecasting, Laboratory tests.
Identifiers: Suction, *Pore water, Soil columns, Soil suction.

Experimental results concerning the hysteresis behavior of granular porous bodies are compared with the predictions of the independent domain concept. A dynamic method is described for the direct determination of the relationships between moisture content and suction and moisture content and hydraulic conductivity on long vertical columns. Some experimental results concerning the hysteresis of the hydraulic conductivity are reported. To achieve the desired results, it was necessary to devise a method of stabilizing the geometry of a granular porous body, over long periods and over many reversals of wetting and drying, more generally applicable than in sintering. The method adopted was to work with deep columns of material and to stabilize the geometry by overburden pressure. (USBR)

2H. Lakes

STRATIFICATION OF FLOW FROM CHANNEL INTO DEEP LAKE,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
Heinz Stefan.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY7, Paper 7401, p 1417-1434, July 1970. 18 p, 10 fig, 8 ref, append.

Descriptors: *Stratified flow, *Heated water, *Thermal powerplants, *Outlets, *Hydraulic models, Thermal pollution, Lakes, Oceans, Model studies, Discharge (Water), Thermal stratification, Density stratification, Outlet works, Cooling water, Open channel flow, Reservoirs, Water temperature, Water quality, Water quality control, Water pollution control.
Identifiers: Thermal discharges.

The flow of heated water from an open channel into a reservoir containing colder and essentially stagnant water was studied in a laboratory flume. The basic mechanisms studied can produce a variety of substantially different flow patterns. The combined effects of buoyancy, viscosity, and stratification conditions in the reservoir on the flow are shown qualitatively in the case of a two-layered system. The information obtained may be used to design and operate heated water outlets and outfalls in lakes and oceans. (Knapp-USGS)

SIZE OF CENTRIC DIATOMS AS AN ECOLOGICAL INDICATOR,
Instituto de Investigaciones Pesqueras, Barcelona (Spain).
Ramon Margalef.
Mitteilungen Internationale Vereinigung fur Theoretische und Angewandte Limnologie, Vol 17, p 202-210, 1969. 4 fig, 1 tab, 16 ref.

Descriptors: *Diatoms, *Ecology, *Indicators, *Lakes, Size, Temperature, Salinity, Nutrients, Sediments, Seasonal, Zooplankton, Environmental effects.
Identifiers: *Centric diatoms, Skeletonema, Melosira arenaria, Melosira sulcata, Italy, Vigo Bay (Spain), Polymorphic, Coscinodiscus nodulifer, Woods Hole (Mass), Pyrenees, Fossil lake, Cyclotella bodanica, Stephanodiscus, Cyclotella comensis, Fragilaria crotonensis, Lake Maggiore (Italy), Lake Mergozzo (Italy), Size fluctuations.

Some published information is reviewed and new evidence presented concerning diatoms of the Italian lakes. Distribution of Melosira sulcata suggests that environmental influence on populations may act through differential selection of discrete morphs and through phenogenetic reaction of the cells in each morph. The data from Vigo Bay (Spain) suggest that salinity influences size of Melosira sulcata, and, under lowered salinity, higher diameters are more common. Nutrient concentration is probably also relevant. Observation of present and past sediments point to association between larger diameter of frustules and highly productive water in recent sediments, or a higher content of plant pigments in older ones. A large species of Stephanodiscus was common in certain periods of the lake's existence and exhibited, like other diatoms, insignificant differences in the average diameter. It is tentatively suggested that a notable fluctuation in size may be due to seasonal changes in water temperature and that, as today, frustules sedimented in summer are on the average thinner than those deposited in colder seasons. Specimens of Cyclotella bodanica were measured from two small cores of sediment from Lago Maggiore and Lago di Mergozzo suitable for checking changes of size with time. (Jones-Wisconsin)

AQUATIC PLANT SURVEY OF MAJOR LAKES IN THE MILWAUKEE RIVER WATERSHED,
Wisconsin Dept. of Natural Resources, Madison.
Richard F. Modlin.
Department of Natural Resources, Madison, Wisconsin, Research Report No 52, 1970. 45 p, 1 fig, 4 tab, 10 ref, 17 photos.

Descriptors: *Aquatic plants, *Surveys, *Lakes, *Wisconsin, Watersheds (Basins), Chara, Cattails, Bulrush, Sago pondweed, Sampling, Water quality, Geographical regions, Geology, Limnology, Bottom sediments, Fertility, Weed control.
Identifiers: *Milwaukee River (Wis), Typha, Scirpus validus, Potamogeton pectinatus, Nymphaea tuberosa, Chara, Nuisance growths, Myriophyllum, Sagittaria, Anacharis, Najas, Lemna, Eleocharis, Carex, Ceratophyllum, Cyperus, Sparganium, Acorus, Asolepias, Brasenia, Caltha, Decodon, Equisetum.

Twenty-three lakes of the Milwaulkee River watershed were surveyed from June to September 1968, to record aquatic vegetation abundance and species composition; 39 genera and 61 species were identified. The greatest variety recorded in any single lake was 24 genera and 34 species. Stonewort (Chara), cattail (Typha), softstem bulrush (Scirpus validus), sago pondweed (Potamogeton pectinatus), and while water lily (Nymphaea tuberosa) occurred most extensively and in greatest abundance. Some variations in abundance and dominance were noticed over the summer. Marl lakes of the northeast basin and the tea-colored lakes of the northwest basin contained a very small biomass and scattered plant distribution, while the other lakes had a very large biomass and continuous distribution of plants. The importance of lake vegetation cannot be minimized but overabundance of any specie will interfere with lake usage. Enrichment, pollution, and other unnatural conditions may trigger prolification. Some shorelines could be improved by encouraging growth of specific emergent and floating aquatics. Arrowheads, milkweed, water lilies, and pickerelweed flower throughout most of the summer, adding color to a lakeshore. Such improvements would be especially important on lakes in or near metropolitan areas. (Jones-Wisconsin)

THE NEWEST DEVELOPMENT IN LAKE LUCERNE (IN GERMAN),
Eidgenoessische Technische Hochschule, Zurich (Switzerland).
H. Ambuhl.
English summary.

Descriptors: *Lakes, *Oxygen, Phosphorus, Nitrogen, Stratification, Winds, Eutrophication, Fertilization, Oligotrophy, Primary productivity.
Identifiers: Oxygen consumption, Lake Lucerne, Kreutztricher, Obermatt, Gersauer See, Urnersee.

Limnological investigations, conducted during the last 9 years, disclosed the highest oxygen consumption in the oligotrophic part of the lake, exposed to the most intensive mixing by strong and persistent winds. During the past 5 years, the annual average of total phosphorus was doubled, and the nitrate content increased in the last 7 years from 0.34 to 45 milligram/liter nitrogen. Fertilizing experiments, employing plastic bags, have indicated that phosphorus is the most important growth-limiting factor, responsible for the increase of eutrophication and primary production. (Wilde-Wisconsin)

2I. Water in Plants

SOIL-PLANT RELATIONSHIPS OF TWO STEPPE DESERT SHRUBS,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
W. H. Rickard, and R. F. Keough.
Plant and Soil, Vol 29, No 2, p 205-212, Oct 1968. 1 fig, 5 tab, 8 ref.

Descriptors: *Deserts, *Desert plants, *Shrubs, *Plant physiology, *Cation exchange, Zerophytes, Arid lands, Soil-water-plant relationships, Washington, Soil profiles, Soil chemical properties, Potassium, Sodium, Leaves, On-site investigations.
Identifiers: *Leaf litter.

An eastern Washington plant community in which the dominant shrubs are hopsage (Grayia spinosa) and greasewood (Sarcobatus vermiculatus) was studied to determine the effects of the plants on soil properties. Leaves and surface soil were analyzed for cationic and moisture contents. The leaf ash content, Na content and moisture were greater in greasewood leaves while K content was greater in hopsage leaves. With age the predominant cation of each species increased. The soil beneath the canopy of a plant showed a greater content of the predominant cation of that species than adjacent soil areas. Cheatgrass (Bromus tectorum) beneath greasewood had greater Na contents than cheatgrass growing in other areas, indicating it was taking up Na formerly incorporated in greasewood leaves. The chemical properties of the soil profile show increasing pH, exchangeable Na percentage and conductivity below 4 dm depths, and greater exchangeable K above 4 dm depths. It was concluded that the soil areas around these shrubs are being supplied with increments of K and Na faster than the low rainfall regime can leach them out. The significance of this in terms of the future of the plant community is unknown. (Casey-Arizona)

THE BIOLOGY OF THE LARKS (ALAUDIDAE) OF THE KALAHARI SANDVELD,
Cornell Univ., Ithaca, N.Y. Dept. of Ecology and Systematics.
G. L. Maclean.
Zoologica Africana, Vol 5, No 1, p 7-39, Mar 1970. 19 fig, 6 tab, 64 ref.

Descriptors: *Xerophilic animals, *Deserts, *Birds, *Nests, *Reproduction, Non-migratory birds, Non-game birds, Bird eggs, Clutch, Bird types, Vegetation, Precipitation, Arid lands, On-site investigation, Dunes, River beds, Breeding, Ecosystems, Calcium carbonate.
Identifiers: *Kalahari sandveld, *Nomadic birds, *Larks, *Calcrete, Feeding habits, South Africa.

Of all passerine birds the larks have shown the greatest degree of adaptive radiation in the arid regions of the Old World. This paper examines their ecology in the Kalahari sandveld, where mean annual rainfall predominately summer, is 226 mm and the yearly temperature range is -11 degrees C to 40 degrees C. Nomadic birds occur in various arid regions including the Kalahari and move over wide areas following weather conditions and other favorable environmental variables. Eight breeding species and one non-breeding species, both non-nomadic and nomadic, were described. Red larks live in dunes and grey larks on the calcrete. There is ecological separation in both areas by small differences in vegetation cover. All non-nomadic species were insectivorous which is a great water conservation advantage in arid lands. The nomadic species were all granivorous. Gradations in bill shapes indicated overlapping in feeding habits between insectivorous and granivorous birds. Breeding in all species was initiated by rainfall of at least 20 mm per month. Populations of nomadic species usually increased in breeding periods. The orientation of most nests was towards the east, southeast, or south, at the bases of bushes, insuring maximal protection from the sun. Breeding success averaged 17.9 percent for the family. BIOMASS OF DESERT WINTER ANNUAL PLANT POPULATIONS IN SOUTHERN NEVADA,
California Univ., Los Angeles. Lab. of Nuclear Medicine and Radiation Biology.
Janice C. Beatley.
Oikos, Vol 20, No 2, p 261-273, 1969. 3 fig, 2 tab, 12 ref.

Descriptors: *Deserts, *Desert plants, *Plant growth, *Productivity, *Biomass, Xerophytes, Arid lands, Arid climates, Growth stages, Mature growth stage, Vegetation establishment, Soil-water-plant relationships, Life cycles, Precipitation (Atmospheric), Nevada, Shrubs.
Identifiers: *Primary productivity, *Annuals, *Mojave desert, *Great Basin desert, Transition zone, Disturbed site.

In an effort to assess desert ecosystem primary productivity, the biomass of reproductively mature annuals was measured in a region including the Mojave Desert, the Great Basin Desert, and a transitional region. Sixty-eight separate sites, representing the principal kinds of ecosystems in 8 drainage basins, were studied during three successive spring growing seasons. Precipitation, edaphic variables, dominant shrubs and site disturbances were also studied in an effort to relate them to productivity. During the study period, extremes of germination success, growing season length, and density and size of individual plants were seen. Population distributions were so variable that in nearly two-thirds of the 203 sets of samples the mean dry weight of 20 samples/set was less than the standard deviation. Distribution at germination is a site characteristic and subsequent seedling distribution depends upon survival patterns, not absolute numbers. Year to year variations were great and not correlated with dominant shrub species or growing season lengths but were directly or indirectly related to rainfall. Burned sites were collectively 1.6-11 times as productive as undisturbed sites during the study period. Biomass over the three seasons was greatest in Mojave Desert communities, least in Great Basin communities. (Casey-Arizona)

CARBON DIOXIDE EXCHANGE OF SEEDLING PINES IN THE LABORATORY AS RELATED TO LOWER ELEVATION LIMITS,
Redlands Univ., Calif. Dept. of Biology.
R. D. Wright.
American Midland Naturalist, Vol 83, No 1, p 291-300, 1970. 3 fig, 3 tab, 15 ref.

Descriptors: *Elevation, *Photosynthesis, *Carbon dioxide, *Pine trees, *Drought tolerance, Plant physiology, Plant growth, Root development, Moisture stress, Photoactivation, Leaves, Soil-water-plant relationships, Arid lands, Thermal stress, Light intensity, Chaparral, Trees, California, Greenhouses.
Identifiers: *Elevational adaptations.

Three species of pine, P. attenuata (knobcone pine), P. coulteri (coulter pine) and P. lambertiana (sugar pine) were studied in an effort to determine adaptations relevent to the minimum elevations in their ranges. The former are trees of open chaparral while sugar pine occurs at higher elevations. Gross and net photosynthesis, under differing experimental conditions, were indirectly determined by measuring carbon dioxide exchange. Knobcone and coulter pines demonstrated lower photosynthetic efficiency in reduced light. Sugar pine produces both primary and secondary leaves in its first growth year while the others produce only primary leaves, whose photosynthetic efficiency was much greater, over a wide temperature range, than that of secondary leaves. This might account for greater early root growth in knobcone and coulter pines who also showed more photosynthesis during low temperature acclimation. This was interpreted as a gradient of decreasing drought avoidance since they are better able to utilize light during colder periods when moisture levels are higher at low elevations. Sugar pine was also less resistant to soil water stress. The ramifications of continued chaparral fire control on the future range extensions of knobcone and coulter pines are discussed. (Casey-Arizona)

WATER STRESS AND APICAL MORPHOGENESIS IN BARLEY,
Adelaide Univ. (Australia). Waite Agricultural Research Inst.
I. Husain, and D. Aspinall.
Annals of Botany, NS, Vol 34, No 135, p 393-407, March 1970. 6 fig, 7 tab, 19 ref.

Descriptors: *Moisture stress, *Plant physiology, *Barley, *Soil-water-plant relationships, *Plant growth, Soil moisture, Soil water, Moisture deficit, Moisture content, Water requirements, Leaves, Turgidity, Drought tolerance, Drought resistance, Photoperiodism, Light, Light intensity, Crop response.
Identifiers: *Apical meristem, *Morphogenesis, *Soil water potential, *Primordia, Plant response, Spikelets.

Levels of soil water potential (-1 bar and less) which had little effect on barley plant growth inhibited the formation of new primordia on the apical meristem. Even at water potential levels which completely suppressed primordium formation, leaf growth and morphogenesis of lateral spikelets on the developing ear proceeded at reduced rates. Changes in water potential in apical tissues apparently were not the cause of apex stress sensitivity, because primordium formation was inhibited even when apical water potential was unchanged. This sensitivity of the apex to stress did not appear to be affected by floral initiation. When the plant was exposed to an increased photoperiod, water stress suppressed response by the apical meristem. However, when stress was relieved there were some instances of delayed photo-periodic response. Rate of primordium formation rose in response to an increase in light intensity when water stress was at moderate levels. (Carr - Arizona)

GERMINATION REQUIREMENTS OF THE DESERT SHRUB LARREA DIVARICATA,
Duke Univ., Durham, N.C. Dept. of Botany.
Michael G. Barbour.
Ecology, Vol 49, No 5, p 915-923, Late Summer 1968. 5 fig, 5 tab, 24 ref.

Descriptors: *Germination, *Seeds, *Plant growth, *Desert plants, *Environmental effects, Environment, Habitats, Deserts, Arid lands, Arid climates, Xerophytes, Plant physiology, Sites, Reproduction, Seed treatment, Growth stages, Root development, Temperature, Sodium chloride, Osmotic pressure, Light, Soil-water-plant relationships, Water requirements, Soil moisture, Mortality.
Identifiers: *Creosotebush, Sonoran Desert, Mojave Desert, Chihuahuan Desert, Survival, Darkness.

Creosotebush seeds for use in laboratory studies of germination requirements were collected from 34 sites in 3 desert regions of the United States. Listed in order of increasing aridity, the 3 deserts were the Chihuahuan, Sonoran, and Mojave. Although no regional differences in germination behavior were found, optimum laboratory conditions for creosotebush germination included: darkness, temperatures of 23 deg. C, leaching of mericarps with running water, wetting and drying cycles, cold temperature exposure prior to sowing, low NaCl and near-zero osmotic pressure in the sand medium. Maximum root growth occured at 29 degrees C, slightly acidic medium, low NaCl, and near-zero osmotic pressure. Germination was markedly reduced when seeds were exposed to warm temperatures (37-71 degrees C) prior to sowing. Under optimum greenhouse conditions only 20 seedlings survived for every 100 mericarps sown at the beginning of the 6-month period. Mortality is probably much higher under natural conditions. THE PERFORMANCE OF THREE TYPES OF LEAF-WETNESS RECORDERS,
Israel Meteorological Service, Bet-Dagan. Agrometeorological Div.
J. Lomas, and Y. Shashoua.
Agricultural Meteorology, Vol 7, No 2, p 159-166, March 1970. 5 tab, 11 ref.

Descriptors: *Moisture, *Dew, *Leaves, *Measurement, *Equipment, Instrumentation, Performance, Semiarid climates, Humidity, Condensation, Air environment, Meteorology, Plants, Plant pathology, Time, Environmental effects, Environment, Research equipment.
Identifiers: *Leaf wetness, *Dew recorders, Israel, Relative humidity, Standard meteorological screen.

Duration of relative humidity (85 percent and above) in a standard meteorological screen was

compared with duration of leaf wetness recorded by freelyyexposed field instruments and Taylor instruments located within a crop canopy. Resulting data suggest that direct measurement within the crop is the only accurate method of determining duration of leaf wetness. Taylor-type leaf-wetness recorders were found to be suitable for this purpose. One reason for the interest in leaf wetness is that in semiarid climates duration of dew may be an important factor influencing outbreaks of plant diseases. (Carr - Arizona)

WATER RELATIONS OF THREE WARM DESERT SPECIES,
Nevada Univ., Reno. Desert Research Inst.; and Utah State Univ., Logan. Coll. of Natural Resources.
N. Stark, and L. D. Love.
Israel Journal of Botany, Vol 18, No 4, p 175-190, 1969. 8 fig, 1 tab, 18 ref. OWRR Project A-023-NEV.

Descriptors: *Moisture availability, *Distillation, *Condensation, *Soil water movement, *Evapotranspiration, Soil-water-plant relationships, California, Soil texture, Porosity, Soil types, Soil temperature, Dew, Frost, Climatology, Evaporation, Precipitation, Arid lands, On-site investigations, Phenology, Leaves.
Identifiers: *Death valley, *Relative saturation percentage, *Plant moisture content, Leaf parenchyma, Creosote bush, Pigmycedar, Desertholly, Hygrothermograph.

An area in Death Valley with dry air, persistent winds, low water table and 2-8 centimeters of rain annually, was studied in an effort to determine the sources of water available to plants and the abilities of three species, Atriplex hymenelytra (desertholly), Larrea divaricata (Creosote bush) and Peucephyllum schottii (Pigmycedar) to utilize them. Precipitation, aerial moisture, soil water, and distillation were considered potentially available water sources, and evaporation transpiration, and deep seepage, sources of water loss. Climatic, soil moisture, plant moisture content and transpiration data were obtained and correlated. During periods of higher rainfall deep soil moisture increased and was subsequently depleted at temperatures of less than 36-40 degrees centigrade by delivery to the surface soil through distillation and condensation on the undersides of larger rocks near the surface of the coarse soil. Above the hygroscopic level absolute soil moisture was not as important as water delivered by distillation, which was determined to compensate for loss through transpiration. Surface evaporation losses were insignificant, except shortly after rains, while transpiration rates varied with seasonal fluctuations in the plant water status. Larrea showed the greatest physiological adjustment capabilities to low water content and frost, Peucephyllum, the least. Whether the plants utilized aerial moisture was not definitely determined. PHYSIOLOGICAL ASPECTS OF DROUGHT DORMANCY IN GRASSES,
University of New England, Armidale (Australia). Dept. of Botany.
R. D. B. Whalley, and A. A. Davidson.
Proceedings of the Ecological Society of Australia, Vol 3, p 17-20, 1968. 1 fig, 3 ref.

Descriptors: *Plant physiology, *Desert plants, *Grasses, Vegetation, Arid lands, Soil-water-plant relationships, Xerophytes, On-site data collection, Plant growth.
Identifiers: *Dormancy, *Soil moisture stress, Reserve carbohydrates, Australia.

Dormancy in plants is characterized by growth cessation and specific adaptive physiological and structural changes. Plants of arid and semiarid climates often show the same growth and structural changes during periods of water stress and it is speculated that this condition is identical to dormancy. Seasonal dormancy of perennial grasses in humid environments show an increase in carbohydrate reserves in stem base and rhizome, and a decrease following renewed growth. Three species of perennial grasses native to a semi-arid area were regularly analyzed during the growing season for carbohydrates and this was correlated with soil moisture changes. It was found that reserve carbohydrate contents fluctuated the same way between soil moisture stress and rainfall as they do between dormancy and renewed growth. It was concluded that the reactions to soil moisture stress constituted true dormancy and was speculated that the physiological mechanisms are probably similar to those of photoperiod and thermoperiod-induced dormancy. (Casey - Arizona)

THE EFFECT OF SALINITY ON PERMEABILITY OF ROOTS TO WATER,
Arizona Univ., Tucson. Dept. of Biological Sciences; and Arizona Univ., Tucson. Environmental Research Lab.
J. W. O'Leary.
Israel Journal of Botany, Vol 18, No 1, p 1-9, 1969. 2 fig, 2 tab, 29 ref.

Descriptors: *Soil-water-plant relationships, *Root systems, *Osmotic pressure, *Water balance, *Salt tolerance, Turgidity, Permeability, Conductivity, Flow resistance, Biological properties, Resistance networks, Irrigation practices, Irrigation effects, Plant physiology.
Identifiers: *Plant water potential, *Relative water content, *Plant cell permeability, Salt water irrigation.

It was formerly thought that the osmotic pressure of cells of leaves and roots increased as the osmotic pressure of the solution around the roots increased. With constant turgor pressure there would be a corresponding adjustment of the plant water potential, maintaining a relatively constant plant water status. This theory was tested by starting kidney bean seedlings in nutrient solutions and transferring some to solutions of differing salinities. Root permeabilities were subsequently measured in pressure chambers. Water flow rate under pressure was much greater through roots of control plants than through those from saline solutions. The plants grown in saline solutions also showed greater leaf resistance to water vapor diffusion. The water status of the plants was determined by measuring relative water content (RWC) of primary and trifoliate leaves. The primary leaves did not differ in RWC but that of trifoliate leaves decreased with increasing salinity. It was concluded that root permeability decreases during growth in saline solutions and that this causes a great enough reduction of water delivery to the leaves resulting in decreased turgor. This is a form of physiological drought, and implies that irrigation with saline water would be most successful in areas of high humidity. Some methods of overcoming this problem in dry, arid areas are suggested. (Casey - Arizona)

DROUGHT RESISTANCE OF MONTEREY PINE NEEDLES,
Hebrew Univ., Jerusalem (Israel). Dept of Plant Physiology.
H. R. Oppenheimer.
Israel Journal of Botany, Vol 17, No 3, p 163-168, 1968. 1 fig, 3 tab, 14 ref.

Descriptors: *Plant physiology, *Pine trees, *Drought resistance, *Cuticle, *Stomata, Drought tolerance, Soil-water-plant relationships, Moisture deficit, Forced drying, Dehydration, Water requirements.
Identifiers: *Drought avoidance, *Stomatal closure, *Initial damage point, Israel.

Mature needle fascicles of Pinus radiata Don (Monterey pine) from the flushes of the three most recent years were subjected to slow dessication to determine drought resistance capabilities. Transpiration curves indicated a significantly inverse relationship between age and water deficit after 4 days. The initial damage point was reached at a water deficit of only 25 percent showing extreme susceptibility to dehydration. Since stomatal closure in excised needles occurred within 4 hours, subsequent water losses were considered cuticular and restriction of water loss in this phase did not prevent cell damage and early death. These results were compared with those obtained earlier from two more drought-resistant species, P. halepensis and P. pinea. It was concluded that differences in leaf drought resistance are mainly due to weaker leaf cutization in P. radiata, resulting in greater water loss per unit time. Drought tolerance was essentially the same in all three species indicating it is probably a generic property. The general phenomenon of increased transpiration in dying leaves was discussed. (Casey - Arizona)

ESTIMATION OF WATER STRESSES IN THE ROOT ZONE BY THE DOUBLE-ROOT SYSTEM TECHNIQUE,
Tel Aviv Univ. (Israel). Dept. of Botany.
Y. Waisel, and G. Pollak.
Israel Journal of Botany, Vol 18, No 3, p 123-128, 1969. 2 tab, 2 fig, 15 ref.

Descriptors: *Halophytes, *Wilting point, *Soil-water-plant relationships, *Osmotic pressure, Wilting, Transpiration, Moisture deficit, Plant physiology, Root zone, Moisture content, Circulation (Plants), Water balance.
Identifiers: *Water stress, *Split-root technique, *Adventitious roots, Israel, Non-wilting plants.

The water potentials in different plant organs may vary, but under steady state conditions will reach specific, stable, and related levels. Since halophytic plants in native habitats are subject to variable water stress in the active root zone, it would be useful to determine these stresses utilizing aboveground plant organs. Glass tubes were used as sleeves around the stems of potted plants. They were packed with heavy clay type soil, usually wetted, and sealed at both ends. Sunflowers developed adventitious roots in the sleeves; wilting points were determined by both direct and indirect methods, yielding identical results. Additionally, similar results were obtained with the sleeve technique using a halophytic, non-wilting species, Aeluropus litoralis. Aeluropus grown in nutrient solutions of differing NaCl and magnesium sulfate concentrations showed almost linear relationships between the salt concentrations and the water stress in the sleeved soil. Stressed plants grown under low and normal transpiration conditions showed similar sleeve water contents. It was concluded that water stresses of the soil around adventitious root systemsreflect those around the main root system and that this is due to osmotic adaptation in the auxiliary roots and is independent of temporary water stresses. ABSORPTION OF NA, CL, AND B BY DESERT SALTBUSH IN RELATION TO COMPOSITION OF NUTRIENT SOLUTION CULTURE,
California Univ., Riverside.
N. Jerry Chatterton, C. M. McKell, F. T. Bingham, and W. J. Clawson.
Agronomy Journal, Vol 62, No 3, p 351-352, May-June 1970. 2 fig, 1 tab, 6 ref.

Descriptors: *Absorption, *Salt tolerance, *Plant tissues, *Leaves, *Desert plants, Deserts, Arid lands, Environment, California, Sodium, Chlorine, Boron, Salts, Salinity, Chlorides, Inorganic compounds, Cultures, Ions, Halophytes, Plant morphology, Structure.
Identifiers: *Saltbush, *Trichomes, Mesophyll cells, Osmotic potential, Selective absorption.

Salt of tolerance of desert saltbush (Atriplex polycarpa (Torr.) S. Wats.) was thought to be related to its leaf anatomy. Therefore, experiments were conducted to study saltbush absorption of Na, Cl, and B in relation to concentration of these elements in water cultures. Plants were grown in NaCl solution cultures with osmotic potentials of -0.8, -10.0, -20.0, and -30.0 atm. Ten and 13% of Na and Cl, respectively, were found in the plants grown at -30.0 atm. Although large amounts of Na and Cl were accumulated in saltbush tissues, salt tolerance may be due to localization of salt in trichomes from adjacent mesophyll cells. This would reduce salt stress within photosynthetically active tissues. In the case of B, a selectivity mechanism operative in the roots reduces its absorption by saltbush and results in less B uptake than is common with many other plants. (Carr-Arizona)

Descriptors: *Plant growth regulators, *Moisture stress, *Osmosis, *Root zone, *Salt tolerance, Salinity, Osmotic pressure, Irrigation effects, Soil-water-plant relationships, Plant physiology, Leaves, Stemflow, Inhibitors, Environmental effects, Drought resistance, Water balance, Circulation (Plants).
Identifiers: *Cytokinins, *Protein synthesis, Mannitol, Carbowax 6000, Kinetin equivalents, Israel.

The growth reduction effects on plants, of salinity and drought have never been adequately explained although many theories have been proposed. Previous work indicated that cytokinins are produced in the roots, possibly regulate shoot growth, and are inhibited by water stress. Five week-old seedlings were subjected to stress by adding NaCl, Carbowax 6000, or mannitol to their nutrient solutions in 2 equal portions over 48 hours. The full stress was terminated after 24 hours. Root exudates were then assayed for cytokinin activity, and the active extract showed proportional decreases in callus growth with increasing dilution. The cytokinin activity in the extract also decreased linearly with increasing NaCl in the nutrient solution. Similar variations with Carbowax 6000 or mannitol indicated this was not an osmotic or specific ionic effect. Increase of NaCl also decreased L-leucine carbon 14 incorporation into leaf discs indicating salt-induced decrease in leaf protein synthesis resulted from cytokinin deficiency. Cytokinin levels rose after termination of stress. The thesis that cytokinin signals root stresses to the shoot causing decreased plant growth even at very low stress levels was considered probable. THE ASSESSMENT OF SOIL WATER STATUS AS IT AFFECTS PLANT WATER USE,
National Vegetable Research Station, Wellesbourne (England).
E. J. Winter.
Measurement of Environmental Factors in Terrestrial Ecology, Blackwell Scientific Publications, p 147-159, 1968. 33 ref.

Descriptors: *Soil-water-plant relationships, *Lysimeters, *Soil moisture, *Field capacity, *Moisture availability, Wilting point, Excess water (Soils), Microenvironment, Soil water movement, Water utilization, Tensiometers, Earth-water interfaces, Evaporation, Root systems.
Identifiers: *Exploitable water, *Matric suction, *Moisture release curve, Neutron probe, Resistance blocks.

Total soil moisture content and factors which influence water uptake by roots determine the soil water effects on plant communities. The total soil water is easily determined but measuring the amount available to plants is difficult. The available water is defined as the field capacity minus the permanent wilting percentage. As soil water decreases through evaporation and transpiration, matric suction increases and may be measured by a tensiometer. Exploitable water is available water that can be taken up by plants under specific conditions. The efficiency of its removal depends upon root characteristics and rate of soil water movement toward the roots. The moisture release curve of a given soil must be known so that the amount of soil available water after a given application may be determined. The available water capacity of a soil is a function of the soil texture. Soil water removal by plants may be measured directly by lysimeters or by indirect methods. Various in-situ instruments may be used to measure the evaporative potential of soil sites. An appendix outlines the various methods and instruments for assessing the effect of soil water status on plants. (Casey-Arizona)

HYDROLOGICAL IMPLICATIONS OF GRASS ROOTS STUDIES AT A SITE IN EAST AFRICA,
East African Agriculture and Forestry Research Organization, Nairobi (Kenya). Physics Div.
M. Dagg.
Journal of Hydrology, Vol 9, No 4, p 438-444, December 1969. 7 p, 1 fig, 1 tab, 6 ref.

Descriptors: *Soil moisture, *Grasses, *Transpiration, *Moisture deficit, Moisture stress, Water loss, Wilting point, Specific retention, Moisture content, Soil water movement, Soil-water-plant relationships, Climatology, Consumptive use, Dehydration.
Identifiers: *Kenya, Soil moisture resistance.

Soil moisture resistance unit studies show that several perennial grasses root rapidly to depths of 6.1 m under the environmental conditions at Muguga, Kenya, alt. 2070 m, and maintain near potential rates of transpiration until the whole soil profile is near wilting point. With an average annual potential transpiration from grass of 1275 mm, appreciably in excess of the average annual rainfall of 1013 mm, it is concluded that large soil moisture deficits are likely at the start of each rainy season and that through drainage to the groundwater table requires an uncommonly high concentration of about 660 mm of rain within two months. Meteorological and soil conditions over large parts of East Africa would suggest that equally informative results could be obtained elsewhere from simple resistance units, and it has been recommended that routine observation of a few profiles of resistance units over the root range of typical perennial vegetation be added to the normal schedule at agrometeorological stations in East Africa. TESTING SEDIMENT MOVEMENT DUE TO WAVE ACTION,
Western Australia Univ., Nedlands. Dept. of Civil Engineering.
Geoffrey R. Mogridge.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY7, Paper 7433, p 1587-1604, July 1970. 18 p, 9 fig, 2 tab, 21 ref, append.

Descriptors: *Sediment transport, *Bottom sediments, *Waves (Water), *Hydraulic models, *Wave pile-up, Ocean waves, Critical flow, Sediment load, Bed load, Mass transfer, Supercritical flow, Beaches, Beach erosion, Currents (Water).
Identifiers: Wave tanks.

The development of laboratory equipment to simulate the water particle motion at the sea bed due to wave action is described. Essentially it oscillates a block of water horizontally in a flume. An inverted U-frame constraining the water measures 84 in. long by 48 in. wide by 24 in. high and is large enough to reproduce prototype boundary conditions. A piston drive is supplied by high pressure oil and motion is controlled to follow a sinusoidal input movement. Previous attempts to model wave action for the study of sediment movement are analyzed and the benefits of the present design are outlined. It is proposed that the equipment be used to study the effects of superimposed wave trains and mass transport velocity on sediment movement. (Knapp-USGS)

RADIOCARBON CHRONOLOGY OF RED SEA SEDIMENTS,
Woods Hole Oceanographic Institution, Mass.; and Lamont Geological Observatory, Palisades, N.Y.
David L. Thurber, and Guy G. Mathieu.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 348-359, 1969, 12 p, 5 fig, 2 tab, 28 ref. NSF Grants GA-584 and GA-1346.

Descriptors: *Bottom sediments, *Sea water, *Brines, *Paleoclimatology, *Radioactive dating, *Water chemistry, Geothermal studies, Hot springs, Mineralogy, Paleohydrology, Stable isotopes, Sounding, Sampling, Carbon radioisotopes, Chemical precipitation, Geology.
Identifiers: *Red Sea, Hot brines, Paleontology.

Radiocarbon dates have been obtained on seven cores taken from the central part of the Red Sea in the axial trough. The observed sedimentation rates (over the past 20,000 years) range from about 5cm/1,000 yr to more than 60cm/1,000 yr. Variations are primarily due to the episodic precipitation of minerals associated with the geothermal activity of the hot-brine deeps. The brine-derived materials precipitate at a rate of more than 40cm/1,000 yr, whereas accumulation rates of the detrital silicates and calcareous shells are on the order of 2cm/1,000 yr and 8cm/1,000 yr respectively, for the area studied. The abrupt world climatic changes at 11,000 years ago which mark the close of the Wisconsin glacial period seen in these cores. Before the warming of world-wide climate at about 11,000 years B. P., the Red Sea environmental condition must have been one of high salinity and regression of the sea. The sill located near the Strait of Bab el Mandeb must have been effective in limiting the water exchanges between the Red Sea and the Indian Ocean during the low sea stand of the Wisconsin. Intrusions of hot brine into the Atlantis II Deep may have occurred over the last 10,000 years. (See also W70-07394) (Knapp-USGS)

MICROSCOPIC AND ELECTRON BEAM MICROPROBE STUDY OF SULFIDE MINERALS IN RED SEA MUD SAMPLES,
Kennecott Copper Corp., Salt Lake City, Utah.
J. D. Stephens, and R. W. Wittkopp.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 441-447, 1969. 7 p, 6 fig, 1 tab, 5 ref.

Descriptors: *Bottom sediments, *Mineralogy, *Sulfides, *Mud, Copper, Iron, Electron microscopy, Hot springs, Analytical techniques, Sampling, Sea water, Water chemistry, Chemical analysis, Brines.
Identifiers: Red Sea, Hot brines, Electron beam microprobe.

Base metal distribution in ten Red Sea mud samples recovered by Woods Hole Oceanographic Institution personnel was studied by microscopic and electron beam microprobe techniques. Most of the base metals in the samples were present as sulfides. The most common sulfide mineral was marcasite, but chalcopyrite and marmatite were also identified in many of the samples. Marcasite occurred as euhedral plate or lath-shaped crystals, frequently perched along the center line of euhedral anhydrite crystals. Chalcopyrite and marmatite occurred as irregular or subhedral particles. In several cases, marmatite rims completely surrounded chalcopyrite particles of chalcopyrite rims surrounded marmatite particles. Mascasite was observed filling the interiors of microfossils in several instances. Static electron beam analysis of the marmatite showed that it contained large amounts of iron. Some of the marmatite also contained substantial amounts of copper and traces of cadmium. Copper and zinc values also occurred as a submicron dispersion in the mud matrix. MINERALOGY AND MICROPALEONTOLOGY OF A GOETHITE-BEARING RED SEA CORE,
Washington State Univ., Pullman. Dept. of Geology.
Yvonne Hermann, and P. E. Rosenberg.
Work supported by grants from Office of Naval Research and National Science Foundation. Report available for inspection in USGS-WRD Library, Wash, D C. In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 448-459, 1969. 12 p, 4 fig, 4 tab, 16 ref. ONR Grant Nonr 266 (48).

Descriptors: *Bottom sediments, *Hot springs, *Mineralogy, *Iron compounds, *Spectroscopy, Mud, Analytical techniques, Radioactive dating, Carbon radioisotopes, Sampling, Cores, Sea water, Water chemistry, Chemical analysis, Brines.
Identifiers: Hot brines, Red Sea, Spectrochemical analysis.

The mineralogy and micropaleontology of a goethite-bearing core from the northern Red Sea have been studied. Variations in planktonic microfaunal composition with depth in the core reveal three major climatic phases: Phase I, Postglacial, encompassing the last 11-12,000 years; Phase II, Llate glacial stades which began about 60-65,000 years ago; and Phase III, an interstadial, with a fauna similar to that of Phase I, commencing about 1000,000 years ago. The core is composed of sediments containing scattered, lithified, calcareous fragments and lumps, 3 mm to 2 cm in diameter. Goethite is present in sediment samples at all depths and forms an almost monomineralic bed, deposited near the beginning of Phase III. Spectrochemical analyses of the goethite bed indicate a concentration of several heavy metals in excess of the average reported for marine sediments. The goethite is attributed to hot brine activity. Cross-correlations with C-14 dated Red Sea cores and extrapolations assuming constant rates of sedimentation, suggest that the history of hot brine deposition in the northern Red Sea extends back at least 100,000 years B. P. (See also W70-07394) (Knapp-USGS)

MAGNETIC PROPERTIES OF MINERALS FROM THE RED SEA THERMAL BRINES,
Massachusetts Inst. of Tech., Cambridge; and Woods Hole Oceanographic Institution, Mass.
D. W. Strangway, B. E. McMahon, and J. L. Bischoff.

In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 460-473, 1969. 14 p, 12 fig, 2 tab, 29 ref. NSF Project G. P. 5341.

Descriptors: *Bottom sediments, *Mineralogy, *Hot springs, *Magnetic studies, *Iron compounds, Iron oxides, Geochemistry, Geophysics, Sulfides, Analytical techniques, Sampling, Sea water, Water chemistry, Chemical analysis, Brines.
Identifiers: Red Sea, Hot brines, Magnetic minerals.

Studies of the magnetic properties of sediment samples recovered from the thermal brine area of the Red Sea were made. The minerals which have distinctive magnetic signatures, particularly on heating, are goethite, lepidocrocite, siderite, manganosiderite, pyrite, hematite and small quantities of a ferrimagnetic mineral, which is probably maghemite. Hematite is present in two of the cores recovered from the Atlantis II Deep. The magnetic properties indicate that this material is coarse-grained. By contrast the hematite formed chemically during heating experiments is fine-grained. A ferrimagnetic mineral, probably maghemite, is present in many of the samples examined. Most of this material is destroyed by heating above 500 deg C. The absence of an observable Neel temperature effect in the goethites at 120 deg C is attributed to the small grain sizes, making much of the material superparamagnetic at room temperature. Other data indicate that much of the goethite is in particles less than 100 angstroms. (See also W70-07394) (Knapp-USGS

In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 474-498, 1969. 25 p, 7 fig, 12 tab, 52 ref. ACS-PRF Number 2815-A2.

Descriptors: *Bottom sediments, *Sea water, *Hot springs, *Stable isotopes, *Sulfur, Analytical techniques, Sampling, Tracers, Water chemistry, Evaporation, Brines.
Identifiers: *Red Sea, Hot brines, Sulfur isotopes, Isotope analysis.

Sulfur isotope ratio meansurements and trace element analyses were performed on sediment from selected cores from the Red Sea geothermal deposit, the overlying brine and interstitial water. The data show that delta S-34 falls into four general ranges: (1) over 25 per mill, (2) +23 to +15 per mill, (3) +12 to +2 per mill, (4) less than -25 per mill. Sulfate in the brine appears to have been derived from marine evaporites, whereas sulfide originates from two sources. In the Atlantis II Deep, it is derived from a hydrothermal process and introduced with the brine. In the other areas, biological sulfate reduction produces sulfide which precipitates metals from the brine originating in the Atlantis II Deep. (See also W70-07394) (Knapp-USGS)

LEAD ISOTOPES MEASUREMENTS ON SEDIMENTS FROM ATLANTIS II AND DISCOVERY DEEP AREAS,
Australian National Univ., Canberra.
J. A. Cooper, and J. R. Richards.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Spring-Verlag New York Inc, p 499-511, 1969. 13 p, 5 fig, 2 tab, 37 ref.

Descriptors: *Bottom sediments, *Lead radioisotopes, *Stable isotopes, Mineralogy, *Hot springs, Brines, Analytical techniques, Sampling, Sea water, Water chemistry, Chemical analysis, Trace elements.
Identifiers: *Red Sea, Hot brines, Lead isotopes.

In a study of the recent mineralized sediments from the Central Red Sea, a clear difference in the lead isotope pattern is observed in core sections of up to 5m in depth betweeen those from Atlantis II Deep on the one hand and the Discovery Deep and barren sediments on the other. In general, low heavy-metal concentrations correlate with a low overall content of lead with variable isotopic ratios, a pattern observed in other areas of marine sedimentation. The more mineralized samples of Atlantis II Deep, with greater quantities (up to 500ppm) of lead, point to an ore source material with only small isotopic variation. The Discovery Deep samples, although mineralized, exhibit isotopic variation in the lead, suggesting significant contamination, in conformity with ideas that this 'pool' is an overflow from the Atlantis II Deep. Possible sources of the mineralization are considered. It is suggested that the mode of mineralization represented by this deposit is one very possible mechanism for the formation of 'Pyritic Conformable' or 'Straitiform' ore bodies. W70-07703

URANIUM SERIES ISOTPES IN SEDIMENTS FROM THE RED SEA HOT-BRINE AREA,
Woods Hole Oceanographic Institution, Mass.
Teh-Lun Ku.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Spring-Verlag New York Inc, p 512-524, 1969. 13 p, 4 fig, 6 tab, 23 ref. NSF Grant GA-584.

Descriptors: *Uranium radioisotopes, *Bottom sediments, *Brines, *Hot springs, *Radioactive dating, Sea water, Radiochemical analysis, Water chemistry, Chemical analysis, Trace elements, Analytical techniques.
Identifiers: *Red Sea, Hot brines, Thorium isotopes.

The distribution of the longer-lived uranium and thorium series isotopes in the iron-rich sediments of the Red Sea geothermal brine area is characteristics. Concentrations of uranium on a salt- and water-free basis range from 6 to 30 ppm, wheras those of thorium range from 0.1 to 0.5 ppm. The low Th/U ratios are also reflected by the low activity ratios of Th-230/U-234 and Pa-231/U-235, considerably less than the secular equilibrium value of unity. Maximum ages of the deposits may be estimated. The metalliferous sediments accumulated at a rate of at least 40 cm/1000 yr and that the sampled four to eight meters of sediment columns in the Atlantis II Deep were deposited in less than 10,000 years. An important fraction of uranium may have been scavenged out of the overlying normal Red Sea water through co-precipitation with the colloidal ferric hydroxide and silica. (See also W70-07394) (Knapp-USGS)
W70-07704

COMPARISON BETWEEN RED SEA DEPOSITS AND OLDER IRONSTONE AND IRON-FORMATION,
Geological Survey, Washington, D.C.
Harold L. James.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Spring-Verlag New York Inc, p 525-532, 1969. 8 p, 1 fig, 2 tab, 21 ref.

Descriptors: *Bottom sediments, *Mineralogy, *Geochemistry, *Hot springs, *Brines, Water chemistry, Iron compounds, Trace elements, Sea water, Carbonate rocks, Geology, Sediments, Diagenesis, Leaching.
Identifiers: *Red Sea, Hot brines, Ironstone, Iron formations.

Physically the Red Sea sediment is utterly unlike either ironstone or iron-formation, but chemically it has affinities to both except for its remarkable content of base and precious metals. If the Red Sea sediment were being deposited in an environment of strong current and wave action, the resulting product probably would be an ironstone of reasonably orthodox character. If it were to be buried in its present form, a remote possibility exists that it could become chemically differentiated through dewatering and diagenetic processes to yield an end product comparable to iron-formation, but more likely a substantial part of the iron and much or all of the base metals would migrate in hot brine solutions to be reprecipitated in laterally continuous carbonate host rocks. (See also W70-07394) (Knapp-USGS)
W70-07705

ECONOMIC POTENTIAL OF THE RED SEA HEAVY METAL DEPOSITS,
Woods Hole Oceanographic Institution, Mass.; and Geological Survey, Woods Hole, Mass.
J. L. Bischoff, and F. T. Manheim.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Spring-Verlag New York Inc, p 535-541, 1969. 7 p, 2 fig, 3 tab, 12 ref. NSF Grant GA-584.

Descriptors: *Bottom sediments, *Mining, *Economics, *Mineralogy, Hot springs, Brines, Geochemistry, Water chemistry, Costs, Iron compounds, Trace elements, Sea water, Geology, Sediments.
Identifiers: Mining costs, Red Sea, Hot brines.

Average assays of metals in Atlantis II Deep deposits are: Fe, 29 per cent; Zn, 3.4 per cent; Cu, 1.3 per cent; Pb, 0.1 per cent; Ag, 54 ppm; Au, (probably) 0.5 ppm. The deposits contained from 55 to 96 per cent interstitial brine, averaging about 85 per cent. Total brine-free sediment in the upper 10 m of sediment is estimated to be over 50 million tons. At current smelter prices for Zn, Cu, Pb, Ag and Au these metals would be worth about 2.5 billion dollars. Deposits in the adjacent Discovery Deep contain lower, but still abnormal, metal concentrations. Metal-bearing deposits probably extend to a depth of about 20 m below the sediment surface, but the metal grade of sediments below 10 m is unknown. Size and grade of the deposits appear to make the deposits attractive for explitation. (See also W70-07394) (Knapp-USGS)
W70-07706

INTERFERENCE RIPPLE MARKS FORMED BY EPHEMERAL STREAMS,
Utah Univ., Salt Lake City. Dept of Geological and Geophysical Sciences; and Oberlin Coll., Ohio. Dept. of Geology.
M. Dane Picard, and Lee R. High, Jr.
Journal of Sedimentary Petrology, Vol 40, No 2, p 708-711, June 1970. 4 p, 4 fig, 1 tab, 13 ref. NSF Grant (GA-12570).

Descriptors: *Ripple marks, *Sedimentary structures, *Ephemeral streams, *Alluvial channels, Sand waves, Dunes, Regime, Currents (Water), Turbulence, Turbulent flow, Waves (Water).
Identifiers: Interference ripple marks.

Interference ripple marks form during floods along many ephemeral streams. Cuspate (linguoid) ripples form first when flood water in the channel is deep enough to flow over marginal and channel sand bars. As the water level falls, downstream currents are refracted shoreward over the marginal sand bars and linear ripple sets are formed on the tops and flanks of the bars. The linear ripples are oriented at right angles to the cuspate ripples and commonly form interference sets with them. Refracted waves and changing water level over the irregular bottom can complicate further the patterns of asymmetric ripple marks and other directional structures. Paleocurrent patterns of fluvial deposits are probably more complex than has been generally recognized. The distribution of directional structures in modern streams is, in general, unimodal and the dominant inclinations of foreset laminae are downstream. (Knapp-USGS)

ANNUAL SUSPENDED SEDIMENT SUPPLIED TO THE CALIFORNIA CONTINENTAL BOR-

DERLAND BY THE SOUTHERN CALIFORNIA WATERSHED,
Illinois Univ., Chicago.
Kelvin S. Rodolfo.
Journal of Sedimentary Petrology, Vol 40, No 2, p 666-671, June 1970. 6 p, 3 fig, 12 ref.

Descriptors: *Suspended load, *Sediment load, *Rivers, *California, Sediment yield, Sediment transport, Particle size, Mineralogy, Sampling, Analytical techniques.
Identifiers: Southern California.

Southern California streams were sampled at their mouths during a rainy season to determine the concentrations, grain sizes, mineralogy and quantities of suspended sediment supplied to the ocean by the southern California watershed. Approximately 3.5 million tons of suspended sediment are brought to the ocean annually by southern California streams. About 0.8 million tons are arkosic sands, and the remaining 2.7 million tons of river-supplied sediment are silts, clays, colloids and dissolved material. Approximately 4.2 million tons of sand can be attributed to stream traction load. Southern California supplies 7.7 million tons of terrigenous material to the Continental Borderland every year. This estimate agrees well with rates of supply which have been calculated from seismic profiling surveys. (Knapp-USGS)
W70-07893

THE INFLUENCE OF AREAL TRENDS ON CORRELATIONS BETWEEN SEDIMENTARY PROPERTIES,
Northwestern Univ., Evanston. Ill.; and Esso Production Research Co., Houston, Tex.
W. C. Krumbein, and Thomas A. Jones.
Journal of Sedimentary Petrology, Vol 40, No 2, p 656-665, June 1970. 10 p, 6 fig, 6 tab, 5 ref.

Descriptors: *Statistical methods, *Correlation analysis, *Sedimentology, Sedimentary structures, Statistics, Mineralogy, Particle size, Provenance, Simulation analysis, Statistical models.
Identifiers: Trend surface analysis.

The search for relations among sedimentary properties is a basic procedure in the interpretation and reconstruction of sedimentary environments. These relations are commonly expressed as the correlation coefficient, r, between pairs of variates plotted on scatter diagrams. The observed correlations are closely related to trends or systematic patterns of areal variation in the data. The coefficients of trend surfaces can be used to predict the correlation between two mapped variables, and by expressing the correlation in terms of its covariance and variances, the observed relations can be partitioned into systematic and residual portions. A shift of emphasis for consideration of correlation coefficients (which are not additive) to covariance sums of crossproducts (which are) affords additional opportunities for analyzing the contributions of two or more sources of covariation. In this approach trend surface analysis plays an important role in partitioning the crossproduct sum. A statistical model is presented for this purpose, and some sources of covariation in beach foreshore properties are examined in part by simulation studies of areal patterns of variation and the population densities of mapped variables. MINERALOGY AND DISTRIBUTION OF CLAY SIZE SEDIMENT IN GLACIER BAY, ALASKA,
State Univ. Coll., Potsdam. Dept. of Geology; and Alaska Univ., College. Inst. of Marine Science.
Neal R. O'Brien, and D. C. Burrell.
Journal of Sedimentary Petrology, Vol 40, No 2, p 650-655, June 1970. 6 p, 4 fig, 10 ref. AEC Contract AT- (04-3)-310.

Descriptors: *Clays, *Mineralogy, *Sediments, *Fjords, *Alaska, Glaciers, Glacial drift, Bottom sediments, X-ray analysis, X-ray diffraction, Weathering, Provenance.
Identifiers: Glacier Bay (Alaska).

The mineralogy of clay size bottom sediment was studied in the main channel and adjacent fjords in Glacier Bay, Alaska to determine if a lateral change in clay composition occurs as sediment is carried from a fresh water to marine environment. X-ray analysis indicates a dominance of chlorite and trioctahedral mica which does not change in composition or abundance laterally. The lack of diagenetic formation of new minerals probably is due to the rapid rate of clay sedimentation and also due to the minor amount of chemical degradation at the source in this subarctic environment. (Knapp-USGS)

GRAIN SIZE PARAMETERS FOR SANDY-GRAVELS,
Southampton Univ., (England). Dept. of Oceanography.
K. R. Dyer.
Journal of Sedimentary Petrology, Vol 40, No 2, p 616-620, June 1970. 5 p, 5 fig, 1 tab, 12 ref.

Descriptors: *Classification, *Particle size, *Gravels, *Sands, Statistical methods, Sediments, Sampling.
Identifiers: Sandy gravels.

A series of parameters are proposed to describe the grain size frequency distribution of sandy-gravels. They are shown to be selective in distingusihing variations in the proportions of the two modes, especially at 25% sand, an important point in the packing of bimodal materials. A number of samples from the Solent, a channel between Hampshire, England, and the Isle of Wight, are considered as examples of the sedimentary significance of the use of the parameters in a tidal enviornment. (Knapp-USGS)

VELOCITIES OF CULVERT JETS FOR INCIPIENT EROSION,
Geological Survey, Mineola, N.Y.; and Cincinnati Univ., Ohio. Dept. of Civil Engineering.
Gerald E. Seaburn, and Louis M. Laushey.
French summary included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C1, p 1-8, 1967. 8 p, 4 fig.

Descriptors: *Scour, *Culverts, *Jets, *Engineering structures, *Erosion, Streambeds, Stilling basins, Stones, Pipe flow, Momentum equation, Shear drag, Tailwater.
Identifiers: *Velocities of culvert jets, Streambed erosion.

High capacity culverts too often cause streambed erosion at the outlet. The construction of stilling basins designed to reduce erosion is too expensive and is seldom justified for small culverts. Theoretical and experimental studies were undertaken using loose stones to prevent erosion at the outlet of small culverts. The critical velocity that will initiate erosion was found by trials under full-pipe and partially-full pipe flows. In the full-pipe flow, the critical momentum was proportional to the cube of the stone size. Further, a larger velocity was required to scour the spheres than the stones, because the spheres have a smaller drag coefficient and a better hydrodynamic shape. The pipe diameter is not a useful parameter in partially-full pipe flow. The critical velocity of the outlet of culverts required to initiate the scouring of a noncohesive bed is (1) dependent on the size of stones and the diameter of the culvert if the culvert flows full; and (2) dependent on the stone size but independent of the diameter of the culvert if this flows only partly full. The tailwater provided no protection against bed erosion when the depth of pipe was less than one-half of the pipe diameter. (Carstea-USGS)

MEAN-VELOCITY CRITERION FOR SCOUR OF COARSE UNIFORM BED-MATERIAL,
Research Council of Alberta, Edmonton.
C. R. Neill.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C6, p 46-54, 1967. 9 p, 4 fig, 1 tab, 11 ref.

Descriptors: *Scour, *Streambeds, *Sediment transport, *Bed load, Flumes, Particle size, Flow, Shear stress, Channels, Erosion, Alluvial channels.
Identifiers: Stones.

Flume experiments were conducted using 6 to 30 mm grain-size particles for uniform bed materials to study the initial motion of particles. A nomogram was derived which gives the 'competent mean velocity' for coarse materials in terms of grain size, grain density, and depth of flow. The conditions under which single stones in a uniform bed will be first displaced under gradually increasing strength of flow are given. The first displacement of particles are correlated with mean velocity rather than shear stress. The mean-velocity data for uniform coarse material in wide channels compared well with data of other investigators who used materials up to 140 mm. A direct comparison with Shield's data is not possible. (Carstea-USGS)

ON THE MECHANISM OF THE LOCAL SCOUR FROM FLOWS DOWNSTREAM OF AN OUTLET,
Kyoto Univ. (Japan). Disasters Prevention Research Inst.
Yoshito Tsuchiya, and Yuichi Iwagaki.
Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C7, p 55-64, 1967. 10 p, 8 fig, 6 ref.

Descriptors: *Scour, *Outlets, *Hydraulic structures, *Sediment transport, Downstream, Jets, Tractive forces, Particle size, Mathematical models, Saltation, Specific gravity, Shear, Velocity, Model studies, Alluvial channels, Stream erosion.

Identifiers: *Scour development, Scour mechanisms.

Local scour downstream of hydraulic structures is a very complicated phenomenon because the sediment is transported under nonequilibrium conditions. Basic experiments were conducted on the local scour downstream of an outlet using theories of wall jets and of critical tractive force. Both the initial and progressive stages of development of local scour were studied. A simple mathematical model describes nonequilibrium transport. Saltation length, shear velocity, sedimentation rates, critical shear velocity, distance, specific gravity of grains, and grain size need to be known in order to calculate the rate of sediment transport. In the initial stage of development, the theoretical configuration of the scour hole, rate of sediment transport, and change in maximum depth of scour are in good agreement with the experimental values. In the progressive stage of scour development, the maximum rate of sediment transport occurs at the end of the scour hole. The scour process becomes stable when the sediment in the scour hole cannot move along the hole because of the decrease in the shear velocity, and the rate of sediment transport by the wall jet becomes equivalent to the recurrent rate due to the roller. NOTE ON THE METHODS OF STUDY OF THE LOCAL SCOUR OF BED ROCKS ON A REDUCED MODEL,
P. Wisner, M. Radu, and G. Armencea.
English summary included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C9, p 74-82, 1967. 9 p, 8 fig, 10 ref.

Descriptors: *Scour, *Alluvial channels, *Streambeds, *Model studies, *Energy dissipation, Dams, Spillways, Velocity, Arch dams, Cohesive soils, Cohesionless soils, Sands, Sediment transport, Stream erosion.
Identifiers: *Scour below dams.

Experiments were conducted to study the intensity of local scour below dams as a function of bed material and water velocity. Two kinds of experiments are of particular interest because of their natural occurrences: (1) A spillway with an energy dissipator, and (2) spillway with an arch-dam that throws a free nappe on an unprotected bed. Using an energy dissipator, the scour depth for a bed of cohesive material was much deeper than for noncohesive material. With no energy dissipator, the form of the scour hole in a bed of concrete blocks was localized and shallower than in a sand bed. (Carstea-USGS)

THE GEOMETRICAL DEVELOPMENT AND DEVELOPMENT IN TIME OF SCOUR BENEATH A THIN SLAB,
Hydraulic Research Inst., Prague (Czechoslovakia).
Zdenek Thomas.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C10, p 83-91, 1967. 9 p, 4 fig, 3 ref.

Descriptors: *Scour, *Hydraulic structures, *Sediment transport, Hydraulic models, Model studies, Flumes, Tunnels, Sands, Streambeds, Streams, Flow around objects, Bed load, Stress, Stream erosion, Sedimentation.
Identifiers: *Scour geometry, Scour development, Wind tunnel studies.

Flume experiments were carried out using an aerodynamic tunnel to study the geometry and development of scour. The scour of the sandy bottom was accomplished by air currents around a metal sheet. The distance of the lower edge of the slab to the streambed was varied and the scour was measured for various angles of the slab in relation to the horizontal line. The maximum depth of scour was dependent upon its maximum length. The rate of scour formation is not dependent on the distance of the lower edge of the slab from the sand surface but it is dependent upon the angle of inclination of the slab. Empirical equations were derived for the main geometrical characteristics of scour process as a funtion of inclination angles. Empirical formulas relate the scour depth to the resistance coefficient of bottom and to the tangential stress which corresponds to the beginning of bed load movement. There is good agreement between theoretical conclusions and practical results. (Carstea-USGS)

Descriptors: *Scour, *Dikes, *Sediment transport, Model studies, Hydraulic models, Channels, Streambeds, Shear stress, Sands, Hydraulic structures, Discharge (Water), Streams, Velocity, Flow profiles.
Identifiers: Movable stream bed, Fixed streambed.

To study the scour process, a movable bed was replaced by a fixed bed and the scouring phenomenon was calculated from the shear and normal forces. The first set of experiments was designed to study the beginning of scouring process. The velocity profiles were determined at every cross-section of the channel centerline, and the shear stress was evaluated. Flow patterns around spur-dikes on movable beds are similar to those on fixed bed channels. There is a direct relationship between the maximum shear stress at the channel centerline and the shear stress where the scouring is expected to occur. The seepage force upon sand grains around spur-dikes is negligible for the distance the spur-dike extends into the impermeable layer. A second set of experiments was intended to study the maximum scour depth using two experimental designs: (1) Two spur-dikes were placed symmetrically, one on each side of a movable bed channel, and (2) A spur-dike was placed on one side of the channel. The data were helpful in proposing formulas on the scour around the spur-dikes. (Carstea-USGS)

MECHANISM AND COMPUTATION OF LOCAL AND GENERAL SCOUR IN NONCOHESIVE, COHESIVE SOILS AND ROCK BEDS,
Ts. E. Mirtskhulava, I. V. Dolidze, and A. V. Magomedova.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C20, p 169-176, 1967. 8 p, 1 tab, 9 ref.

Descriptors: *Scour, *Cohesive soils, *Cohesionless soils, *Streambeds, Erosion control, Flow, Turbulent flow, Forecasting, Mathematical studies, Design criteria, Sediments, Sediment transport.
Identifiers: *Local scour, *General scour, Scour depth.

Based on the structure design principles and on the spreading stream theory a relation is given for prognosis of the deepest local scour of noncohesive, cohesive and rock beds. Theoretical, laboratory, and field investigations were used to provide a solution for general and local scour problems. The analogy between the destruction of cohesive soils due to 'fatigue' and that due to trubulent flow was also considered. The problems studied were: (1) The intensity of scour in relation to flow and soil properties; (2) prediction of time required for a given soil to scour; and (3) prediction of scour stabilization. The theory of probability was used to predict erosion in heterogeneous, noncohesive soils. There was good agreement between the experimental and field data. (Carstea-USGS)

French summary included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C21, p 177-184, 1967. 8 p, 4 fig, 1 ref.

Descriptors: *Seepage, *Sheet erosion, *Soil erosion, *Cohesionless soils, Particle size, Water level fluctuations, Water levels, Water storage, Groundwater, Slope stability, Watershed management, Model studies, Equations, Hydraulic gradient, Groundwater movement.

Identifiers: *Groundwater erosion.

Repeated level fluctuations in water storages may by means of groundwater erosion cause considerable damage on unprotected slopes in fine frictional soils. The stable slope section is then rather gentle with safe strength against extensive and even local sliding. On that account the stability concept derives from the entrainment of individual grains at the seepage surface. In this connection the potential field close to the lower terminus of the seepage surface is discussed theoretically, and asymptotic solutions satisfying nonlinear boundary condition are presented. As a practical result it follows that a classical linear condition is reasonable, as the range of nonlinearity is small relative to the grain size. The results of tests carried out for various frictional soils and slope inclinations show that the concept of a critical seepage surface extension offers a simply measurable property. This concept was even applicable to slope section development at repeated level fluctuations considered in long-term tests. (Carstea-USGS)

Neil L. Coleman.
French summary included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C22, p 185-192, 1967. 8 p, 4 fig, 4 ref.

Descriptors: *Sediment transport, *Bed load, *Shear drag, *Particle shape, Tractive forces, Sediments, Flow, Laminar flow, Bottom sediments, Streambeds, Reynolds number, Settling velocity.
Identifiers: Drag forces, Lift forces.

A critical force equation is derived for the case of a sphere resting on a bed composed of similar spheres. The analysis includes quantitative consideration of the effects of both interparticle geometry and the action of a supposed lift force. Experiments based on the analysis are described. The drag coefficient-Reynolds number function for the sphere at rest on a bed is shown to be essentially the same as for a sphere in free fall over a range of Reynolds numbers from about 50 to 9400. A lift factor appearing in the critical force equation is shown to be dependent on the particle Reynolds number, and evidence is presented which indicates that the algebraic sign of this lift factor may depend on the presence or absence of a laminar sublayer in the flow in the vicinity of the sphere. Extension of the analytic and experimental results to the case of inception of motion of real sediment particles is briefly discussed. (Carstea-USGS)

Identifiers: Mobile bed, Fixed bed.

Scour which is caused by vortices in noncohesive bed material is generally more serious than the local scour associated with two-dimensional flow. For practical purposes, the development of the scouring process with time is very important considering the economy and the stability of structures. For a correct prediction of the time history for prototype conditions, experiments were conducted to establish relationships between sediment transport and flow characteristics. Tests were made with an obstacle in steady flow. A model with fixed bottom was used in order to find relationships between the characteristics of flow and the vortices. (Carstea-USGS)

THE EFFECT OF ENTRAINED AIR ON THE SCOURING CAPACITY OF WATER JETS,
Societe Grenobloise d'Etude et d'Applications Hydrauliques (France).
Geoffrey Johnson.
Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C26, p 218-226, 1967. 9 p, 4 fig, 6 ref.

Descriptors: *Scour, *Jets, *Air entrainment, Spillways, Tailwater, Diffusion, Nozzles, Gravels, Hydraulics, Turbulent flow, Open channel flow.
Identifiers: *Scouring capacity, Aerated jets.

The scouring capacity of a jet can be significantly changed by air entrainment in the jet. This is particularly important for spillways with wide flow dispersion and subsequent penetration into deep tailwater. Experiments were conducted to study the effect of tailwater upon the scour depth. At shallow tailwater, the scour depth showed a rapid initial increase followed by a very slow increase, over a long period. As the tailwater depth increases beyond that corresponding to maximum scour, the decrease in scour depth becomes regular and appears to correspond with jet diffusion. The compact and dispersed water jets produced similar scours. The air water jet is much more rapidly diffused and the scour ceases at approximately half the tailwater depth required for the solid jet. The significance of the scour depth limit was made by comparing mathematical expressions with practical results. (Carstea-USGS)

TIME SCALE OF TWO-DIMENSIONAL LOCAL SCOUR,
Waterloopkundig Laboratorium, Delft (Netherlands).
H. N. C. Breusers.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C32, p 275-282, 1967. 8 p, 6 fig, 3 ref.

Descriptors: *Scour, *Dimensional analysis, *Sediment transport, Sediments, Time, Model studies, Hydraulic models, Velocity, Streams, Streamflow, Streambeds, Turbulence, Flumes.
Identifiers: *Local scour, Noncohesive sediments, Hydraulic conditions.

The time scale of the scouring process in noncohesive sediments should be estimated from considerations of the sediment transport and the flow pattern in the scouring holes. Model studies showed that the maximum scouring depth varied exponentially with time and the relationship was nearly independent of the flow configuration. The determination of time scale for different conditions was carried out in 3 flumes of different size on a scouring stony streambed. The velocity profile and the turbulence intensity are important factors in the scouring process and this importance was documented experimentally. The use of time scale is justified by the similarity of experimental scouring holes under different conditions. (Carstea-USGS)

COMPUTATIONS ON NON-STEADY BEDLOAD-TRANSPORT BY A PSEUDO-VISCOSITY METHOD,
Waterloopkundig Laboratorium, Delft (Netherlands).
C. B. Vreugdenhil, and M. de Vries.
French summary included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C35, p 303-313, 1967. 11 p, 6 fig.

Descriptors: *Bed load, *Sediment transport, *Viscosity, Channel morphology, Alluvial channels, Banks, Numerical analysis, Hydraulic properties, Erosion, Sedimentation, Model studies, Streams.
Identifiers: *Non-steady bed-load transport, Pseudo-viscosity method, Channel geometry.

The behavior of the bottom level of an alluvial channel with fixed banks is studied with regard to changes in hydraulic conditions. The numerical procedure and the concept of pseudo-viscosity used for computations of non-steady bed-load transport are discussed. Examples of computation by the method of characteristics are given for a simple case of erosion or sedimentation and for a mixed case of erosion and sedimentation. These computations are compared with experimental data from a river model in the Netherlands. There is a reasonable agreement between field measurements and computations. (Carstea-USGS)

Descriptors: *Retaining walls, Alluvial channels, Grading, Dredging, Laterals, Detention reservoirs, Costs, Bank stability.
Identifiers: Direct protection, Indirect protection.

Bank revetments must be designed within a framework covering the grading and determination of rivers. The paper deals with both the actual revetment of banks (called direct protection) and the structures intended to determine curves, alignments and depths (called indirect protection). The problem of free current rivers in the alluvian zone is analyzed. The layout of the channel should interfere as little as possible with free current rivers; this standard is the lowest cost alternative. The choice of the type of revetment depends on numerous factors which can react with each other (sediment concentration, mechanical characteristics of the soil, upward pressures). Five methods for the stabilization of rivers are given: grading of the bed, dredging, canalization, lateral canals, and accumulation reservoirs. Grading is the most practical and the cheapest method. The article is written in English and includes a French summary. (Grossman-Rutgers)

A FOURTH BRINE HOLE IN THE RED SEA,
Atlantic Oceanographic and Meteorological Labs., Miami, Fla. Sea Air Interaction Lab.
Feodor Ostapoff
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 18-21, 1969. 4 p, 3 fig, 2 tab, 8 ref

Descriptors: *Exploration, *Oceanography, *Water chemistry, *Brines, Density stratification, Sounding, Water temperature, Surveys.
Identifiers: *Red Sea, Hot brines.

This paper discusses some of the results of the OCEANOGRAPHER (USC and GSS) crossing of the Red Sea. A possible new hot hole was observed 617km north-northwest of the original hot brine area. Three reflecting layers were observed in the Atlantis II Deep that are apparently related to the different brine layers. (See also W70-07394) (Knapp-USGS)

BATHYMETRY AND CONTINUOUS SEISMIC PROFILES OF THE HOT BRINE REGION OF THE RED SEA,
Woods Hole Oceanographic Institution, Mass., and Alpine Geophysical Associates, Inc., Norwood, N.J.
David A. Ross, Earl E. Hays, and Frank C. Allstrom.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 82-97, 1969. 16 p, 7 fig, 21 ref. NSF Grant GA-584.

Descriptors: *Sounding, *Oceanography, *Brines, Density stratification, Geophysics, Saline water, Mineralogy, Stratigraphy, Seismic studies.
Identifiers: *Red Sea, Hot brines.

A detailed bathymetric and geophysical study has been made of the three known deeps in the hot brine region of the central rift valley of the Red Sea. Continuous seismic profiling produced a distinct reflection from the hot brine-normal sea water contact in the Atlantis II and Discovery Deeps. The deeps are covered with a thin veneer of heavy-metal rich sediments. A major portion of the Atlantis II Deep contains more than 20m of heavy metal deposits. The sediment distribution in the brine area is compatible with a brine source in the Atlantis II Deep and periodic overflows into Chain and Discovery Deeps at some time in the past. A subsurface seismic reflector postulated to be an unconformity of late Miocene or early pliocene age is common to records from the flanks of the deeps. (See also W70-07394) (Knapp-USGS)

THERMAL MEASUREMENTS IN THE RED SEA HOT BRINE POOLS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Geology and Geophysics.
Albert J. Erickson, and Gene Simmons.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 114-121, 1969. 8 p, 5 fig, 2 tab, 20 ref. ONR Contract Nonr 1841 (74).

Descriptors: *Brines, *Saltine water, *Density stratification, *Water temperature, Sampling, Sounding, Oceanography, Hot springs, Geothermal studies, Saline water systems, Bottom sediments, Exploration, Surveys.
Identifiers: *Red Sea, Hot brines.

Fourteen thermal gradient measurements in the sediments beneath the Atlantis II Deep show large temperature variations both with location in the deep and vertically within individual measurements. Maximum sediment temperature observed was 62.3 deg C. Thermal gradients ranging from 3.75 deg C/m (hotter at depth) to --0.87 deg C/m (cooler at depth) were found, with a tendency for gradients in regions of high absolute temperature to be small or slightly negative. The average measured conductive heat flux into the 56 deg C water of 15 to 20 microcal/sq cm sec is inadequate to provide the heat lost to the 44 deg C water above or to warm the 56 deg C water. Of possible heat transfer mechanisms considered, the uniform convection of hot brine through the sediment beneath the Atlantis II Deep appears most likely to be active now, although former periods of hydrothermal discharge are probable. P. G. Brewer, C. D. Densmore, R. Munns, and R. J. Stanley.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 138-147, 1969. 10 p, 6 fig, 9 tab, 12 ref.

Descriptors: *Brines, *Saline water, *Hydrography, *Oceanography, *Water temperature, Mapping, Sounding, Surveys, Water chemistry, Sampling, Geochemistry, Geothermal studies, Saline water systems, Bottom sediments, Mineralogy, Density stratification.
Identifiers: *Red Sea, Hot brines.

The temperature and salinity characteristics of the Red Sea brines and their overlying waters are discussed, and data from the 1966 CHAIN cruise are presented. Most papers on this subject have reported 'salinity' values derived from volumetric dilution of the sample with distilled water and conductometric measurement of the dilute sample. The errors in this procedure are described, and the true salinity of a number of samples has been measured. Layering in the brines is discussed. Some practical difficulties of sampling in the deeps are outlined. (See also W70-07394). (Knapp-USGS)

TEMPERATURE STRUCTURE OF THE RED SEA BRINES,
Woods Hole Oceanographic Institution, Mass.
David A. Ross.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 148-152, 1969. 5 p, 2 fig, 2 tab, 17 ref.

Descriptors: *Brines, *Water temperature, *Sounding, *Sea water, *Density stratification, Thermal stratification, Oceanography, Water chemistry, Geochemistry, Hot springs, Geothermal studies, Saline water systems, Bottom sediments, Surveys.
Identifiers: *Red Sea, Hot Brines.

Temperature measurements obtained by a temperature telemetering pinger show a stratification in the hot brines of the Red Sea. In the Atlantis II Deep a 44 deg C water, which starts at a depth of 2,009m and has a thickness of 28m, overlies the bottom 56 deg C water. The interface between these layers is sharp and only about 5 m thick. In the Discovery Deep a 4m thick 36 deg C water overlies a bottom 44 deg C water. The interface between these layers is not as sharp as that of the Atlantis II Deep. The Chain Deep has water of at least 34 deg C. Layering may be present; however, the deepest part of this hole was not reached. (See also W70-07394). (Knapp-USGS)

SUSPENDED MATTER IN THE RED SEA BRINES AND ITS DETECTION BY LIGHT SCATTERING,
Lamont Geological Observatory; Palisades, N.Y.; and Woods Hole Oceanographic Inst., Mass.
William B. F. Ryan, Edwards M. Thorndike, Maurice Ewing, and David A. Ross.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 153-157, 1969. 5 p, 3 fig, 1 tab, 11 ref. ONR Contract N00014-67-A-0108-0004.

Descriptors: *Water chemistry, *Chemical precipitation, *Mineralogy, *Brines, Oceanography, Sea water, Colloids, Suspended load, Sampling, Instrumentation, Hot springs, Saline water systems, Bottom sediments, Exploration, Density stratification.
Identifiers: *Red Sea, Hot brines.

A dense layer of suspended particulate matter exists below a depth of 1,900m in the Atlantis II Deep in the Red Sea. This layer was detected with a light scattering meter (nephelometer) at two locations within this deep and was found to conform generally to the zone of hot brines. The nepheloid layer scatters light with a constant intensity except for a few very thin internal layers of greater light scattering which correlate with the interface between the different temperature and salinity brines. The intensity of light scattering is found to increase gradually over an interval of eighty meters in the transition zone between the hot brine and the normal Red Sea deep water. The particles which produce the light scattering are interpreted as the colloidal suspensions and mineral precipitates created by the interaction of the reducing, acidic, and metal-containing hot brine with the oxidizing and alkaline overlying normal Red Sea deep water. (See also W70-07394). (Knapp-USGS)
W70-07687

TEMPERATURE MEASUREMENTS IN THE BOTTOM LAYERS OF THE RED SEA BRINES,
Cambridge Univ. (England). Dept. of Geodesy and Geophysics.
David T. Pugh.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc. p 158-163, 1969. 6 p, 3 fig, 14 ref.

Descriptors: *Water temperature, *Density stratification , *Brines, Sea water, Geothermal studies, Oceanography, Saline water, Sounding, Surveys, Hot springs, Bottom sediments.
Identifiers: *Red Sea, Hot brines.

Detailed measurements of temperatures in the water layers immediately above the sediments in Atlantis II and Discovery Deeps are presented. In the bottom 60m of Discovery Deep there is a cooling of 0.5 deg C as the sediment is approached; above 60m the temperature gradient is adiabatic except for a discrete temperature change at 80m. The water column at the bottom is stable. These results suggest periodic outflow of hot saline water from Atlantis II Deep into Discovery Deep. (See also W70-07394). (Knapp-USGS)
W70-07688

A PHYSICAL INTERPRETATION OF THE OBSERVATIONS OF HOT BRINE LAYERS IN THE RED SEA,
Cambridge Univ. (England). Dept. of Applied Mathematics and Theoretical Physics.
J. S. Turner.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc., p 164-173, 1969. 10 p, 1 fig, 3 tab, 21 ref.

Descriptors: *Brines, *Water temperature, *Density stratification, *Hot springs, *Laboratory, Tests, Model studies, Geochemistry, Geothermal studies, Oceanography, Sounding, Exploration, Saline water, Diffusion, Convection, Water chemistry, Sea water, Bottom sediments.
Identifiers: *Red Sea, Hot brines.

The observed temperature structure of the Red Sea brines, which occur as well-mixed layers separated by sharp interfaces, is compared with other natural examples of layering and also with laboratory experiments designed to study the phenomenon. The existence of such layers is characteristic of liquids which are stabilized with salt but are made unstable by heating from below. Various possible mechanisms for their formation and maintenance are evaluated from a physical point of view. The available evidence supports the idea that the source of the brines is in the Atlantis II Deep, which overflowed into the other holes in recent times. (See also W70-07394) (Knapp-USGS)
W70-07689

A NOTE ON THE CHEMICAL COMPOSITION OF THE RED SEA BRINES,
Woods Hole Oceanographic Institution, Mass.
Peter G. Brewer, and Derek W. Spencer.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc., p 174-179, 1969. 6 p, 6 tab, 14 ref. NSF Contract No GA-584.

Descriptors: *Brines, *Water chemistry, *Hot springs, *Sea water, Saline water, Mixing, Density stratification, Manganese, Iron, Salinity, Chemical precipitation, Bottom sediments, Chemical analysis, Water analysis.
Identifiers: *Red Sea, Hot brines.

Samples of brine from the Atlantis II Deep, the Discovery Deep, and the layer of 44 deg C brine overlying the Atlantis II Deep, have been analyzed for the major, and some minor, components. The data are compared with those of other workers and some significant differences are noted. In particular, the Atlantis II brine has been found to have different concentrations of chloride, bromide, sodium and potassium than previously reported. The major ion compositions of the Atlantis II brine and Discovery brine are similar. The chemical composition of the 44 deg C brine in the Atlantis II Deep suggests that it may have formed from the mixing of the highly saline deeper brine and the overlying Red Sea Bottom Water. This brine is rich in manganese but low in iron, owing to precipitation of ferric hydroxide at the 56 deg/44 interface. (See also W70-07394) (Knapp-USGS)
W70-07690

DISSOLVED ARGON, NITROGEN AND TOTAL CARBONATE IN THE RED SEA BRINES,
Scripps Institution of Oceanography, La Jolla, Calif.
R. F. Weiss.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 254-260, 1969. 7 p, 1 fig, 1 tab, 26 ref. NSF Grant GA-666.

Descriptors: *Brines, *Solutes, *Gases, *Sea water, *Geochemistry, Water chemistry, Water analysis, Carbonates, Carbon dioxide, Oxygen, Nitrogen, Stable isotopes.
Identifiers: *Red Sea, Hot brines.

Concentrations of argon, nitrogen, and total carbonate in the Atlantis II and Discovery Red Sea brines were measured by gas chromatography. The isotopic composition of the carbon in the total carbonate of both brines were also measured. Nitrogen and argon are supersaturated by about 250 per cent relative to their solubilities in the brine in equilibrium with the atmosphere. The argon and nitrogen concentrations in the two brines differ by about 10 per cent and 3 per cent, respectively. Large differences were found in total carbonate concentration and in carbon isotopic composition. The possibility that the brines were formed by evaporation, either during some early stage or in coastal lagoons, is discounted by the dissolved gas results. The argon and nitrogen data are consistent with an origin in which the brines were formed from high temperature Red Sea water with the addition of biogenic nitrogen. Water of sufficiently high temperature to be thus considered as a source of the brines can be found only in shallow coastal areas and in the surface and near-surface waters at the southern end of the Red Sea. (See also W70-07394) (Knapp-USGS)
W70-07691

BACTERIAL SULFATE REDUCTION IN THE RED SEA HOT BRINES,
Woods Hole Oceanographic Institution, Mass.
Hans G. Truper.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 263-271, 1969. 9 p, 1 fig, 3 tab, 45 ref. NSF Grants GB-5199, GB-6314 and GA-584.

Descriptors: *Brines, *Sulfates, *Sulfur bacteria, *Sea water, *Hot springs, Sulfur, Water chemistry, Aquatic environment, Dissolved oxygen, Water temperature, Bottom sediments.
Identifiers: *Red Sea, *Hot brines.

Fresh Red Sea brine samples and mud samples from cores were taken under sterile conditions. Enrichment media for sulfate-reducing and nitrate-reducing bacteria were inoculated with these samples and incubated at room temperature and the respective brine temperature. No positive development was found in cultures inoculated from brines or core muds from the brine area. Only one of five cores from outside the brine area contained sulfate-reducing bacteria, of which two strains were isolate. Water samples from the brine/seawater transition zone in the Atlantis II Deep also resulted in positive enrichments, of which three strains of sulfate-reducing bacteria were isolate. No nitrate-reducing bacteria could be enriched from any of the samples. Only sulfate-reducing bacteria from the Atlantis II Deep brine/seawater transition zone grew well at 10 per cent NaC1/44 deg C and 1/2 concentrated brine 35 deg C. (See also W70-07394) (Knapp-USGS)
W70-07692

THE STERILE HOT BRINES OF THE RED SEA,
Woods Hole Oceanographic Institution, Mass.
Stanley W. Watson, and John B. Waterbury.
In: Hot Brines: and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc., p 272-281, 1969. 10 p, 1 fig, 6 tab, 12 ref. NSF Grant GA-584.

Descriptors: *Brines, *Sulfates, *Mineralogy, *Sulfur bacteria, *Sea water, Hot springs, Sulfur, Water chemistry, Aquatic environment, Bottom sediments, Water temperature.
Identifiers: *Red Sea, Hot brines.

The brines of the Atlantis II and Discovery Deeps, their sediments and the water overlying these Red Sea brines were examined for the presence or absence of bacteria. No bacteria were found in the Atlantis II sediments and brines, but they were present in the overlying transition and normal 22 deg waters. The sulfate reducing bacteria in this transition layer may account for the sulfur fractionation found in the metal sulfides in the sediments. In the Discovery Deep, bacteria were present in the sediment but were not demonstrated within the brines. The high temperature, salinity and metal concentrations in the Atlantis II brines are thought to act synergistically, preventing the growth of bacteria. The lower heavy metal concentration in Discovery Deep may make conditions slightly less hostile to life and permit the growth of bacteria in the sediments. (See also W70-07394) (Knapp-USGS)

RED SEA GEOTHERMAL BRINE DEPOSITS: THEIR MINERALOGY CHEMISTRY, AND GENESIS,
Woods Hole Oceanographic Institution, Mass.
James L. Bischoff.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 368-401, 1969. 34 p, 11 fig, 3 tab, 40 ref. NSF Grant GA-584.

Descriptors: *Brines, *Chemical precipitation, *Bottom sediments, *Sea water, *Water chemistry, Mineralogy, Mixing, Hot springs, Saline water, Geochemistry, Geothermal studies, Sampling, Deposition (Sediments).
Identifiers: *Red Sea, *Hot brines.

Chemical and mineralogical analyses were performed on samples from ten specially selected cores from the Red Sea geothermal deposit. The deposit was divided into seven bedded and laterally correlative facies as follows: (1) detrital; (2) iron-montmorillonite; (3) goethite-amorphous; (4) sulfide; (5) manganosiderite; (6) anhydrite; and (7) manganite. Distribution of the facies, their unconsolidated nature, and age relations indicate that the solids were precipitated out of the overlying brine column, that the area of brine discharge is very local within the Atlantis II Deep, and that the chemistry of the brine has changed considerably with time. Mechanisms of precipitation include simple cooling of subterranean brine as it discharges into the bottom of the Atlantis II Deep and mixing of the brine with the overlying sea water. (See also W70-07394) (Knapp-USGS)
W70-07696

GEOTHITE-HEMATITE STABILITY RELATIONS WITH RELEVANCE TO SEA WATER AND THE RED SEA BRINE SYSTEM,
Woods Hole Oceanographic Institution, Mass.
James L. Bischoff.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc, p 402-406, 1969. 5 p, 1 fig, 9 ref. NSF Grant GA-584.

Descriptors: *Geochemistry, *Sea water, *Iron compounds, *Oxides, *Brines, Oxidation, Chemical reactions, Chemical precipitation, Equilibrium, Oxidation-reduction potential, Hydrate processes, Water chemistry.
Identifiers: *Red Sea, Hot brines.

Goethite is the dominant ferric mineral in all cores from the Red Sea brine deposits with the exception of core station 84 within the Atlantis II Deep where hematite has been transformed from original goethite and limonite. Review of existent thermochemical data allows construction of an approximate stability diagram relating fields of goethite, hematite, and water to T and water activity at 1 to 200 atmospheres total pressure, conditions relevant to sea water and the Red Sea brines. All conceivable 'normal' submarine environments and the Atlantis II brines plot well within the goethite water stability field. Transformation of goethite to hematite at station 84 appears to result from a local temperature anomaly, suggesting a close proximity to a zone of brine discharge. (See also W70-07394) (Knapp-USGS)
W70-07697

CHEMICAL COMPOSITION OF SEDIMENTS AND INTERSTITIAL BRINES FROM THE ATLANTIS II, DISCOVERY AND CHAIN DEEPS,
Kennecott Copper Corp., Salt Lake City, Utah. Exploration Services, and Scripps Institution of Oceanography, La Jolla, Calif
Ruth L. Hendricks, Frederic B. Reisbick, Edwin J. Mahaffey, D. Blair Roberts, and Melvin N. A. Peterson
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea, published by Springer-Verlag New York Inc, p 407-440, 1969. 34 p, 8 tab, 1 ref

Descriptors: *Bottom sediments, *Brines, *Sea water, *Hot springs, Oceanography, Water chemistry, Chemical precipitation, Mineralogy, Sampling.
Identifiers: *Red Sea, Hot brines.

A total of 110 Red Sea brine-deep sediment samples and 58 interstitial water samples have been analyzed by wet chemical and optical spectrographic methods. Most of the interstitial water are essentially saturated with respect to sodium chloride and are enriched in iron, copper, zinc and other heavy metals. The sediment samples show a wide variation in physical appearance and in chemical composition, from oxidized red muds to dark sulfide-rich muds and a few light-colored carbonate-rich samples. Extreme variations in composition are found between adjacent sample sites, and considerable variation is found even within different splits from the same core. Vertical variations in the cores are also extreme, sometimes within a few centimeters of depth. Some of the sulfide-rich parts of this deposit contain high concentrations of zinc, copper and other heavy metals, but the average metal content of the deposits is much lower than would be indicated by these few high values. EVOLUTION OF INTERSTITIAL WATERS IN RECENT ALASKAN MARINE SEDIMENTS,
Alaska Univ., College. Inst. of Marine Science.
G. D. Sharma.
Journal of Sedimentary Petrology, Vol 40, No 2, p 722-733, June 1970. 12 p, 11 fig, 3 tab, 34 ref.

Descriptors: *Diagenesis, *Glacial drift, *Connate water, *Alaska, *Water chemistry, Solutes, Leaching, Water chemistry, Porosity, Clays, Clay minerals, Mineralogy, Glaciers, Sea water.
Identifiers: Gulf of Alaska.

Recent glacio-marine sediments from southeast Alaska were examined in a study of diagenesis in sediments and pore solutions during transfer from the fluvio-glacial to the marine environment. Large amounts of sediments with minimal chemical weathering are deposited in the fiords, channels and bays in this area. Sodium ion concentration in the interstitial waters varies with depth and between cores. Removal of sodium and enrichment of calcium in sea water occurs during early stages of sediment-sea water interaction. Removal of magnesium accompanied by further removal of sodium from sea water results from thorough mixing of sediments and sea water during transport. The changes in the interstitial waters are primarily due to ion exchange between sediments and trapped pore waters. Sediments containing larger silt fractions remove less sodium from trapped waters than those containing less silt. Particle size distribution, range, mineralogy, and the exposure time of sediments appear to control the nature and the content of ion exchange between sediments and sea water. (Knapp-USGS)

API RECOMMENDED PRACTICE FOR ANALYSIS OF OIL-FIELD WATERS.
American Petroleum Inst., Dallas, Tex. Div of Production.

API RP 45, American Petroleum Institute Official Publication, 2nd Edition, November 1968. 49 p.

Descriptors: *Chemical analysis, *Water chemistry, *Oil industry, *Analytical techniques, Colorimetry, Flame photometry, Gravimetric analysis, Photometry, Spectroscopy, Sampling, Data collections.
Identifiers: Oil-field waters.

Standard methods of analysis of oil-field waters as developed and recommended by the American Petroleum Institute are presented in a detailed laboratory practice manual. Methods discussed include wet chemical, spectroscopic, photometric, electrochemical, and gravimetric procedures. Analytical quality, sampling methods, data uses, reports, computer data-processing, precision, accuracy, reliability, and significance of results are explained. (Knapp-USGS)

THE ADAPTATION OF PLANKTON ALGAE. V. VARIATION IN THE PHOTOSYNTHETIC CHARACTERISTICS OF SKELETONEMA COSTATUM CELLS GROWN AT LOW LIGHT INTENSITY,
Royal Danish School of Pharmacy, Copenhagen. Dept. of Botany.
Erik G. Jorgensen.
Physiologia Plantarum, Vol 23, No 1, p 11-17, 1970. 3 fig, 2 tab, 11 ref.

Descriptors: *Photosynthesis, *Diatoms, Pigments, Light, Primary productivity, Sea water, Oceans, Plankton, Laboratory tests, Chlorophyll.
Identifiers: *Skeletonema costatum, Auxospore formation, Cells, Chlorophylla.

The average cells of the diatom Skeletonema costatum, maintained at 3 klux continuous illumination and 20C, decreased their diameter from 8 to 3.5 microns during 6 month vegetative period. A significant correlation was established between cell volume, the rate of photosynthesis, and the content of chlorophyll a. The rate of milligrams carbon per milligram of chlorophyll a/ hour at 1 klux varied between 0.40 and 0.70. The corresponding values for cells deficient in phosphorus or nitrogen were 0.19 and 0.09, respectively. (Wilde-Wisconsin)

THE CHEMICAL ECOLOGY OF THREE SPECIES OF MYRIOPHYLLUM (ANGIOSPERMAE, HALORAGACEAE),
Yale Univ., new Haven, Conn. Dept. of Biology.
G. E. Hutchinson.
Limnology and Oceanography, Vol 15, No 1, p 1-5, 1970. 3 fig, 2 tab, 10 ref.

Descriptors: *Ecology, *Chemical properties, Hydrogen ion concentration, Calcium, Bicarbonates, Photosynthesis, Electrolytes, Hardness (Water), Conductivity, Lakes, Water properties.
Identifiers: *Chemical ecology, *Myriophyllum, Angiospermae, Haloragaceae, Myriophyllum alterniflorum, Myriophyllum spicatum, Myriophyllum verticillatum, Soft water, Sweden, Potamogeton praelongus, Potamogeton pectinatus, Potamogeton alpinus, Potamogeton natans, Potamogeton gramineus, Potamogeton perfoliatus, Myriophyllum exalbescens.

At least four parameters, varying in a correlative way, may affect the physiological processes of plants independently, namely pH, calcium concentration, bicarbonate concentration, and total electrolyte content. Analysis of data published by Lohammar indicates that Myriophyllum alterniflorum occurs in moderately acid, neutral, or slightly alkaline water. Both Myriophyllum spicatum and Myriophyllum verticillatum extend into waters having higher calcium contents than are apparently tolerated by M alterniflorum. Myriophyllum verticillatum has a propensity to occur in waters having a lower pH than those inhabited by M spicatum. The difference is significant and may be correlated with M spicatum's ability, and M verticillatum's inability to use the bicarbonate ion as carbon source in photosynthesis. In a region of northern Sweden, where the lakes did not contain M verticillatum, the soft-water part of its niche may be occupied by M spicatum. Examination of other genera containing two or more species fails to show other clear-cut cases of pH limitation in the alkaline waters studied by Lohammar; usually the more calciphil species seem to require and thrive at high calcium concentrations. It is possible that in very soft water low pH may be limiting. (Jones-Wisconsin)

PHOSPHATE ABSORPTION IN EELGRASS,
Alaska Univ., College. Inst. of Marine Science.
C. Peter McRoy, and Robert J. Barsdate.
Limnology and Oceanography, Vol 15, No 1, p 6-13, 1970. 4 fig, 4 tab, 23 ref.

Descriptors: *Phosphates, *Absorption, Phosphorus radioisotopes, Estuarine environment, Cycling nutrients, Alaska, Waterfowl, Fish, Invertebrates, Tracers, Aquatic plants, Sediments, Sea water, Leaves, Laboratory tests.
Identifiers: *Eelgrass, Zostera marina L, Izembek Lagoon (Alaska), Root hairs, Transport rate, Uptake, Phosphate absorption.

Eelgrass and its associated community is important in the biogeochemical cycle of nutrients in the ocean. Eelgrass is the principal food of hundreds of thousands of migratory waterfowl in Alaska. Additionally fresh or detrital eelgrass feeds numerous species of commercially harvested invertebrates and fishes. The absorption of phosphate by eelgrass (Zostera marina L) was studied using phosphorus-32 in a partitioned container where leaves were separated from roots and rhizomes. The eelgrass uptake of phosphorus-32 was also studied in the natural, undisturbed environment to supplement the laboratory experiments. Absorption, greatest in light, occurred through both leaves and roots, and the absorbed phosphorus was transported rapidly to all parts of the plant. Apparently eelgrass can use phosphate from sediments and from water. Phosphate removed from solution by the roots and rhizomes was returned in part to the surrounding water through the leaves, suggesting that in nature seagrass may act either as a sink or as a source for dissolved phosphorus in estuarine waters. The phosphate absorption depends on metabolism as well as on a physical process of absorption-exchange. (Jones-Wisconsin)

DEVELOPMENT OF THE ASTORIA CANYON-FAN PHYSIOGRAPHY AND COMPARISON WITH SIMILAR SYSTEMS,
Geological Survey, Menlo Park, Calif. Office of Marine Geology and Hydrology; and Oregon State Univ., Corvallis. Dept. of Oceanography.
C. Hans Nelson, P. R. Carlson, J. V. Byrne, and Tau Rho Alpha.
Marine Geology Vol 8, No 3-4, p 259-291, Apr 1970. 33 p, 10 fig, 3 tab, 64 ref. ONR Contract Nonr 1286 (10).

Descriptors: *Bottom sediments, *Continental slope, *Columbia River, *Turbidity currents, *Marine geology, Washington, Oregon, Deposition (Sediments), Sedimentary structures, Stratigraphy, Pacific Ocean, Pleistocene epoch, Deltas, Currents (Water), Erosion, Sediment transport, Suspended load, Sediments.
Identifiers: *Submarine canyons.

A detailed bathymetric study of Astoria Canyon and Astoria Fan off the Oregon-Washington coast provides a model for typical submarine canyon-fan systems. The present canyon head is 9 miles west of the Columbia River mouth but buried Pleistocene channels appear to have connected the two features in the past. The canyon, which is distinguished by its relief, V-shaped profiles, and numerous tributaries, winds sinuously and is coincident with apparent structural trends across the continental shelf and slope. At the fan apex, the canyon mouth merges smoothly into Astoria Channel, which is characterized by its U-shaped profiles, lower walls of even height, and levee development. Similarity of Astoria Canyon-Fan system with other deep-sea fan and alluvial fan systems, suggests the hypothesis that size of drainage basin, sediment size, and sediment load control the size, gradient, and valley development of any fan system. Cutting of Astoria Canyon and the deposition of the unconsolidated sediment layer forming Astoria Fan could have been cut during the Pleistocene. A similar history can be suggested for other major submarine canyon-fan systems. (Knapp-USGS)

SUBMARINE VALLEY SYSTEMS AROUND THE CORAL SEA BASIN (AUSTRALIA),
Scripps Institution of Oceanography, La Jolla, Calif.
Edward L. Winterer.
Marine Geology, Vol 8, No 3-4, p 229-244, Apr 1970. 16 p, 9 fig, 13 ref. NSF Grant GA681.

Descriptors: *Bottom sediments, *Turbidity currents, *Deposition (Sediments), *Pacific Ocean, *Marine geology, Stratigraphy, Sedimentary structures, Provenance, Deltas, Currents (Water), Erosion, Sediment transport, Suspended load, Bed load, Sands, Mud.
Identifiers: *Australia, *Submarine valleys, Submarine canyons, Coral Sea.

Several major and a host of minor submarine valleys and canyons lead into the deep (4,650 m) Coral Sea basin from the surrounding land, reef, and submarine plateau areas. An integrated submarine drainage system collects sediment from nearly the entire Papuan coast and channels it onto the floor of the basin. The Bligh System drains a 900 km sweep of the Great Barrier Reef coast of Queensland and parts of the Queensland Submarine Plateau. Reflection profiles of the valleys show that they are mainly located in structural depressions, but that the submarine relief has been further accentuated by erosional entrenchment of the valleys into older, probably pelagic, sediments to a depth of as much as 750 m. Since the time of the entrenchment, the valleys and many canyons have been backfilled by as much as 500 m of sediment. The valleys may be thought of as graded, and their filling is assigned to adjustments in the long profiles of the valleys as the Coral Sea basin fills with sediment. (Knapp-USGS)
W70-07653

TRANSPORT AND DEPOSITION OF HOLOCENE SEDIMENT ON LA JOLLA DEEP SEA FAN, CALIFORNIA,
Scripps Institution of Oceanography, La Jolla, Calif.
D. J. W. Piper.
Marine Geology, Vol 8, No 3-4, p 211-227, Apr 1970. 17 p, 7 fig, 2 tab, 25 ref. ONR Contract Nonr 2216 (23).

Descriptors: *Bottom sediments, *Turbidity currents, *Continental slope, *Deposition (Sediments), *California, Sedimentary structures, Stratigraphy, Density currents, Deltas, Currents (Water), Erosion, Sediment transport, Suspended load, Bed load, Sands, Mud, Marine geology.
Identifiers: *Submarine canyons.

Near-surface sediments on La Jolla Fan have been studied using over 100 cores, mostly 60 cm long box cores. Sediment distribution on the fan is apparently related to processes acting along the prominent fan valley, which cuts deeply into Pleistocene sediments. The Holocene sediments in the fan valley consist of sands with some interbedding muds; a few of these muds are in thin beds in which the low sand content is graded. All the other muds are bioturbated. On the open fan away from the fan valley, sands are thinner and rarer. Sedimentary structures within the sands suggest they were deposited from relatively powerful currents, of gradually declining competence, carrying large amounts of sediment in suspension; these are thought to be turbidity currents. Much of the mud also appears to have been deposited from turbidity currents. The Holocene sediments on the fan are about 2 m thick, indicating that about 90% of the sediment being supplied to La Jolla Canyon is bypassing the fan. (Knapp-USGS)

THE ENVIRONMENTAL SIGNIFICANCE OF IRON-STAINED QUARTZ GRAINS ON THE SOUTHEASTERN UNITED STATES ATLANTIC SHELF,
Duke Univ., Durham, N.C. Dept. of Geology; and Duke Univ., Beaufort, N.C. Marine Lab.

James B. Judd, William C. Smith, and Orrin H. Pilkey.
Marine Geology, Vol 8, No 5, p 355-362, May 1970. 8 p, 5 fig, 13 ref.

Descriptors: *Sands, *Continental shelf, *Quartz, *Iron oxides, *Provenance, Bottom sediments, Diagenesis, Sediment transport, Littoral drift, Rivers, Deltas, Beaches.
Identifiers: Iron-stained quartz.

An examination of approximately 1,000 continental shelf, beach and river samples from the Atlantic southeastern United States shows that there are significant differences in the percentages of iron-stained quartz grains in two sand-size fractions in each of these major environments. More iron-stained quartz is found in sediments of rivers draining the Piedmont province than those draining the coastal plain. The presence of iron-stained quartz on the shelf may be due in large part to the contributions of rivers during the Pleistocene rather than subaerial weathering of shelf sediments, as indicated by shelf abundance anomalies related to river mouths. These same shelf anomalies are evidence of lack of extensive lateral transportation of sediment on the shelf. Abrasion is apparently not effective in removing the iron coating from the quartz grains in any environment, even in the beach environment. (Knapp-USGS)

COASTAL CURRENTS AND MASS TRANSPORT OF SURFACE SEDIMENTS OVER THE SHELF REGIONS OF MONTEREY BAY, CALIFORNIA,
Geological Survey, Menlo Park, Calif. Office of Marine Geology and Hydrology.
Stephen C. Wolf.
Marine Geology, Vol 8, No 5, p 321-336, May 1970. 16 p, 6 fig, 26 ref.

Descriptors: *Sediment transport, *Bottom sediments, *Currents (Water), *Littoral drift, California, Sediment distribution, Ocean currents, Tides, Shores, Deltas.
Identifiers: Monterey Bay (Calif), Submarine canyons.

In Monterey Bay, California the highest concentrations of medium and fine sands occur nearshore between 10 and 30 fathoms. Silt and clay accumulate in greater depths. Contours of median diameter roughly parallel the isobaths. Fine-grained materials are supplied to the bay region from erosion of cliffs, from sediment laden river discharge, and from continual reworking of widespread sea floor sediments. These sediments in turn are picked up by coastal currents and distributed over the shelf regions by present day current regimes. Studies of bottom currents over the shelf regions and in Monterey Canyon have revealed patterns which vary with seasonal changes. Irregular current flow in the canyon indicates a complex current structure with frequent shifts in direction over very short periods of time. Changes in current regimes are reflected in the patterns of sediment distribution and transport. Sediment transport is chiefly parallel to the isobaths, particularly on the North and South Shelf regions. Some sediments are also transported offshore by rip currents and other agencies and deposited in deeper, quieter waters. Supply of sediments to the canyon head results in over-filling and steepening with subsequent mass movement of sediments seaward followed by deposition in channels and on the broad deep sea fan. Descriptors: *Estuaries, *Hydraulic models, *Mathematical models, *Instrumentation, *Model studies, Physical models, Mixing, Diffusion, Dispersion, *Circulation, Computer simulation, Virginia, Current meters, *Application methods, Dye releases, Oysters, Flow.
Identifiers: *James River estuary, Salinometer.

During the period 1 September 1967 to 30 September 1969, hydraulic model studies, mathematical and computer studies, and instrument and technique development were studied. An investigation was made into the stability and reproducibility of an estuarine hydraulic model. Studies were made of the dispension of point-source dye releases in an estuarine hydraulic model, and of the applicability of the results to the release of disease-resistant seed oysters. Analytical studies were made of diffusion in estuaries and of the integro-differential equations for estuarine flow. Computer studies were made of two-dimensional estuarine circulation and of solution of the one-dimensional equations by analogue simulation. Development was carried out on an automated recording salinometer and on a miniaturized current meter for hydraulic models. Computer techniques were developed for use in hydraulic model work.

ESTUARINE OXYGEN RESOURCES--PHOTOSYNTHESIS AND REAERATION,
Central Coastal Regional Water Quality Control Board, San Luis Obispo, Calif.
Thomas E. Bailey.
Journal of the Sanitary Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 96, No SA2, p 279-295, 1970. 4 fig, 5 tab, 31 ref.

Descriptors: *Estuaries, *Oxygenation, *Photosynthesis, *Reaeration, Chlorophyll, Phytoplankton, Sanitary engineering, California, Dissolved oxygen, Solar radiation, Light intensity, Depth, Temperature, Seasonal, Diffusion, Hydraulics, Tides, Velocity, Eutrophication, Indicators, Methodology, Equations, California.
Identifiers: Sacramento-San Joaquin Estuary, Suisun Bay (Calif), Light extinction.

Maximum photosynthetic rates occurred throughout Sacramento-San Joaquin Estuary April through September. Photosynthesis was maximum in upstream estuarine areas, decreased longitudinally downstream, and increased in shallow embayments. Photosynthesis and directly related to phytoplankton populations and chlorophyll concentrations. An empirical equation estimating photosynthesis as function of chlorophyll concentration, solar intensity, light extinction coefficient, temperature and water depth can be the basis for mathematical models predicting photosynthesis under changing environmental conditions. Oxygen diffused into water column and atmosphere depending on oxygen saturation degree; observations show that diffusion rates were variable, that complex estuarine physical relationships existed influencing reaeration rates, and that empirical equations derived by other investigators were not directly applicable for calculating reaeration rates; independent direct measurements must be made to determine reliable reaeration and oxygen diffusion rates. The most significant finding of this work shows there is no adequate basis for extending numerical reaeration comparisons from one hydrodynamic system to any other. Data collected throughout estuary show that predictive reaeration coefficient equations do err by as much as two orders of magnitude. Predictive equations or models developed for application in shallow streams or artificial channels are appropriately used only in those identical watercourses. (Jones-Wisconsin)

DESIGN AND CONSTRUCTION OF THE WORLD'S LARGEST FLASH TYPE DESALTING PLANT AT TIJUANA, MEXICO,
Gordon F. Leitner.
Western Water and Power Symposium, Proceedings, p C1-C11, 1968. 3 fig, 4 ref.

Descriptors: *Desalination processes, *Water yield, *Brines, *Contracts, *Contract administration, Engineers estimates, Performance, Flash distillation, Procurement, Specifications, Standards, Economics, Employment, Projects, Budgeting, Costs, Cost-sharing, Evaluation, Water policy, Water supply, Water resources development, Water requirements, Governments, Electric power demand, Water costs.
Identifiers: *Turnkey contract, Brine temperature, Brine recirculation, Long tube design, Performance testing, Startup.

In 1956 about 50,000 gallons of water per day were produced by the then-existant flash type desalting plants. Using current construction plans for desalting plants, the author estimates an increase in unit capacity of 1000 times from 1956 to 1976. Administrative techniques of planning, design, and construction of existing facilities have involved either a joint venture on the part of designer-manufacturer firms and consulting engineering firms, or a lone venture on the part of the designer-manufacturer. Empirically, the former arrangement has been best for the client. A 'turnkey' contract is one in which the designer-manufacturer works in concert with the owner through the intermediary of a consulting engineering firm writing specifications and inspecting the work done. A number of existing desalting plants are described in terms of their capacity, planning, and contractual arrangements. An ongoing project involving an integrated stream electric plant and desalting plant in Tijuana, Mexico is described in depth. Comparative cost investigations, financing arrangements, technological details, labor and construction problems, and contractual arrangements are all examined. It is concluded, from the Tijuana experience, as well as that of other facilities, that the 'turnkey' contract is the best management procedure in this highly complex type of undertaking. (Casey-Arizona)

DESIGN AND OPERATION OF LARGE DESALTING PLANTS,
Robert A. Baker, Jr.
Water and Waste Treatment, Vol 12, No 11, p 356-360, Jan-Feb 1970. 5 p, 6 fig.

Descriptors: *Optimization, *Desalination plants, *Design, *Flash distillation, *Cost Economic efficiency, *Water quality.
Identifiers: Kuwait desalting plant, Point Loma plant, Guantanamo Bay.

The present state and future outlook for large water desalting plants were examined using advances in size and efficiency created over the past twelve years. American industry has made these impressive contributions to water desalting. Yet larger plants that realize the field economy of size available from a proven technology (i.e. flash distillation) to reduce cost of water for underdeveloped areas, are needed. The Kuwait land based desalting plant built in 1957 by Westinghouse was cited as an example of flash distillation. The basically simple design involved four stages. Holding down the first cost was more important in this case than designing for high operating efficiency. Since 1957 when the first Kuwait plant went into operation, three more were put into operation in 1968. They produce water for only a fraction of the cost attained in the first large desalting plant. Another plant built at Point Loma, near San Diego, California was designed for efficiency. It had thirty-six stages and operated it with either of two scale control systems. Another built at the Guatnanamo Bay Naval Base in Cuba was a dual-purpose water-desalting plant and optimized full efficiency as well as held down capital cost. Other plants were described which demonstrated continuing change for efficiency and economy. The optimum large plants of the future may incorporate other technologies of flash distillation, and thus produce not only multiple qualities of water, but also reprocess that water for re-use. (Kriss-Cornell)
W70-07854

OPTIMIZATION OF BASIC PARAMETERS OF THERMAL DESALTING PLANTS WITH ADIABATIC EVAPORATION,
A. I. Korneichev, A. V. Izvekov, and A. A. Myagkov.
Desalination, Vol 7, No 2, p 179-186, Feb 1970. 8 p, 4 fig.

Descriptors: *Optimization, *Desalination plants, Economic impact, Mathematical models, Equations.
Identifiers: Parameters, Adiabatic evaporation.

A method for complex optimization of the parameters of a multi-stage desalination plant with adiabatic evaporation or with instantaneous boiling up was presented. The computation of optimal parameters of single as well as dual purpose distillational desalination plants by the proposed method was proven not complicated. The problem of choosing the parameters was of primary importance so that the solution could have a high economic effect. Optimization of the parameters was a search for the optimal solution out of a large number of possible alternatives both as to the basic parameters of the working process, and as to special parameters and design solutions for individual plant elements. As a criterion of the optimal quality of the solution arrived at for single-and dual purpose desalting plants, the minimum specific computed expenditure on producing the distillate was taken. The equations for the mathematical model of a desalination plant with adiabatic evaporation were given. The outlined optimization method was said to be applicable to other types of desalination plants. (Kriss-Cornell)
W70-07860

OPTIMUM OPERATION OF DESALTING PLANTS AS A SUPPLEMENTAL SOURCE OF SAFE YIELD,
Utah Water Research Lab., Logan.
Calvin G. Clyde, and Wesley H. Blood.
Final Report to the Office of Saline Water, US Dept of the Int, Utah State Univ, Logan, Utah, July 1969. 127 p, 19 fig, 15 tab, 6 ref, 3 append. PRWG-61-2.

Descriptors: *Digital computers, *Optimization, *Simulation analysis, *Desalination plants, *Design, *Decision making, Reservoirs, Water resources, Hydrologic data, Hydrographs, Water demand.
Identifiers: Cachuma, Deer Creek, New York City.

The specific objectives of the research were: (1) to develop a digital computer program to conveniently determine the optimum operating rule for conjunctive operation of a desalting plant in order to help assess alternatives and to aid in decision making concerning plant design; (2) to apply the Operating Rule Program to three real-life situations where a desalting plant was operated in conjunction with a reservoir and water system; and (3) to assess the impact of conjection operation on the performance characteristics and the design of a desalting plant used in intermittent service and to identify the unique features of such plants. The Operating Rules Program received central focus and its general format was easily applicable to a wide variety of conditions. To find the optimum rule the historical hydrologic data for the reservoir and the water system were first analyzed. Long hypothetical streamflow sequences were then generated. Using the generated hydrographs along with the given reservoir characteristics and an assumed desalting plant capacity, the operation of the desalting plant was simulated by the computer program to test the ability of the various proposed rules to meet the needed water demand. The three real water systems studied were the Cachuma Project near Santa Barbara, California; the Deer Creek Project near Salt Lake City, Utah; and the NYC water supply system. Sensitivity of the optimum operating rule and the associated costs to changes in various input parameters were described. Additional useful research opportunities were suggested. (Kriss-Cornell)

VEGETATION MANAGEMENT FOR WATER YIELD,
Forest Service, (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
Marvin D. Hoover.
Symposium on Water Balance in North America, Banff, Alberta, Canada, June 23-26, 1967, p 191-195. Proceedings Series 7, Amer. Water Res. Ass'n, Urbana, Ill.

Descriptors: *Water yield improvement, *Vegetation effects, *Watershed management, *Water balance, *Snow management, *Snowmelt, Snowpacks, Timber harvest, Interception, Evapotranspiration, Weather modification, Clearcutting.
Identifiers: Multiple-use management, *Experimental watersheds, Forest patterns, Logging.

Kind, size, and arrangement of plant cover affect distribution of precipitation, snowmelt rates, soil water storage, evaporation and transpiration. These effects are of most significance to streamflow in forested areas where precipitation is comparatively abundant or concentrated into the cool season. These conditions are typical of the source areas for our rivers. Large-scale management of these lands for water may be possible because they are held in large blocks and much is publicly owned. Knowledge is sufficient to select areas of high potential for increased water yield. Yield increases tend to be greater during normally high runoff periods and in wet years. Economic value of such yield increases depends on water uses in the basin and on available storage. Large areas in the West approach ideal vegetation patterns and are now yielding near their potential. Where tree products are merchantable, water increase can be a valuable by-product of timber harvesting. However, where timber is of low wood value or high efficiency in water production desired, financing for water improvement must be found. Artificial augmentation of precipitation appears to offer promise for mountain areas which are often forest covered. Successful weather modification would increase the efficiency of vegetation management practices.

Evapotranspiration, Water yield, Water yield improvement, Carrying capacity.
Identifiers: *Australia.

A method for evaluating infiltration and evapotranspiration for experimental catchments was applied to a series of four-acre catchments near Bacchus Marsh, Victoria, Australia. Differences in runoff between two levels of native pasture production are the direct result of changes in infiltration. On the more productive pasture containing perennial grasses, the infiltration rate was higher because of a larger capacity for moisture storage in the topsoil, and higher rates of water movement in the subsoil. The conversion of both levels of native pasture to annual improved pasture was associated with a reduction in runoff in each case, due to increased evapotranspiration during periods when soil moisture conditions are assumed to be nonlimiting (topsoil moisture potential less than pF 3.5). The larger deficits developed in the soil moisture store led to increased infiltration and reduced runoff from rainfall events. The use of these findings to predict runoff, and their implications for catchment management, are discussed. (Knapp-USGS)

WEATHER MODIFICATION IN POPULATED AREAS,
EG and G, Inc., Bedford, Mass.
Wallace E. Howell.
In: Proceedings of the Fourth American Water Resources Conference (American Water Resources Association, Urbana, Illinois, 1968), ed. Phillip Cohen, Martha N. Francisco, p 613-622. 1 tab, 5 ref.

Descriptors: *Weather modification, *Cloud seeding, *Political aspects, *Attitudes, Droughts, Regulation, Education.
Identifiers: Weather Bureau, National Academy of Sciences, New York City, Mid-Potomac Valley, Fatalistic life outlook, Cooperative life outlook, Purposive life outlook, Familiarity.

Considerable speculation has been given to the social problems which could result from weather modification projects. In order to understand what attitudes have been expressed thus far, a fifteen case study has been compiled for all cloud seeding programs conducted between 1951 and 1965, is reviewed. All but two of these were conducted for the purpose of rain stimulation during a drought period. Of the two exceptions, one was purely experimental and the other was primarily for the purpose of hail mitigation with drought relief only a secondary objective. In all cases, with exception of the hail mitigation project, the public response was one of total indifference. It is suggested that the increased quantity of precipitation is not readily discernible. An average increase of twenty per cent is estimated from analyses to date; this was without causing an increase in the number of rainy days or producing any other recognizable abnormality in the weather. The hail mitigation project is discussed at length and opposition is described as having come from farmers who had not participated in the project and who believed that it had caused a drought. At present, no legislation curtailing weather modification has passed although a bill introduced by Representative Staggers could prohibit cloud seeding nationally. Lack of legal constraints in the public interest are suggested as producing mistrust; two social psychological studies investigating latent attitudes are also reviewed. Finally, the implications of weather modification are discussed for New York City and western New York state. (Davis-Chicago)

MODELS OF PRECIPITATING CUMULUS TOWERS,
Environmental Science Services Administration, Miami, Fla. Atmospheric Physics and Chemistry Lab.
Joanne Simpson, and Victor Wiggert
Monthly Weather Review, Vol 97, No 7, p 471-489, July 1969. 17 fig, 4 tab, 60 ref.

Descriptors: *Cloud seeding, *Artificial precipitation, *Hydrometers, Cloud physics, Buoyancy, Model studies, Radar, Supercooling, Silver iodide.
Identifiers: *Cumulus clouds, Maritime cloud, Autoconversion.

A model of the growth of cumulus clouds is presented. The water content and maximum height of rising towers are calculated using a buoyancy equation with consideration of effects of entrainment and water load. The latter is subject to effects of modeled microphysical effects. Precipitation growth is parameterized in terms of an autoconversion equation and a collection equation. A precipitation fallout scheme is devised that depends on water content, drop spectrum, and the vertical rise rate of the tower. Then 'freezing subroutines' are devised to model the effects of silver iodide seeding. A hierarchy of seeding routines, using different ice collection efficiencies and terminal velocities, is partially tested against the data of the Stormfury 1965 tropical cumulus-seeding experiment. Some preliminary numerical experiments on warm clouds are performed, assuming changes in drop spectra from hygroscopic seeding. (Osborne-Vanderbilt)

3C. Use of Water of Impaired Quality

RESEARCH ON THE UTILIZATION OF SALINE WATER FOR IRRIGATION IN TUNISIA,
Research Center for the Utilization of Saline Water for Irrigation (Tunisia).
J. M. de Forges.
Nature and Resources, Vol 6, No 1, p 2-6, March 1970. 3 tab.

Descriptors: *Saline water, *Water quality, *Irrigation water, *Irrigation effects, *Fertility, Arid lands, Semiarid climates, Irrigation, Irrigation practices, Brackish water, Land reclamation, Soil moisture, Soil properties, Soil structure, Drainage, Drainage effects, Crops, Crop production, Crop response, Rainfall, Leaching, Saline soils.
Identifiers: *Tunisia, *Irrigated agriculture.

The results of Tunisia's study of saline water use for irrigation purposes is reviewed by one of the program consultants. The major emphasis of the project lay in discovering whether soil fertility in semiarid areas could be maintained when the soil was irrigated by saline water. More specifically, the study was designed to determine the effect of brackish water on soils and decide what crops can be grown on soils irrigated by saline water. Although soil salinity did increase when land was irrigated with brackish water, it was always possible to reduce salinity with little difficulty. Salinity reduction was facilitated by the good natural or artificial drainage of all the lands under study. The project also showed that although soil salinity did reduce crop yield, it was not an insurmountable difficulty. Crops were affected by other factors common to semiarid zone irrigation, such as the adverse nature of soil structure and periods of plant fragility due to excess or insufficient soil moisture. While the results of this study may be applied to other irrigated areas, it should be remembered that naturally saline soils, alkalinity, and boron contamination were not matters of concern in Tunisia and therefore were not investigated. SURFACE IRRIGATION WITH SALINE WATER ON A HEAVY CLAY SOIL IN THE MEDJERDA VALLEY, TUNISIA,
Institute for Land and Water Management Research, Wageningen (Netherlands); and Office de la Mise en Valeur de la Basse Vallee de la Medjerda, Tunis (Tunisia).
J. A. van't Leven, and M. A. Haddad.
Netherlands Journal of Agricultural Science, Vol 15, No 4, p 281-303, Nov 1967. 8 fig, 16 tab, 11 ref.

Descriptors: *Irrigation effects, *Surface irrigation, *Irrigation water, *Clays, *Saline water, Irrigation, Irrigated land, Land reclamation, Saline soils, Semiarid climates, Salinity, Water quality, Leaching, Groundwater, Water table, Water level fluctuations, Surface-groundwater relationships, Agronomic crops, Alfalfa, Soil types, Soil texture, Soil profiles, Salt balance, Drainage, Rotations, Crop response, Climatology, Discharge (Water).
Identifiers: *Tunisia, *Medjerda Valley, *Irrigated agriculture, Artichokes.

The Tunisian government, interested in reclaiming land and increasing food production in the Medjerda Valley, initiated a soil salinization study in 1962. The experiment looked at the salinization problem in terms of climatological factors, drainage, crop growth, crop rotation, saline soil, and saline water irrigation. Among the complications in attempting to farm the Medjerda area are heavy clay soils, shallow depth to saline groundwater, and the necessity of irrigating for 8-9 months of the year. The Medjerda Project is briefly described and a long list of results and conclusions of the experiment is given. (Carr-Arizona)

3D. Conservation in Domestic and Municipal Use

HOWELL V SEWICKLEY TOWNSHIP (SUIT TO ENJOIN OPERATION OF RESERVOIR AS TOWN WATER SUPPLY).

352 Pa 552, 43 A2d 121-127 (1945).

Descriptors: *Pennsylvania, *Reservoir operation, *Water utilization, *Municipal water, Reservoirs, Leases, Pumped storage, Reservoir storage, Water supply, Cities, Land tenure, Land use, Water rights, Land ownership, Legal aspects, Contracts, Judicial decisions, Land, Pumping, Pumps, Dams, Water storage, Remedies.

Plaintiff land owner sought a mandatory injunction against defendant township's proposed improvements of a pumping facility which was located on leased property. Plaintiff's contention, among others, was that the township's use of the water as a municipal supply constituted an unreasonable use and was a breach of conditions of the lease. The Supreme Court of Pennsylvania held that the use of the water from the reservoir as a municipal supply was not a breach of conditions of the lease and might at worst be held to be a breach of covenant. The trial court's judgment in favor of defendant was affirmed. (Barker-Florida)

CITY OF SYRACUSE V GIBBS (POWER OF THE STATE TO CONTROL ITS WATER RESOURCES).
283 NY 275, 28 NE2d 835-842 (1940).

Descriptors: *New York, *Water rates, *Water supply, *State jurisdiction, Water works, Judicial decisions, Legal aspects, Pipelines, Water allocation (Policy), Water conveyance, Water distribution (Applied), Water resources, Reasonable use, Administrative agencies, Administration, Legislation, Domestic water, State governments, Competing uses, Relative rights, Drainage, Usufructuary right, Utilities, Municipal water, Cities.

The State Water Power and Control Commission approved the village of Jordan's plans for the construction and operation of a municipal water system. The village was to draw its water supply from the city of Syracuse's lake source, utilizing Syracuse's water mains. Negotiation between Syracuse and the village failed to arrive at a service rate for the use of the mains. The village applied to

he Commission for a determination of the applicable rate. Dissatisfied with the Commission's determination, Syracuse appealed. The lower court reversed and the Commission appealed. Syracuse objected to the Commission's finding that its water supply could be appropriated by the state for other public uses. The court found exclusive dominion of the waters to be in the state. It is the state's duty to control its water resources for the benefit of all the state's inhabitants. The public right to the benefits of such resources was found to be an incident of sovereignty. The determination of the service rate was held to be a valid exercise of delegated authority to the Commission in protecting the interest of the state in its public waters. (Barnett-Florida)

CITY OF NEWARK V PASSAIC VALLEY WATER COMM'N (RELATIVE RIGHTS OF CITIES IN DISTRIBUTION OF RESERVOIR WATER).
192 A 835-836 (NJ Ch 1937).

Descriptors: *New Jersey, *Municipal water, *Reservoirs, *Water allocation (Policy), Water demand, Water consumption, Reservoir construction, Legal aspects, Judicial decisions, Regulation, Reservoir yield, Water distribution (Applied), Water management (Applied), Water supply, Relative rights, Impounded waters, Administrative agencies, Water rights, Adjudication procedure, Contract administration, Allotments, Coordination, Local governments.

Plaintiff municipality and defendant water commission, which represented another municipality, had together constructed a reservoir. Defendant sought to sell water from the reservoir to a third city pursuant to a contract with plaintiff providing that prior to the actual consumption by plaintiff and defendant cities of their respective allotments, either municipality was at liberty to authorize the commission to dispose of the allotments on their behalf to a third city. Plaintiff sought to enjoin the sale of water to the third city alleging the contract was void without its consent to a sale and that it was inequitable to allow the third city to obtain water at less than cost. Defendant moved to strike the bill in equity. The court held that the contract between plaintiff and defendant seemed to clearly indicate that neither municipality could prevent the sale of water by the other. However, the court refused to strike the bill stating that community water supply is a matter of great public concern and, pursuant to the court's power to regulate water use, it would consider other relevant facts in a hearing. (Hubener-Florida)

3F. Conservation in Agriculture

MEASURED AND ESTIMATED WATER USE BY A CITRUS AND AN APPLE ORCHARD,
Food and Agriculture Organization of the United Nations, Tal-Amara (Lebanon); and Lebanon Agricultural Research Inst., Tal-Amara. Dept. of Irrigation Engineering.
N. Vink, A. Aboukhaled, and S. Sarraf.
Magon, Serie Technique, Publication No 11, Jan 1970. 18 p, 4 fig, 5 tab, 19 ref.

Descriptors: *Water utilization, *Irrigation efficiency, *Orchards, *Citrus fruits, *Apples, Lemons, Oranges, Crop response, Irrigation effects, Timing, Irrigation practices, Irrigation, Consumptive use, Evapotranspiration, Soil-water-plant relationships, Moisture availability, Moisture stress, Moisture tension, Soil moisture, Moisture uptake, Soil water, Soil types, Saturation.
Identifiers: *Lebanon, *Water use efficiency, *Irrigation requirements.

Water utilization by mature apple and citrus orchards in Lebanon was studied for a 112-day period in June-September 1969. Measured evapotranspiration (ET) for citrus ranged between 3.3 and 4.9 mm/day and reached a total of 445 mm. Total ET was estimated by the Modified Blaney Criddle formula to be 451 mm. Net seasonal (April-November) irrigation requirement for citrus was between 650 and 700 mm, given in 11 to 13 irrigations. Since the orchards grew on heavy clay soil, slight water stress under 3-week irrigation intervals was preferable to saturation of deeper soil layers by more frequent and abundant irrigation. ET for apple trees ranged from 4.9 to 7.0 mm/day. Measured ET for 61 days (1968) and 92 summer days (1969) was 373 and 480 mm respectively. ET calculated for these same periods was 336 mm and 506 mm, resulting ina relatively high deviation between measured and estimated ET. Net seasonal (May-September) irrigation requirement for apples was approximately 680 mm, given in 7 or 8 irrigations. On the deep clay soils 85-90% of total moisture extraction was from the top 1.20 m of the soil profile for apple trees and from the top 0.60 m for citrus. (Carr-Arizona)

CONTROL OF SOIL MOISTURE DURING SPRINKLER IRRIGATION,
Utah State Univ., Logan. Dept. of Agricultural and Irrigation Engineering.
Jack Keller.
American Society of Agricultural Engineers, 1968 Summer Meeting, Logan, Utah, June 18-21 1968, Paper No 68-243. 28 p, 8 fig, 2 tab, 19 ref.

Descriptors: *Irrigation effects, *Sprinkler irrigation, *Rates of application, *Soil moisture, *Analog models, Irrigation design, Irrigation practices, Aeration, Soil structure, Soil water, Moisture content, Soil profiles, Capillary conductivity, Saturation, Infiltration, Pores, Wetting, Equations, Bulk density, Irrigation, Crop production.

When soil moisture is controlled during irrigation it is possible to maintain better soil tilth and aeration. Under sprinkler irrigation regimes the moisture content of the wetted zone of the soil profile has been found to be a function of application rate. Since aeration and tilth affect crop yields, rate of application is an important design consideration for sprinkler irrigation systems. Using a pore-channel analog, the author developed an equation which related application rate to moisture content in the transmission zone of a deep soil profile. The equation is dependent on the soil but is independent of its bulk density. Laboratory experiments on various types of soil strongly supported the equation and its associated theory. MICROBIOLOGICAL PROBLEMS OF THE ARID ZONE,
Cornell Univ. Ithaca, N.Y. Lab. of Soil Microbiology.
M. Alexander.
Second International Conference on Global Impacts of Applied Microbiology, Interscience Publishers, No 1, p 285-291, 1969.

Descriptors: *Microbiology, *Arid lands, Diseases, Soil microorganisms, Aquatic microorganisms, Xerophytes.
Identifiers: *Applied microbiology.

The introduction of irrigation water to arid lands often creates unique problems directly or indirectly related to microbiology. Many of these have not been carefully studied. The author lists a number of areas and potential problems which would benefit from increased microbiological research: (1) Animal husbandry--problems involving nutrition and communicable diseases so that animal production per unit of land may be increased; (2) Rumen microbiology--including a survey of factors influencing rumen microflora; (3) Plant pathology--as total plant biomass increases in arid zones, indigenous pathogens become more important; (4) Groundwater recharge--particularly problems involving the production of polysaccharide plugs by bacteria; (5) Reclamation of saline soils; (6) Microbiological factors in improvement of soil structure; (7) Nitrogen production-root-nodule bacteria and symbiotic plants, and possible heterotrophic nonsymbiotic N fixation; (8) Biological control of insects. USE OF SOIL, WATER AND LEAF ANALYSES IN GROWING ORANGES IN JORDAN,
Ministry of Agriculture Amman, (Jordan). Research Dept.
R. F. Allbrook.
Experimental Agriculture, Vol 3, No 3, p 215-222, July 1967. 6 tab, 12 ref.

Descriptors: *Oranges, *Soil-water-plant relationships, *Soil analysis, *Water analysis, *Irrigation water, Irrigation practices, Irrigation, Orchards, Leaves, Phosphorus, Potassium, Sodium, Chlorides, Nitrogen, Citrus fruits, Fruit crops, Standards, Arid lands, Semiarid climates, Water quality, Water types, Saline water, Salinity, Fertilizers, Fertilization, Nutrient requirements, Soil types, Saline soils.
Identifiers: *Leaf analysis, *Irrigated agriculture, *Jordan, Jordan Valley, Chlorosis.

Irrigated orange orchards in the Jordan Valley were sampled for soil, water, and leaf analyses. Most of the irrigation water was of good quality. However, use of water containing high sodium and chloride content increased the amount of these ions in the soil and caused such undesirable effects as leaf chlorosis. Soil analysis indicated that variations in soluble phosphorus and potassium ions were related to salinity of the irrigation water. Analysis of the leaves showed that chemical composition charged with age, but that the only significant difference among varieties was in potassium percentage. The author suggests standards of analysis for water, soil, and leaf composition that can be used when growing citrus. He also recommends that in order to keep soil salinity low, irrigation water class C3-S1 should not be used when annual precipitation is less than about 300 mm. (Carr - Arizona)

GENETIC VARIABILITY IN ROOT DEVELOPMENT IN RELATION TO DROUGHT TOLERANCE IN SPRING WHEATS,
Sydney Univ., Narrabri (Australia). North West Wheat Research Inst.
N. F. Derera, D. R. Marshall, and L. N. Balaam.
Experimental Agriculture, Vol 5, No 4, p 327-337, October 1969. 4 fig, 5 tab, 16 ref.

Descriptors: *Genetics, *Root development, *Drought tolerance, *Wheat, *Plant growth, Soil-water-plant relationships, Root systems, Plant breeding, Growth stages, Crop response, Drought resistance, Droughts, Moisture stress, Soil moisture, Water utilization, Evapotranspiration, Plant physiology, Plant morphology, Crop production, Grains (Crops), Cereal crops, Moisture deficit, Moisture availability, Arid lands, Semiarid climates.
Identifiers: *Australia, *Spring wheat, Water use efficiency, Jointing, Nodes.

Wheat production in northwestern New South Wales and southern Queensland is limited by the

general drought problem, but especially by the lack of predictable precipitation during the late-winter early-spring jointing and flowering period. Since the plants are dependent on sub-soil moisture accumulate during the summer fallow period, extent of root exploration for moisture reserves would appear to be a major determinant of drought tolerance. Fifteen varieties of Australian and exotic wheat were studied for genotypic differences in drought tolerance and patterns of root development. Early maturity appeared to be the most important characteristic of tolerant genotypes and accounted for 40 to 90 percent of observed variation in drought tolerance. There were, however, measurable relationships between water use efficiency, drought tolerance, and some root development parameters. Attributes which should receive more attention in breeding studies are length per unit weight of root, amount of nodal root development, and root activity between late jointing and maturity. CARROT POPULATION DENSITY AND YIELD IN AN ARID ENVIRONMENT,
California Univ., Davis. Dept. of Water Science and Engineering.
Frank E. Robinson.
Agronomy Journal, Vol 61, No 4, p 499-500, July-August 1969. 2 fig, 3 tab, 3 ref.

Descriptors: *Carrots, *Density, *Sprinkler irrigation, *Crop production, *Arid lands, Arid climates, California, Root systems, Plant growth, Growth stages, Vegetable crops, Irrigation, Irrigation practices, Irrigation systems, Sprinkling, Size, Weight.
Identifiers: *Population density, *Dry matter, *Imperial Valley.

In an experiment in the Imperial Valley of California, population density of Daucus carota L. cultivar 'Long Imperator No 58' was studied under sprinkler irrigation. Seeds were placed on five square grid systems, with squares of 10.2, 5.1, 2.5, 1.3, and 0.6 cm on each side. These sizes corresponded with plant densities per ha of 870,000, 3,337,000, 13,590,000, 54,390,000, and 223,050,000, respectively. Of the five densities studied, carrots on the 10.2-cm square grid produced the earliest roots of marketable size, but the least dry matter. Twenty-five days later the plants on the 5.1-cm square grid produced greater yields in dry matter and roots of marketable size. The three highest plant densities yielded even greater amounts of dry matter but produced no roots of marketable size. There was a 2:1 root-to-top ratio for the three lowest plant densities and a 1:1 ratio for the two greatest densities. Under present market criteria and the arid conditions of the Imperial Valley, it does not appear advisable to plant carrots in densities greater than 3.3 million plants per ha. (Carr - Arizona)

WATER RELATIONS OF BEANS; II. EFFECTS OF DIFFERENTIAL IRRIGATION ON YIELD AND SEED SIZE OF BROAD BEANS,
Khartoum Univ. (Sudan). Dept. of Agronomy.
A. H. El Nadi.
Experimental Agriculture, Vol 6, No 2, p 107-111, April 1970. 1 fig, 4 tab, 7 ref.

Descriptors: *Beans, *Irrigation effects, *Irrigation efficiency, *Crop response, *Crop production, Seeds, Irrigation, Soil-water-plant relationships, Plant physiology, Water utilization, Water requirements, Timing, Size, Agronomic crops, Plant growth, Growth stages, Evaporation, Leaves, Economic efficiency, Drought, Moisture stress, Soil moisture, Flowering, Moisture content, Arid lands.
Identifiers: *Broad beans, *Sudan, *Irrigated agriculture, *Water-use efficiency, Pods, Potential evaporation.

A crop of broad beans was grown under four different irrigation regimes in an effort to determine the most economical irrigation policy. Plants were subjected to 'wet' or 'dry' irrigation treatments during two growth phases, resulting in wet/wet (WW), dry/wet (DW), wet/dry (WD), and dry/dry (DD) irrigation regimes. The WW treatment produced the highest yield per plot and resulted in the greatest water-use efficiency (as determined by weight of seeds per irrigation). It was also the most economically justifiable treatment, since the value of the increases seed yield was about five times the cost of the extra irrigation. The study revealed other information of interest to irrigators, such as the influence of growth stages on the effect of additional irrigation. (Carr - Arizona)

EFFECT OF PLANT DENSITY AND GROWTH DURATION ON GRAIN SORGHUM YIELD UNDER LIMITED WATER SUPPLY,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
A. Blum.
Agronomy Journal, Vol 62, No 3, p 333-336, May-June 1970. 5 fig, 1 tab, 13 ref.

Descriptors: *Sorghum, *Crop production, *Limiting factors, *Density, *Water supply, Environmental effects, Arid lands, Semiarid climates, Soil moisture, Soil water, Moisture stress, Vegetation effects, Plant populations, Plant growth, Growth stages, Mature growth stage, Growth rates, Time, Competition, Grains (Crops).
Identifiers: *Israel, *Water-use efficiency, *Plant density, Hybrid sorghum.

Hybrid grain sorghum grown entirely by stored soil moisture was studied in two experiments in Israel. In one experiment, sorghum hybrids were planted in 12 densities ranging from 2.9 to 27.9 plants per square meter and grown with 302 mm available soil water. Grain yield of an early maturing hybrid was highest under high plant density and yield of the late maturing hybrid was highest under low density. These relationships were also consistent regarding yield per plant, number of heads per plant, and number of grains per panicle. The highest yield for the entire experiment was from the earliest maturing hybrid planted at the densest population. Grain yield components were suppressed by increased competition and the early maturing hybrid at highest density attained its superiority by maintaining larger grain size in spite of increased interplant competition for water. A second experiment found that water use increased with increasing plant density. An early maturing hybrid used less water at all stages of growth than a later maturing hybrid. (Carr-Arizona)
W70-07789

SOME EFFECTS OF SOIL MOISTURE STRESS ON THE GROWTH OF WHEAT (TRITICUM AESTIVUM L. EM THELL.),
Arizona Agricultural Experiment Station, Tucson.
A. D. Day, and Suhbawatr Intalap.
Agronomy Journal, Vol 62, No 1, p 27-29, Jan-Feb 1970. 3 tab, 14 ref.

Descriptors: *Wheat, *Soil moisture, *Moisture stress, *Plant growth, *Crop response, Crop production, Seeds, Grains (Crops), Growth stages, Flowering, Arid lands, Arizona, Water requirements, Water utilization, Soil water, Irrigation, Irrigation effects, Environmental effects, Cereal crops, Particle size, Soil-water-plant relationships.
Identifiers: *Spring wheat, Jointing, Dough, Grain weight.

The effects of soil-moisture stress on growth and grain yield of spring wheat were studied in Arizona in 1966 and 1967. The wheat was planted in December and stressed at three different stages of development: jointing, flowering, and dough. The critical period for moisture was the jointing stage. Moisture stress at jointing resulted in earlier maturity, shorter plants, increased lodging, fewer seeds per head, fewer heads per unit area, lower grain volume-weight, and lower grain yield. Stress at any growth stage hastened maturity and decreased grain yield. However, when wheat was stressed at jointing grain yield reduction was due to fewer seeds per head and fewer heads per unit area, while lower yields in wheat stressed at flowering or dough resulted from lighter seed-weight. In order to achieve maximum grain yield, optimum irrigation must be provided throughout the entire growing season, not just during the critical jointing stage. (Carr-Arizona)

EFFECTS OF SEEDING RATE AND ROW SPACING ON ESTABLISHMENT AND YIELD OF CRESTED WHEATGRASS,
Agricultural Research Service, Fort Collins, Colo. Crops Research Div.; and Colorado Agricultural Experiment Station, Fort Collins.
William J. McGinnies.
Agronomy Journal, Vol 62, No 3, p 417-421, May-June 1970. 6 tab, 9 ref.

Descriptors: *Wheatgrasses, *Range grasses, *Planting management, *Crop production, *Soil moisture, Range management, Forage grasses, Forages, Grasses, Semiarid climates, Colorado, Proteins, Moisture availability, Moisture stress, Soil-water-plant relationships, Rainfall, Weeds.
Identifiers: *Crested wheatgrass, *Seeding rate, *Row spacing, *Stand establishment, *Herbage yield, Stand survival, Seedstalk height.

In range experiments on crested wheatgrass (Agropyron desertorum (Fisch. ex Link) Schult.) in northern Colorado, row spacing affected herbage yield, protein content, and seedstalk height and seeding rate influenced stand establishment and survival. Rows were seeded each spring in 1960, 1961, and 1962 at the rate of 33, 66, and 98 seeds/m. As seeding rate increased there was a corresponding increase in number of seedlings per m of row, but a decline in percentage of seeds producing seedlings. When the study ended in 1967 stand survival for the 98-seed rate was significantly better than for the 33-seed rate. Row spacings of 15, 30, 46, 61, and 76 cm were also studied. Herbage yield was highest for 30 and 46-cm spacings and lowest for 76-cm spacings, but yield varied widely among spacings due to age of stand, weather conditions, and year of seeding. As row spacing widened, seedstalk height increased. Although spacing showed no effect on protein content of the 1963 harvest, percent crude protein declined in 1964 when row spacing increased. All combinations of the 3 seeding rates and 5 row spacings were tested. (Carr-Arizona)

SOME ASPECTS OF WATER MANAGEMENT FOR CROP PRODUCTION IN ARID AND SEMIARID ZONE OF INDIA,
Central Arid Zone Research Inst., Jodhpur (India).
A. Krishnan.
Annals of Arid Zone, Vol 8, No 1, p 1-17, Mar 1969. 1 fig, 9 tab, 20 ref.

Descriptors: *Arid lands, *Semiarid climates, *Evapotranspiration, *Moisture deficit, Irrigation programs, Climatic data, Droughts, Water loss, Consumptive use, Lysimeters, Precipitation, Agriculture, Crops, Root systems, Hydrologic budget.
Identifiers: *India, *Invisible drought, *Aridity index, Crop growing period.

In the most arid zones in India drought is permanent while in other arid and semiarid zones

there are seasonal rains. Agriculture is impossible in most areas without irrigation. The rainfall over these regions is erratic even within the rainy seasons and invisible drought may occur in which rainfall is inadequate to compensate for evapotranspirational losses. It is therefore necessary to gather adequate data to facilitate planning for suitable water management and crop planting. The arid and semi-arid zones of India are delimited in terms of land area, rainfall distribution, temperature patterns and the mean aridity index. The importance of potential and actual evapotranspiration studies is stressed and a network of lysimeters throughout the country is recommended. Estimates of moisture storage capacities of crop root zones in various soils are also needed. (Casey-Arizona)

04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on the Surface

MARR V HEMENNY (IMPOUNDED WATERS).

297 NW 504-505 (Mich 1941).

Descriptors: *Michigan, *Mill dams, *Flooding, *Impounded waters, Dams, Riparian rights, Dam construction, Judicial decisions, Legal aspects, Riparian waters, Riparian land, Flood damage, Dam design, Engineering structures, Ponds, Relative rights, Water utilization, Water law, Remedies, Prescriptive rights, Maintenance, Repairing, Water level fluctuations.

Defendants were the owners of a dam which impounded the waters of a creek. Plaintiff was the owner of riparian lands bordering on the mill pond above the dam. The wooden gates of defendants' dam became leaky and out of repair and insufficient to maintain any effective head of water. Twenty-five years later, the defendants installed steel gates in the dam which caused a rise in the pond water level and flooded part of plaintiff's lands. Prior to the dam reconstruction, plaintiff's lands had not been flooded and had been used for agricultural purposes. Plaintiff's judgment for damages and injunctive relief was affirmed by the Michigan Supreme Court. The court reasoned that the extent of a prescriptive right to cast water upon the land of another was measured by the lands actually flooded and not by the height of the dam. Consequently, defendants had no right, by means of repairs, making the dam capable of maintaining a larger head of water, to flood additional upper riparian lands. It did not matter that the dam height was not increased. (Powell-Florida)

EXIT GRADIENTS INTO SUBSURFACE DRAINS,
James N. Luthin, George S. Taylor, and Cesar Prieto.
Hilgardia, Vol 39, No 15, p 419-428, December 1968. 6 fig, 3 ref.

Descriptors: *Subsurface drainage, *Seepage, *Hydraulic gradient, *Drainage effects, *Soil texture, Soil density, Soil strength, Soil types, Cohesive soils, Cohesionless soils, Gravels, Sands, Sediments, Flotation, Void ratio.
Identifiers: *Quick condition, *Gravel envelopes, Kirkham's law, Soil particle weight, Surcharge load.

Water moving upward through a vertical gradient under the pressure of hydrodynamic seepage forces may cause the movement of sediments into a drain line if the soils in the vicinity of the drain line lack sufficient cohesiveness. This problem is minimal in the stable soils commonly found in the Midwest but may be quite significant in the relatively structureless soils of the western United States. The situation where by upward lifting forces create a weightless condition of the solid materials of the composite soil is known as the quick condition. In upward moving water the hydrodynamic seepage forces are opposed by gravitational forces, surcharge loads and soil cohesive forces. The resultant will determine whether a quick condition occurs. The hydraulic gradient where the seeping water emerges from the soil is called the exit gradient. A number of theoretical exit gradients into drain pipes under differing conditions of drain spacing, drain outer diameters, drain depths and drain barrier layers, were calculated using Kirkham's equation for hydraulic head potential and stream function. A flow net in the vicinity of a theoretical gravel envelope was also constructed. It was concluded that the use of a gravel envelope significantly decreases the exit gradient and therefore decreases sedimentation in the drain lines. (Casey - Arizona)

THE DETERMINATION OF THE DRAINAGE FACTOR AS A CRITERION FOR THE SOILS OF THE INDUS PLAINS,
International Land Development Consultants, Arnhem (Netherlands).
W. C. Hulsbos.
Netherlands Journal of Agricultural Science, Vol 16, No 1, p 25-35, Feb 1968. 5 tab, 6 ref.

Descriptors: *Drainage, *Drainage wells, *Soil texture, *Irrigation effects, *Design criteria, Irrigation, Groundwater, Recharge, Natural recharge, Water table, Water level, Aquifers, Discharge (Water), Salinity, Saline water, Evaporation, Consumptive use, Leaching, Seepage, Canals, Spatial distribution, Hydrology, Arid lands, Hydraulic conductivity.
Identifiers: *Pakistan, *Indus Plains, *Drainage factors, Irrigated agriculture, Horizontal drainage, Tubewell drainage, Leaching requirements.

In order for the cost of horizontal and tubewell drainage to be compared, drainage factors in the Indus Plains of West Pakistan had to be established for use as design criteria. The factors were calculated both from recharge estimates and from leaching requirements. The results of these two methods were compared and several types of drainage factors were distinguished. The researchers reached the following conclusions: (1) Recharge estimates yield higher drainage factors than leaching requirements. (2) Tubewell drainage will normally maintain a lower water table than horizontal drainage. (3) For tubewell drainage the factor derived from recharge estimates should be a criterion in establishing installed capacity. (4) In order to take account of seepage from line sources, a factor slightly higher than the one derived from leaching requirements should be used in calculating spacing of horizontal drainage. (5) If calculations result in wide drain spacings, the effect of intermittent recharge should be taken into account, especially in areas with any appreciable rainfall. (6) Accuracy required for drainage factors is limited and additional data collections should concentrate on hydraulic conductivity of the soil. (Carr-Arizona)

BRASKO V PRISLOVSKY (ACTION TO COMPEL THE REMOVAL OF A DAM PREVENTING DRAINAGE OF WATER FROM PLAINTIFF'S LAND).

183 SW2d 925-926 (Ark 1944).

Descriptors: *Arkansas, *Ditches, *Irrigation ditches, *Repulsion (Legal aspects), Surface irrigation, Channels, Drainage, Judicial decisions, Legal aspects, Surface drainage, Highways, Drainage systems, Drainage effects, Laterals, Surface waters, Water control, Riddance (Legal aspects), Culverts, Drains, Conduits, Surface runoff, Obstruction to flow, Relative rights, Flooding, Damages.

Plaintiff and defendant owned land on opposite sides of a highway running north and south, plaintiff on the west and defendant on the east. There were ditches on both sides of the highway, parallel therewith and designed to carry away excess surface water. Defendant's predecessor on the land had dug a ditch running eastward from the highway for irrigation purposes, and defendant dug another ditch running north and south along his west line, crossing the earlier east-west ditch at a right angle. This caused the obstruction of the east-west ditch. When obstructed water which previously had drained off plaintiff's land could no longer do so. Suit was brought to compel removal of the ditch which was causing the surface waters to back up on plaintiff's lands. The court held for the defendant, stating that a landowner may fend against the flow of surface water unless in so doing he unnecessarily or willfully damages another. There was no evidence that defendant had acted willfully, and he had every right to fend against the flow of waters over his land. (Barnett-Florida)

SIMULATION AND HYDROLOGIC RESPONSE OF A DRAINAGE NET OF A SMALL AGRICULTURAL DRAINAGE BASIN.
Uttar Pradesh Agricultural Univ., Naini Tal (India); and Illinois Univ, Urbana.
R. A. Rastogi, and B. A. Jones, Jr.
Transactions of the American Society of Agricultural Engineers, Vol 12, No 6, p 899-908, Nov-Dec 1969. 10 p, 22 fig, 7 tab, 14 ref.

Descriptors: *Drainage basins, *Watersheds (Basins), Simulation, Model studies, *Small watersheds, Streams, Streamflow, Overland flow, Routing, Surface runoff, Hydrology, Grid systems, Channel flow, Time lag, Slopes, Storm runoff, Inflow, Outflows, *Rainfall-runoff relationships, Mannings equation.
Identifiers: *Hydrologic models, Network analysis, Runoff hydrographs, Peak runoff.

An analysis was made of the morphologic relationships on 6 small upland drainage basins in Illinois. Regression lines were fitted to data, providing relationships of total number of streams and total stream length, highest stream order and total number of streams, length and number of different order streams, average channel slope and stream order, and channel bottom width and drainage area. These relationships were used to develop a model stream net for a 5-sq-mi basin with a drainage density of 14. The kinematic formulation for one-dimensional flow was used to route overland and channel flow through the drainage network of the basic third-order stream system of the model. The model was tested using different rainfall-excess durations and intensities to explore the linear and nonlinear relationships of the hydrologic process. (USBR)

FENMODE V AETNA CASUALTY AND SURETY CO OF HARTFORD, CONN (SURFACE WATERS DEFINED).

6 NW2d 479-481 (Mich 1942).

Descriptors: *Michigan, *Surface waters, *Flood damage, *Excessive precipitation, Judicial decisions, Ice, Snow, Legal aspects, Damages, Thunderstorms, Watercourses (Legal), Percolation, Evaporation, Drains, Pipes, Tides, Sewers, Rain, Discharge (Water), Ducts, Air conditioning, Leakage.

Plaintiff was the owner of a women's apparel store. Defendant was plaintiff's insurer on a water damage policy. Plaintiff's stock was damaged by reason of a heavy rainfall while being stored in plaintiff's basement. Plantiff's policy did not cover losses due to floods, inundation, backing up of sewers or drains, influx of tides, or rising surface waters. The source of the water was the determining factor for recovery. Plaintiff claimed the damage was caused by water entering through a defective air duct, back door, and a partly opened window. Defendant claimed the damage was caused by surface waters flowing under a defective door. The court found the weight of evidence indicated that the damage was caused by surface waters, and affirmed the trial court's judgement for defendant. The court stated that surface waters are waters on the surface of the ground, usually created by ice or snow, which are of a casual or vagrant nature. They follow no definite course and have no permanent existence. (Leesfield-Florida)

FLOOD PLAIN INFORMATION, COASTAL FLOODING OF NORFOLK, VIRGINIA.
Corps of Engineers, Norfolk, Va.

U S Army Corps of Engineers Flood Plain Report, March 1970. 40 p, 8 fig, 7 plate, 4 tab.

Descriptors: *Floods, *Flood damage, *Virginia, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood, Historic flood, Hurricanes.
Identifiers: *Norfolk (Va), Standard project flood, Intermediate regional flood.

Flooding of the coastal areas of Norfolk, Virginia is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. (Knapp-USGS)

MOUNTAIN BROOK ESTATES INC V SOLOMON (LIABILITY OF SUBDIVIDER, AS BETWEEN SUBDIVIDED LOTS SOLD, FOR DRAINAGE OVERFLOW).

23 So 2d 1-7 (Ala 1945).

Descriptors: *Alabama, *Community development, *Drainage, *Riddance (Legal aspects), Easements, Surface waters, Drainage systems, Drainage practices, Water control, Closed conduits, Control structures, Culverts, Outlets, Pipelines, Sewers, Cities, Legal aspects, Judicial decisions, Overflow, Land tenure, Real property, Relative rights, Ditches, Natural flow, Surface runoff.
Identifiers: *Servitudes.

Plaintiff servient estate owner sued the defendant corporation, the subdivider from whom he bought his property, for damages resulting from the overflow of a drainage ditch. The ditch serviced dominant estates and ran through an easement across the plaintiff's land. The lower court enjoined the defendant from allowing the overflow and required defendant to repair the drainage system. Plaintiff was also granted compensatory damages. The appellate court reversed, holding that the corporation's responsibility, to maintain the ditch it had constructed, passed to the grantees of the dominant estates at the time of such conveyances. The easement was appurtenant to and became a part of the dominant estates. Prior to said overflow, the subdivision had been incorporated into the city. The responsibility for the maintenance of the sewers then passed to the city. Moreover, the rules of law relating to the diversion of surface water were held inapplicable in that the defendant corporation, during such time as it was the owner of all the property in the subdivision, had a right to improve it, to destroy natural drains, and to provide other means for taking care of surface water thereon. (Price-Florida)

CITY OF PERU V CITY OF LA SALLE (RIGHT TO HAVE SURFACE WATERS NATURALLY DISCHARGED).

255 NE2d 502-507 (Ill Ct App 1970).

Descriptors: *Illinois, *Cities, *Drainage water, *Storm drains, Storm runoff, Prescriptive rights, Water rights, Surface runoff, Local governments, Legal aspects, Judicial decisions, Ravines, Natural streams, Watercourses (Legal), Drainage systems, Sewers, Outlets, Riddance (Legal aspects), Tile drains.

Plaintiff City of Peru sought an injunction to restrain defendant City of La Salle from draining water through a storm drain from the city limits of LaSalle into a ravine which ultimately drained onto property belonging to plaintiff. Plaintiff contended that in the absence of a natural watercourse draining the dominant land onto the servient land, defendant had no right to drain its land through the tile system onto plaintiff's land. Plaintiff also claimed a prescriptive right to be free from the drainage water since defendant's sewer system had drained water away from Peru for the past twenty years. The court denied the injunction stating that even in the absence of a natural watercourse, surface water may be drained into the same point of discharge where it would normally have found its way and the servient landowner cannot complain. The court also held that any prescriptive right that plaintiff asserted would be limited to the amount of water actually diverted by defendant and would not involve other surface water. Plaintiff failed to establish any such amount. (Hubener-Florida)

OLDENBORG V HYLEN (PROCEEDINGS FOR DRAINAGE SYSTEM TAKEN UNDER INAPPLICABLE STATUTE).
176 NW2d 78-81 (Minn 1970).

Descriptors: *Minnesota, *Drainage systems, *Legislation, *Local governments, State governments, Judicial decisions, Water law, Legal aspects, Ditches, Drainage programs, Administration, Water management (Applied), Drainage practices, Surface waters, Tiles, Drainage water, Surface runoff, Surface drainage, Assessments, Watercourses (Legal), Benefits, Real property.

Defendant county planned to improve a drainage area by constructing two ditches to drain lands previously drained only by a natural watercourse. The lands of the plaintiff, when drained only by the natural watercourse which flowed into an older drainage system had not been assessed for benefits. Plaintiffs contended that the upstream extension of the drainage ditches, into lands not previously assessed for benefits from construction of the existing drainage system, had been taken under proceedings prescribed by an inapplicable statute. The court held for plaintiffs stating that the county had proceeded under a statute which did not permit upstream extensions of such drainage ditches. The fact that the land to be benefited by the new project was not assessed for benefits in the original project required that the county follow procedures prescribed by another statute. (Hubener-Florida)

TIERNEY V EARL (ALTERATION OF FLOW OF SURFACE WATERS).
172 SE2d 558-561 (W Va 1970).

Descriptors: *West Virginia, *Grading, *Surface runoff, *Surface drainage, Water spreading, Overland flow, Soil erosion, Riddance (Legal aspects), Rain water, Flood damage, Land tenure, Landfills, Land use, Retaining walls, Land development, Land forming, Judicial decisions, Legal aspects, Relative rights, Alteration of flow, Obstruction to flow, Remedies, Damages.
Identifiers: Adjoining landowners.

Plaintiffs and defendant were adjoining home owners in a residential subdivision. One plaintiff alleged that the defendant, in grading his property, caused dirt to be piled on his side of the boundary line to a height of six to eight feet above the natural terrain. Defendant replied that excavations by the plaintiff in building his home had deprived defendant's property of lateral support and demanded relief. The other plaintiff, whose land also adjoined defendant's land, alleged that defendant had changed and raised the grade on another part of his lot so that the natural flow of surface waters on plaintiff's property was impeded. As a result, plaintiff suffered recurring flooding of his lot. The court held for both plaintiffs, and ruled that defendant was required to remove the dirt spilled on the first plaintiff's property. The court also ordered plaintiff to construct a retaining wall of sufficient height and strength to provide lateral support for defendant's property. Defendant was also ordered to remove the piled dirt which impeded the natural flow of surface waters from the other plaintiff's land. (Hubener-Florida)

ESCHETE V CITY OF NEW ORLEANS (FLOOD DAMAGES CAUSED BY INADEQUATE DRAINAGE SYSTEM).

231 So 2d 725-727 (La App 1970).

Descriptors: *Louisiana, *Cities, Drainage systems, *Storm runoff, Local governments, Storm drains, Urbanization, Utilities, Drainage water, Surface waters, Water control, Flood control, Precipitation (Atmospheric), Excessive precipitation, Rain, Storms, Flood damage, Damages, Judicial decisions, Adjudication procedure, Sewage systems, Construction.

Plaintiffs were homeowners in a subdivision area which, in times of heavy rainfall, experienced severe flooding due to defective and inadequate drainage systems. Plaintiffs alleged the city knew of the defects and failed to make improvements. Plaintiffs also alleged that, despite this knowledge, the city had authorized further construction of subdivisions in the area, thus greatly increasing the drainage problem. The court held the complaint insufficient since the city had no control over the drainage system and the flooding had occurred in the same area prior to authorization of further subdivision construction. The court pointed out that the co-defendant, the Sewerage and Water Board which controlled drainage systems, had the characterisitcs of a corporation, including the capacity to sue and be sued, and did not dismiss the suit against the Board. (Hubener-Florida)

BRADLEY V TEXACO, INC (DIVERSION OF SURFACE WATERS BY MEANS OF LANDFILL).
172 SE2d 87-90 (N C Ct App 1970).

Descriptors: *North Carolina, *Embankments, *Surface runoff, *Landfills, Land tenure, grading, Retaining walls, Slopes, Slope protection, Soils, Surface waters, Surface drainage, Riddance (Legal aspects), Judicial decisions, Legal aspects, Relative rights, Damages.

Plaintiff and defendant were adjoining landowners. Defendant oil company constructed a fill on its land to make it suitable for building a service station thereon. Plaintiff brought action for alleged damage to her property resulting from dirt, water and other debris washing down the embankment constructed by defendant. The lower court held for plaintiff. The appellate court acknowledged the principle that owners of land on a higher level cannot divert or interfere with the natural flow of surface water to the injury of servient owners without incurring liability. However, the court reversed and ordered a new trial since the lower court had refused to give permanent damages to plaintiff but had allowed testimony which constituted evidence of permanent damages in addition to testimony indicating amount of damages sustained by plaintiff up to the time of the trial. Since the evidence of permanent damage could have influenced the jury in assessing the amount of damage, the court ordered a new trial. (Hubener-Florida)

KEY SALES CO V SOUTH CAROLINA ELECTRIC AND GAS CO (DAMAGES CAUSED BY RELEASE OF WATER FROM DAM).
422 F2d 389-390 (4th Cir 1970).

Descriptors: *South Carolina, *Federal Power Act, *Dames, *Peak discharge, Hydroelectric plants, Damages, Water control, Water storage, Legislation, Electric power, Flood plains, Floods, Flood damage, Discharge (Water), Floodwater, Legal aspects, Judicial decisions, Relative rights, Water law, Riparian rights, Flooding, Flood protection, Land development, Excessive precipitation.

Plaintiff real estate developer sued defendant owner of hydroelectric dam when water released from the dam during a period of heavy rainfall caused damage to his lands. The court held for defendant ruling that plaintiff was not entitled to damages where the peak discharge of water from the dam did not exceed the peak flow of water into the dam during the storm. The court also found that the plaintiff developer's land lay in the flood plain of the river, had experienced flooding in previous years, and would have been flooded during the storm if the dam had not been in existence. The court also denied recovery for the damage under the Federal Power Act since the power company was not obligated by state law or federal license to operate its dam as a flood control facility for the benefit of lower riparian owners. (Hubener-Florida)
W70-08010

PETROVICH V UNITED STATES (SUIT FOR DAMAGES TO OYSTER BEDS ARISING FROM CHANNEL DREDGING).
421 F2d 1364-1370 (Ct Cl 1970).

Descriptors: *United States, *Louisiana, *Channels, *Dredging, Channel improvement, Excavation, Channel flow, Oysters, Commercial shellfish, Spoil banks, Damages, Silting, Silts, Sedimentation, Federal government, Remedies, Judicial decisions, Legal aspects, Erosion, Beds under water, Local governments, Engineering.

Plaintiff oyster growers brought action against the United States for damages to oyster beds caused by dredging of a channel. The dredging had taken place as a result of the Barataria Bay Waterway project authorized by Congress in 1958. Plans for the project, which included dredging by bucket dredge and construction of spoil banks, had been reviewed by state and local officials prior to commencement of the project, and the parish council and the state of Louisiana had executed assurances that the United States would be held harmless on liability claims for damages. As a result of the project, plaintiff's oyster beds suffered damage from increased silt accumulation. It was conceded that plaintiff was injured, so the measure of damages was the only remaining question. The United States Court of Claims applied a reasonable standard of damages on the ground that earlier oyster suits had shown actual damages impossible to determine. The collateral issue of the United States' attempted joinder of the local parish council was dismissed. (Barker-Florida)
W70-08013

THOMPSON V DYAR (CONSTRUCTION OF LEVEE ALONG CREEK CONTESTED BY LOWER RIPARIAN OWNER).
130 NE2d 52-54 (App Ct Ind 1955).

Descriptors: *Indiana, *Obstruction to flow, *Levees, *Natural flow, Natural watercourses, Riparian rights, Relative rights, Natural flow doctrine, Judicial decisions, Streambeds, Surface runoff, Streams, Dams, Damages, Floods, Proprietary power, Channels, Banks, Bank protection, Flooding, Repulsion (Legal aspects), Prescriptive rights, Remedies.
Identifiers: Injunctions (Mandatory).

Defendant constructed a levee extending one-quarter of a mile alongside a stream flowing through his property. Plaintiff, a lower riparian owner, sought an injunction requiring the defendant to remove the levee, alleging that it altered the natural course of the stream and caused an increase in the flow of water over plaintiff's lands. The circuit court entered judgment for defendant and the appellate court affirmed, stating that the levee had no effect on flowage of the creek water either in flood stage or low water stage. The court stated, as an analogy, that a lower proprietor may erect levees of reasonable height to prevent surface waters from entering his land, and he cannot be held liable for damages, if the obstruction causes water to flow on lands of another, unless the levee changes a natural or prescriptive course or channel. As there was no change in the course or amount of flow in the creek, the court refused to require removal of the levee. (Hubener-Florida)
W70-08020

TOWN OF HAMBURG V GERVASI (PRESCRIPTIVE EASEMENTS; SURFACE WATER).

55 NY S2d 876-878 (Sup Ct 1945).

Descriptors: *New York, *Prescriptive rights, *Surface drainage, *Easements, Natural flow doctrine, Adjudication procedure, Boundaries (Property), Community development, Drainage districts, Judicial decisions, Legal aspects, Land tenure, Local governments, Proprietary power, Public benefits, Repulsion (Legal aspects), Riddance (Legal aspects), Surface waters, Surface runoff, Relative rights, Remedies, Watercourses (Legal).
Identifiers: Injunctions.

Plaintiff city sought an injunction allowing it to enter defendant's land for the purpose of keeping open a watercourse and thus allowing for the free passage of drainage water. Plaintiff contended that from time immemorial surface waters had drained from upper lands across defendant's land, and the effect of such drainage had been to create a natural watercourse. In the alternative, plaintiff contended that it had acquired a prescriptive easement to drain surface waters across defendant's land. The court found the testimony insufficient to warrant the finding of a natural watercourse. Furthermore, the mere fact that surface water had always flowed from the land of the upper owner across defendant's land, without any other facts shown, would not give rise to a prescriptive easement. (Clarke-Florida)
W70-08022

FREIDEN V WESTERN BANK AND TRUST CO (SEWERS; PRESCRIPTIVE EASEMENTS).

50 NE2d 369-372 (Ohio Ct App 1943).

Descriptors: *Ohio, *Easements, *Sewers, *Prescriptive rights, Subsurface drains, Conduits, Legal aspects, Right-of-way, Drainage systems, Controlled drainage, Drainage water, Cities, Land tenure, Conveyance structures, Land use, Real property, Judicial decisions, Relative rights, Benefits, Beneficial use.
Identifiers: *Servitudes.

Plaintiff acquired a lot by deed of general warrantly from defendant bank. Plaintiff sued the bank and eight adjoining landowners to determine the status, rights, and duties of the parties with respect to a certain sewer, unmentioned in the deed, traversing all of said lots. All of the adjoining lots had at one time belonged to a common grantor who had constructed the sewer. The court found a sewer easement appurtenant to each lot and created by implication. The court held that implied grants of easement, although not favored, may be found on the basis of the following: (1) a severance of unity of ownership in an estate; (2) the use being shown to have been of a permanent nature before separation of ownership occurs; (3) the easement being reasonably necessary to beneficial engagement of the land granted; and (4) the servitude being continuous. The court further held that easements visible only on close inspection, such as underground drains, may pass by implied grant where the use is strictly necessary and the common owner intended the use to become appurtenant to the property benefited. (Hubener-Florida)
W70-08023

WILL V BOLER (OBSTRUCTION TO FLOW IN DRAINAGE DITCH CONSTRUCTED BY BOTH UPPER AND LOWER OWNERS).

4 NW2d 345-348 (Minn 1942).

Descriptors: *Minnesota, *Surface drainage, *Obstruction to flow, *Repulsion (Legal aspects), Runoff, Surface waters, Drainage, Surface runoff, Flow, Channels, Overflow, Land tenure, Ditches, Construction, Dams, Land, Maintenance, Damages, Benefits, Legal aspects, Judicial decisions, Landfill, Watercourses (Legal), Remedies, Relative rights.

Plaintiff upper landowner sought an injunction restraining defendant lower landowners from damming a ditch which aided the natural drainage of surface water from the area. The ditch had been constructed with contributions from predecessors in interest to the affected lands, including plaintiff's predecessor. Defendants filled part of the ditch, causing much of the surface runoff to overflow plaintiff's land. Plaintiff prevailed at the trial and defendants appealed on two grounds: (1) that evidence was insufficient to show a natural watercourse where the ditch ran; and (2) that evidence was insufficient to show plaintiff's predecessor contributed to the ditch's construction. The Minnesota supreme court affirmed the decision. The evidence supported both the finding that the ditch was constructed along a natural depression for surface drainage and that plaintiff's predecessor contributed to its construction. The Minnesota rule is that landowners may rid themselves of surface water but may not unreasonably or unnecessarily injure their neighbors in doing so. It is also the rule that where neighboring landowners unite to construct a drainage ditch to improve their holdings, each is estopped from closing the ditch in a way depriving others of the drainage. Defendants' acts

were unreasonable and injured plaintiff. A mandatory injunction restraining defendants was the proper remedy. (Duss-Florida)
W70-08024

LARSON V BUSSE (DRAINAGE SYSTEMS; EMINENT DOMAIN; COMPENSATION).
295 NW 47-53 (Minn 1940).

Descriptors: *Minnesota, *Eminent domain, *Drainage systems, *Local governments, Public benefits, Legal aspects, Judicial decisions, Surface waters, Riddance (Legal aspects), Streams, Tiles, Drains, Ditches, Outlets, Land tenure, Drainage effects, Compensation, Condemnation value, Riparian rights, Water law, Condemnation, Easements.
Identifiers: *Police power, Servitudes.

Defendant's land contained a slough which he wanted to drain in order to cultivate the ground. Defendant proceeded to construct a ditch to convey the water across the lands of the plaintiffs. The local township had authorized the construction under its drainage regulations and, by exercise of its eminent domain power, required subservient landowners (plaintiffs) to receive the drainage water. Plaintiffs sued for compensation. The court noted that under common law a landowner may direct surface waters onto adjoining lands as long as he does not cause unreasonable injury. However, under eminent domain powers, adversely affected landowners are entitled to compensation for all damages. The dissent stated that the township had exercised its police power in permitting the drainage, and benefiting the public thereby, and, therefore, no compensation was required. (Hubener-Florida)
W70-08030

GOODWIN V TEXAS CO (DUTY TO REMOVE CONTINUING NUISANCE).

185 A 695-696 (Me 1936).

Descriptors: *Maine, *Obstruction to flow, *Flood damage, *Abatement, Flooding, Damages, Watercourses (Legal), Flood control, Judicial decisions, Legal aspects, Remedies, Encroachment, Landfills, Regulation, Water injury, Construction.
Identifiers: *Nuisance (Continuing).

In former proceedings defendant corporation was found to have obstructed a natural watercourse in such a manner as to cause salt water and flooding damage to the lands and properties of plaintiffs. Plaintiffs were awarded damages as a result of such obstruction. However, the nuisance was not abated, and plaintiffs brought this action to recover further damages. Defendant maintained that plaintiffs' recovery in the prior suits represented the permanent damage and, therefore, this action could not be maintained. The court held successive suits could be brought for a nuisance where permanent damages cannot be ascertained. The general principle of law was stated that upon the creation of a nuisance, the creator may be legally compelled to remove it. For failing to so remove, defendant was found liable for damages resulting as of the date of filing suit in the prior suits up to the date of filing suit in the present action. (Finman-Florida)
W70-08032

WHEELER V TAYLOR (RIGHTS TO CONTINUED WATER FLOW).

39 A2d 190-193 (Vt 1944).

Descriptors: *Vermont, *Dams, *Easements, *Water use, Water supply, Water rights, Land use, Floodgates, Legal aspects, Judicial decisions, Mills, Saw mills, Mill dams, Riparian rights, Obstruction to flow, Alteration of flow, Relative rights, Remedies.

Defendant was the owner of a dam and flashboards on a pond upstream from plaintiff's saw mill. Plaintiff's grantor had owned both the mill and dam but had transferred only the former to plaintiff. The mill had burned down, and was inoperative at the time plaintiff purchased it. Defendant purchased the dam and surrounding land after plaintiff had rebuilt the mill and had resumed using the water as a source of power. Following a personal quarrel, defendant spiked the dam's flashboards in place and refused to allow the plaintiff access to the water. Plaintiff brought action to enjoin defendant's interference with this access. Plaintiff claimed that an implied easement had arisen from the deed of his grantor. The Supreme Court of Vermont pointed out that implied easements are created by reservation or grant and that only the latter might be applied to the instant case. The necessity of an easement was cited as an important but not determinitive factor. The court held that since the mill was inoperable at the time of plaintiff's grant, there was no need for the water and thus no grant of an easement to obtain it. The trial court's judgment for the defendant was affirmed. (Barker-Florida)
W70-08034

STROUGH V CONLEY (DIVERSION OF STREAMS--CONTRACT TO SUPPLY WATER).
164 Misc 248, 298 NYS 516-531 (Sp Ct 1937).

Descriptors: *New York, *Municipal water, *Supply contracts, *Water supply, Local governments, Water consumption, Water works, Water control, Utilities, Contracts, Legal aspects, Land tenure, Alteration of flow, Diversion, Riparian rights, Streamflow, Water utilization, Reservoirs, Water demand, Judicial decisions.

Plaintiff village had diverted streams into a reservoir for municipal use which previously flowed across the lands of defendants. The village agreed with defendants' predecessors in title to supply water to their premises. The supply to defendants was always inadequate and the village terminated the supply when it began to acquire its water from a nearby city. Plaintiff village brought this action to restrain defendants from interfering with the return of stream water to its original course and for a decree authorizing the plaintiff to abandon its objection and be relieved of any damages once the water was returned to its original course. In holding for defendants, the court ruled that the agreement with defendants' predecessors in title was a continuing obligation until defendants were restored to their original condition. Defendants held the same right as their predecessors and were entitled to damages for the previous inadequate service and for as long as the village diverted the stream water without supplying another source to defendants. However, damages for loss of revenue in defendant's dairy production were held to be based only on conjecture adn surmise and was not allowed. (Hubener-Florida)
W70-08037

CERA V CONSOL WATER POWER CO (FLOODING CAUSED BY RAISING OF DAM HEIGHT BEYOND AGREED LEVEL.
276 NW 124-126 (Wisc 1937).

Descriptors: *Wisconsin, *Dams, *Water levels, *Height, Flood damage, Overflow, Riparian rights, Damsites, Reservoirs, Dam construction, Barriers, Legal aspects, Judicial decision, Water law, Land use, Water storage, Water works, Utilities, Water sources, Relative rights, Contracts, Impoundments, Damages, Impounded waters.

Defendant maintained a dam across a river along which plaintiff owned land. Defendant and plaintiff reached an agreement by which defendant was allowed to flood a certain portion of plaintiff's land. Defendant subsequently raised the height of the dam 3 1/2 feet and plaintiff, in a suit for damages, contended that defendant had, by impounding more water, exceeded the extent of flooding permitted in the grant. The court, construing the agreement and a certain diagram recorded with it, found that the newly flooded land did not come within the original agreement and held for plaintiff. The plaintiff was entitled to damages equal to the difference in value of the land before and after the flooding caused by raising the dam. (Hubener-Florida)
W70-08039

KING V BROWN (DRAINAGE DITCH; PRESCRIPTIVE RIGHT).
298 Ky 485, 183 SW2d 490-492 (1944).

Descriptors: *Kentucky, *Ditches, *Easements, *Prescriptive rights, Drainage systems, Right-of-way, Legal aspects, Surface waters, Water control, Excavation, Trenches, Judicial decisions, Contracts, Benefits, Obstruction to flow, Remedies, Surface runoff, Runoff, Relative rights, Contracts, Real property, Excessive precipitation, Land tenure.

Plaintiff made a contract with an adjoining landowner authorizing construction of a ditch across the land of the adjoining owner. The ditch was constructed to carry off water which collected on plaintiff's lands and overflowed onto the adjoining land in times of heavy rainfall. Defendant, who purchased the adjoining land, filled in the ditch with rocks and debris and obstructed drainage flow, claiming that the ditch had not been constructed in accordance with the contract. Plaintiff sought an injunction ordering removal of the obstructions. The court held for the plaintiff stating that the existence and usage of the ditch for a period exceeding 10 years constituted compliance with the contract. Since defendant had been informed of the contract and the ditch before purchasing, he had knowledge of the easement right and could not complain of the insufficiency of the ditch. (Hubener-Florida)

HONEY V BERTIG (CASTING FLOOD WATER ON ADJACENT LANDS).
150 SW2d 214-216 (Ark 1941).

Descriptors: *Arkansas, *Drainage systems, *Overflow, *Relative rights, Ditches, Natural flow doctrine, Levees, Channels, Conduits, Structures, Conveyance structures, Controlled drainage, Judicial decisions, Legal aspects, Streams, Streamflow, Embankments, Alteration of flow, Drainage districts, Excessive precipitation, Floods, Floodwater, Damages.
Identifiers: Adjacent landowners, Scraper ditches.

Plaintiff and defendant were adjoining landowners in the same drainage district. A drainage ditch which tended to overflow in heavy rains, ran across their lands in a southeasterly direction. Plaintiff and defendant dug an additional scraper ditch to the south which ran across their lands and led into the drainage ditch. During floodwaters the drainage ditch overflowed into the scraper ditch. Defendant constructed a levee along the scraper ditch to prevent it from overflowing onto his lands to the south. Plaintiff sought an injunction for removal of the levee alleging that the levee cast the overflow waters onto his lands to the northwest. In holding for defendant the court acknowledged that a lower proprietor may not cast the waters of a natural stream upon lands of the upper proprietor to his injury. The court did not decide whether floodwaters constituted a natural stream or whether they were merely surface waters which could be thrown upon adjoining lands. However, the court did hold that the floodwater was a common enemy, and consequently defendant was entitled to protect his land unless, in doing so, he caused unnecessary injury to others. (Hubener-Florida)
W70-08042

JOHANNSEN V OTTO (DRAINAGE FLOW ACROSS ADJACENT LAND INCREASED BY

ARTIFICIAL DRAINAGE SYSTEM).

282 NW 334-336 (Iowa 1938).

Descriptors: *Iowa, *Drainage systems, *Surface drainage, *Natural flow, Drainage water, Drainage effects, Flood control, Overflow, Runoff, Surface waters, Surface runoff, Overland flow, Flow control, Water conveyance, Judicial decisions, Legal aspects, Water law, Tiles, Tile drainage, Construction, Relative rights, Damage, Routing.

Plaintiff owned a 100 acre tract of land on which, to expedite the natural flow of drainage water into a nearby creek, he constructed an artificial tile drainage system. Plaintiff sold 80 acres to defendant and retained a low-lying tract of 20 acres through which all the drainage water passed before entering the creek. Defendant permitted an adjoining landowner (second defendant) to construct a drainage system which tied into his own. Plaintiff sought damages and an injunction against the added flow, alleging that it caused his own system to overflow and damage the 20-acre tract. The court refused damages and the injunction on the basis of a state statute authorizing, as long as the system followed the natural course of drainage, construction of drainage systems to permit the collection and flow of water from one owner's land to another's. Here water flowing through the drainage system across plaintiff's land followed a natural course of flow. The court found the damage very slight, occurring only during heavy rainfall, and not attributable to the extra drainage. (Hubener-Florida)
W70-08043

WILLIS V PHILLIPS (SERVIENT ESTATE NOT ENTITLED TO HAVE CULVERT REMOVED TO PREVENT DRAINAGE ACROSS ITS LANDS).
5 So 2d 732-734 (Fla 1941).

Descriptors: *Florida, *Culverts, *Prescriptive rights, *Riddance (Legal aspects), Drainage water, Engineering structures, Overflow, Floods, Surface runoff, Drainage, Natural flow, Obstruction to flow, Remedies, Judicial decisions, Legal aspects, Ditches, Drainage effects, Routing, Flow control, Overland flow, Cities, Local governments, Roads.

Drainage water from a high area of land was collected in and flowed along a ditch paralleling a road. The water then flowed through a culvert maintained by defendant county commissioners and across lands of plaintiff into a pond. Plaintiff, alleging that the water flooded his land and damaged his crops, sought an injuction to require removal of the culvert. Plaintiff contended that for several years water had flowed in the ditch along the road without being directed across his land and that he had acquired a prescriptive right to have the water continue to flow only in the ditches along the road. The court, upon a finding that the natural course of flow was across plaintiff's land toward the pond, denied the request for the injunction. Drainage water cannot be prevented from following a natural course of flow. The court also found that the flooding on plaintiff's land was due to his attempts to obstruct the drainage flow, and that the flooding would be eliminated by construction of a ditch across his land. (Hubener-Florida)

LARE V YOUNG (DISCHARGE OF SURFACE WATER ONTO ADJOINING LAND).
53 Pa Super 28, 33 A2d 662-664 (1943).

Descriptors: *Pennsylvania, *Surface waters, *Surface drainage, *Surface runoff, Judicial decisions, Relative rights, Legal aspects, Natural flow doctrine, Easements, Natural flow, Cities, Runoff, Seepage, Obstruction to flow, Property values, Real property, Land tenure, Remedies, Reasonable use.

Plaintiff and defendant were owners of adjoining lots in a subdivision. Defendant's lot was of higher elevation than plaintiff's land. Plaintiff contended that the grading of defendant's lot and the construction of a driveway changed the natural contour of the lot and increased the normal volume of surface water flowing onto his property. Plaintiff sought an injunction and damages. In holding for defendant, the court stated that the owner of a lot in a city acquires land subject to the condition that existing surfaces are liable to be changed by the course of municipal development. An owner has a primary right to protect himself against the flow of surface water but may not collect and discharge surface water in a body and cause unnecessary injury. However, an owner may take reasonable measures to protect himself and incidental losses to neighbors are damnum absque injuria. The court found no evidence of a material diversion or increase of surface waters from defendant's property or any evidence of damage to plaintiff's property. (Hubener-Florida)
W70-08046

DARDENNE REALTY CO V ABEKEN (CONSTRUCTION OF DAM CONTESTED BY LOWER RIPARIAN OWNER).
106 SW2d 966-970 (St Louis Ct App Mo 1937).

Descriptors: *Missouri, *Diversion dams, *Natural streams, *Watercourses (Legal), Alteration of flow, Judicial decisions, Obstruction to flow, Diversion, Natural flow doctrine, Riparian rights, Relative rights, Dam construction, Flow control, Channel flow, Riparian land, Ditches, Rivers, Natural flow, Proprietary power, Lakes, Streams, Surface drainage, Prescriptive rights, Artificial watercourses, Impoundments.

Plaintiff was the owner of a large tract of land containing 2 lakes. The lakes were fed by a stream which also passed through defendants' land before entering plaintiff's land. The defendants constructed a dam across the stream to collect and divert the water into artificial lakes on their own land. Plaintiff sought an injunction against interference with the usual flow of water in the stream and for removal of the dam and closure of diversion ditches. Since the year of trial was particularly dry and there was little flow in the stream, it was necessary to determine whether the stream was a natural watercourse. The appellate court accepted the trial court's finding that, since the creek had a definite channel and its flow was not due only to surface drainage, the creek was a natural watercourse. The court also found that the action of a prior owner in raising one bank of the stream had not changed the stream into an artificial watercourse. Moreover, even if artificial, riparian rights could be acquired by prescription. The injunctions ordering removal of the dam and cessation of the diversions were affirmed. (Hubener-Florida)

TOWN OF BOONTON V STATE WATER POLICY COMM'N (REVIEW OF AGENCY DECISION CONCERNING DAM CONSTRUCTION).
122 NJL 34, 4 A2d 62-64 (1939).

Descriptors: *New Jersey, *Dams, *Reservoirs, *Administrative agencies, Permits, Administrative decisions, Cities, Public health, Water resources development, Structures, Damsites, Water storage, Water control, Water supply, Remedies, Judicial decisions, Legal aspects, Flooding, Water rights, Land use, Real property, Prescriptive rights, Swamps, Swimming, Flooding.

Plaintiff city sought review of defendant commission's decision granting a permit for a dam. The purpose of the dam, to be located on a stream which served as part of the municipal water supply, was to eliminate a swamp. Plaintiff alleged that creation of a reservoir in the designated location would endanger public health. It was also contended that defendant had improperly interfered with plaintiff's prescriptive right to flood the land of the party granted the permit. In dismissing the appeal, the Supreme Court of New Jersey pointed out the strict set of controls imposed by the commission to regulate the reservoir and foreclose the chance of pollution. Numbering eight in all, the conditions included swimming regulation, sewage safeguards, chlorination provisions, and various regulatory rights vested in the commission. The court held that the dam would ultimately result in a public benefit and that the commission's decision in no way effected property rights in the land where the reservoir would be situated. (Barker-Florida)

SMITH V ORBEN (INCREASED WATER FLOW IN STREAM).
182 A 153-156 (NJ Ch 1935).

Descriptors: *New Jersey, *Natural flow, *Drainage systems, *Relative rights, Riparian rights, Alteration of flow, Reasonable use, Water law, Flow, Streams, Upstream, Downstream, Drainage, Surface waters, Overflow, Drainage effects, Drainage engineering, Legal aspects, Remedies, Judicial decisions.

Plaintiffs, property owners, sought a mandatory injunction against defendant upstream property owner prohibiting the continued discharge of drain water into a stream which flowed through their properties. Defendant had developed his land so as to increase the accumulation of rain water and melted snow, and the discharge of these accumulations through a system of drainage so increased the flow of the stream that material damage was done to the properties of the downstream property owners. The court recognized the general rule that a property owner may collect surface water and discharge it into a natural water-course thereby increasing the volume and speed of the normal flow, but only to the point where the natural capacity of the stream is not exceeded so as to materially injure the lower reparian owner. It was held in the instant case that defendant had not acted within this general rule. The court did not issue the requested injunction, however, but rather instructed defendant that he should take immediate action to prevent further damage to plaintiff's property. (Barker-Florida)
W70-08052

COVELL V SIOUX CITY (EXCAVATION FOR CHANNELING OF STREAM AS AFFECTING LATERAL SUPPORT FOR ADJACENT LAND).
277 NW 447-451 (Iowa 1938).

Descriptors: *Iowa, *Percolating water, *Excavation, *Channeling, Groundwater, Groundwater movement, Reasonable use, Penetration, Underflow, Underseepage, Ditches, Streams, Land tenure, Land use, Real property, Water law, Judicial decisions, Legal aspects, Seepage, Banks, Embankments, Permeability, Structures.

Plaintiff and defendant were adjoining landowners. A natural stream ran through defendant's lot and defendant dug a new channel for it, excavating the ground to within several feet of plaintiff's lot. Plaintiff in a suit for damages claimed that the partial destruction of the lateral support for her property, due to the fact that water from the creek was enabled to percolate through the ground under her home, caused her house and sidewalks to settle and crack. The court stated that an adjoining landowner has the right to excavate up to boundary lines of adjoining territory, taking reasonable precautions to assure that adjoining soil does not fall from its own pressure. The excavating owner is liable if adjoining soil falls from its own pressure but is not liable if it falls due to the pressure of structures on the adjoining land. The court held that there was no evidence in support of the contention that water from the creek percolated under plaintiff's house. Therefore, the rule establishing the liability of a landowner who collects water and allows it to seep through the ground to the injury of adjoining landowner did not apply. (Hubener-Florida)
W70-08053

CARRABIS V BROOKLYN ASH REMOVAL CO (LIABILITY FOR DAMAGES RESULTING FROM SURFACE RUNOFF).
291 NYS 841 (App Div 1936).

Descriptors: *New York, *Surface runoff, *Relative rights, *Landfills, Storm runoff, Overland flow, Runoff, Environmental sanitation, Environmental engineering, Garbage dumps, Public health, Land forming, Sanitary engineering, Waste disposal, Land use, Flow, Surface waters, Surface drainage, Riddance (Legal aspects), Slopes, Rodents, Legal aspects, Judicial decisions.

Plaintiff and defendant were adjoining landowners. Defendant filled in lower land on his property with ashes and garbage so that his property was of greater height than plaintiff's land. As a result, water ran off defendant's property onto the premises of plaintiff in greatly increased quantities. Plaintiff brought this action for damages. In holding for defendant the court ruled that the filling-in operation was not an illegal act since it had not resulted in the creation of a defined watercourse or altered an existing one. Plaintiff was not entitled to damages for this particular cause although other nuisances created by defendant in the filling operation might warrant nominal or substantial damages. (Hubener-Florida)
W70-08054

TOWN OF BOONTON V FAY (TOWN SOUGHT TO HALT CONSTRUCTION OF DAM AND DEVELOPMENT OF ARTIFICIAL LAKE).
130 NJ Eq 55, 21 A2d 364-366 (1941).

Descriptors: *New Jersey, *Developed waters, *Land development, *Dams, Prescriptive rights, Reservoirs, Water pollution sources, Riparian rights, Public health, Public rights, Lakes, Impoundments, Watercourses (Legal), Potable water, Water quality control, Water utilization, Local governments, State governments, Permits, Administrative agencies, Regulation, Relative rights.
Identifiers: *Injunction (Prohibitory).

Plaintiff town sought to restrain defendant's construction of a dam. The purpose of the dam was to form a lake, following which defendant planned to develop the land around it. Plaintiff contended that: (1) the dam would create a source of pollution endangering the town's water supply; (2) the dam would diminish the flow of water into the town's reservoir; (3) the statute authorizing the permit was unconstitutional; (4) the dam would interfere with the prescriptive right of the town to overflow a portion of defendant's lands. The court, in determining whether a cause of action was stated, held that although potability of water was a primary consideration when the New Jersey Water Pollution Commission granted permits for dam construction, the issue of pollution had been decided in an earlier proceeding in favor of defendant. However, the issue of diminution of water supply had been previously heard and plaintiff could raise its common law right as a lower riparian owner. The constitutionality question had also not been raised previously and could be heard in the injunction proceeding. The alleged prescriptive rights of the town had not been raised in prior proceedings and the equity court had jurisdiction to consider those rights. (Hubener-Florida)
W70-08057

WHITCHER V STATE (RIGHT OF DAM OWNER TO CONTROL WATER LEVEL OF A POND).

181 A 549-556 (NH 1935).

Descriptors: *New Hampshire, *Impounded waters, *Riparian rights, *Mill dams, Ponds, Judicial decisions, Natural flow, Recreation, Reasonable use, Riparian land, Dam construction, High water mark, Water level fluctuations, Low water mark, Streamflow, Prescriptive rights, Water rights, Public benefits, Swimming, Fishing, Structures, Artificial use.

Defendants were owners of lots on the shore of a pond. Plaintiff owned a mill on the stream issuing from the pond. Plaintiff's predecessor in title had erected a dam on the pond and stream 70 years before, raising the water level of the pond 7 feet. Plaintiff reduced the water level of the pond in order to begin repairs on the dam, but defendants sought to restrain him. Plaintiff brought this action for determination of his rights. Defendants claimed that the plaintiff was only entitled to the natural flow over the dam and could not lower the water level by opening the gate in the dam. They also claimed a right by dedication to enjoy the artificial high water mark of the pond for swimming purposes. The court found that plaintiff had never intended to dedicate such a right and determined that plaintiff held a prescriptive right to use the flowage of the pond. The court further held that plaintiff was entitled to utilize the pond water down to the natural low water mark as long as the water was used as a source of power for his mill. However, the use could not be capricious or malicious with respect to interests in the pond of the riparian owners. Plaintiff could not be estopped from lowering the water level by the mere fact that cottages had been built around the pond during a period when the water was maintained at a high level. (Hubener-Florida)
W70-08062

TOWN OF PURCELLVILLE V POTTS (REASONABLE USE AND DIVERSION OF WATERS FROM A NATURAL STREAM).
19 SE2d 700-704 (Va 1942).

Descriptors: *Virginia, *Dams, *Alteration of flow, *Reasonable use, Obstruction of flow, Diversion, Judicial decisions, Legal aspects, Channels, Streams, Riparian rights, Riparian waters, Impoundments, Riparian land, Natural flow doctrine, Competing uses, Domestic water, Municipal water, Easements, Prescriptive rights, Relative rights, Discharge (Water), Diversion structures, Flow control, Eminent domain, Cities.

A spring-fed stream ran through plaintiff's land in a well-defined channel. Defendant city constructed dams on the stream above plaintiff's property, diverted the water from its natural channel and piped it into the city for the use of its inhabitants. Plaintiffs sought a mandatory injunction to abolish the dams and for damages for the diminution of the value of their property caused by defendant's actions. The court held that since both plaintiff and defendant were riparian owners, each had an equal right to the reasonable use of the water, but neither could diminish its quantity materially to the prejudice of lower proprietors. Defendant's diversion of the water beyond its riparian land was extraordinary and was not a reasonable use. Moreover, the use of the waters of a stream by a municipality is not a riparian right and a municipality can be held civilly liable for diverting waters and depriving lower riparian owners of the use thereof. However, the court here allowed the municipality to bring condemnation proceedings to obtain the riparian rights of plaintiffs to carry out their municipal purpose of obtaining a water supply for its inhabitants. (Barnett-Florida)

TACKETT V LINNENBRINK (RIGHT TO DIVERT SURFACE WATERS).
112 SW2d 160-164 (Ct App Mo 1938).

Descriptors: *Missouri, *Watercourses (Legal), *Diversion, *Repulsion (Legal aspects), Judicial decisions, Legal aspects, Natural streams, Alteration of flow, Diversion structures, Natural flow doctrine, Reasonable use, Relative rights, Riparian rights, Riddance (Legal aspects), Surface waters, Surface runoff, Drainage, Competing uses.

Plaintiff filed suit seeking damages for the alleged diversion of waters upon his land by defendant's negligent construction of a dam across an alleged watercourse that traversed their lands. Plaintiff contended there was a regular watercourse on his land with a definite channel having a bed and sides or banks. However, defendant argued that only surface waters that come upon this land passed across it and onto the adjoining land of plaintiff. From a trial court judgment for defendant, plaintiff appealed. The court stated that the general rule is that one may not divert or obstruct a watercourse so as to injure his neighbor's land. However, the court also stated that a dominant owner of land has a right to improve and protect his real estate by protecting it from surface water. Surface waters are a common enemy which every landowner may resist without liability. Since the question of whether or not certain water is surface water is a fact question for the jury, the court affirmed the trial courts judgment for defendant. (Barnett-Florida)
W70-08065

CLARK V PIERCE (RIGHT TO UNOBSTRUCTED NATURAL SURFACE DRAINAGE).
277 NW 711-712 (Iowa 1938).

Descriptors: *Iowa, *Surface drainage, *Surface runoff, *Obstruction to flow, Drainage systems, Drainage effects, Overflow, Runoff, Surface waters, Overland flow, Ditches, Routing, Flow control, Water conveyance, Natural flow, Artificial watercourses, Judicial decisions, Legal aspects, Alteration of flow.

Plaintiff and defendant were adjoining landowners. Plaintiff constructed a drainage system which directed surface waters across defendant's land. The system did not function effectively and plaintiff, without permission, entered defendant's land and dug a ditch to assist drainage flow. Defendant then placed railroad ties and fenceposts in the ditch. Plaintiff, in this action, sought an injunction to restrain defendant from interfering with the flow of water in the ditch. The court acknowledged that the owner of a dominant estate has the right to have surface waters accumulating on his land flow unobstructed in the natural course of drainage upon a servient estate. In holding for defendant, the court stated that the ditch was artificial and defendant was entitled to place the posts in it as long as he did not restrain the flow of water over his land more than it was impeded before the ditch was constructed. (Hubener-Florida)

DI NARDO V DO VIDIO (RIGHT OF DRAINAGE THROUGH ARTIFICIAL DITCH ON ANOTHER'S LAND).
45 NE2d 269-272 (Mass 1942).

Descriptors: *Massachusetts, *Ditches, *Obstruction to flow, *Natural flow, Spring waters, Alteration of flow, Relative rights, Springs, Discharge (Water), Streams, Judicial decisions, Legal aspects, Water law, Diversion, Flow control, Overflow, Drainage, Drainage practices, Watercourses (Legal), Prescriptive rights, Damages, Land tenure.
Identifiers: *Servitudes.

Plaintiff and defendant were adjoining landowners. Water from a spring on plaintiff's land flowed in a natural course through ditches running across the land of defendant and into a culvert. At an unknown time on defendant's land a newer ditch had been constructed which branched off the main course and carried water directly to the culvert, avoiding two right angle turns in the older course of flow. Water flowed through both branches before reaching the culvert. Defendant closed the newer ditch on his land causing water to rise on plaintiff's land since the old right-angled course did not provide sufficient drainage. Plaintiff sought damages and an injunction to open the newer ditch. The court refused to require the opening of the newer ditch, holding that the newer ditch did not constitute the normal course of flow of the water. A landowner cannot subject the land of another to a servitude of running water to which it is not naturally subject. The court also held that plaintiff had not acquired a right of drainage through the newer

ditch by adverse use. However, the court held plaintiff was entitled to have the older ditches cleaned and awarded plaintiff nominal damages. (Hubener-Florida)
W70-08075

STEED V KIMBROUGH (OVERTAXING OF LOWER OWNER'S DRAINAGE BY IMPROVEMENTS ON UPPER LANDS).
9 So 2d 925-927 (Miss 1944).

Descriptors: *Mississippi, *Surface runoff, *Repulsion (Legal aspects), *Riddance (Legal aspects), Surface waters, Flow augmentation, Alteration of flow, Diversion, Drainage, Drainage practices, Drainage systems, Flow control, Water control, Relative rights, Surface drainage, Rainfall - runoff relationships, Overland flow, Precipitation excess, Rain water, Ditches, Drainage effects, Natural flow, Judicial decisions, Legal aspects, Flooding.

Plaintiff and defendant were owners of adjoining land. Surface water naturally flowed from the defendant's unimproved upper land onto the plaintiff's lower land. The defendant constructed ditches through his upper lands and drained the surface water into a drainage ditch which the plaintiff had constructed along the common boundary. The accelerated flow and increased concentration of water overtaxed the plaintiff's ditch during heavy rains, and some water backed up onto the defendant's property. To force the plaintiff to improve his ditch, the defendant cut into the ditch and caused periodic flooding of the plaintiff's land. The plaintiff sought to enjoin the defendant, and the court held that the lower land owner, while ridding himself of naturally accumulated surface water, cannot use the upper land or cause water to back up in amounts greater than would be on the upper owner's property under natural conditions. However, neither can the upper owner create conditions, as was here done, which increase the flow onto the lower owner's land beyond that amount which would naturally flow thereon. If the upper owner creates such a situation, he must take care of the excess flowing back onto his property. (Price-Florida)
W70-08079

HALL V STATE (RIGHT TO DAMAGES FOR CASTING COLLECTED SURFACE WATER ONTO ADJOINING LAND).
33 NYS2d 1006-1007 (Ct Cl 1942).

Descriptors: *New York, *Surface runoff, *Riddance (Legal aspects), *Landfills, Drainage water, Concrete structures, Surface drainage, Rainwater, Earthworks, Land forming, Drains, Diversion structures, Diversion, Legal aspects, State governments, Land use, Alteration of flow, Real property, Damages, Relative rights, Impounded waters, Obstruction to flow, Remedies.

Plaintiff and the defendant state were adjoining landowners. Plaintiff placed fill upon a part of his land and also upon a part of the state's land. This fill caused the diversion of water after it left the end of a concrete gutter located on defendant's land. Without such fill water would have run from the gutter over state lands, passing plaintiff's property, and into a brook. Plaintiff sought damages for the diversion of water from the state lands to his property. The court acknowledged the rule that a landowner is entitled to recover where an adjoining owner collects surface waters and casts them upon his neighbor's property. However, the court held that here it was plaintiff's own action in placing the fill that caused the water to run from state land to plaintiff's land. (Hubener-Florida)
W70-08081

WRIGHT V CITY OF ONEONTA (MUNICIPAL LIABILITY FOR DAMAGES CAUSED BY OVERFLOWING STREAM).
165 Misc 492, 1 NYS2d 295-300 (Sup Ct 1937).

Descriptors: *New York, *Flood damage, *Excessive precipitation, *Alteration of flow, Local governments, Adjudication procedure, Judicial decisions, Legal aspects, Relative rights, Riparian land, Riparian rights, Riparian waters, Usufructuary right, Watercourses (Legal), Flood control, Dams, Flashfloods, Overflow, Cloudbursts, Rainfall, Floods, Intensity, Maximum probable flood, Diversion, Swimming pools.

A stream, to which the city had the water rights for the purpose of supplying the city residents, flowed through defendant city. During a particularly severe rainstorm, the stream overflowed its banks and the overflow damaged plaintiff's buildings and property. Plaintiff sued the city on the grounds that the city was obligated to maintain the stream within its banks and that, in altering the channel of the stream, defendant had failed to protect the rights of lower landowners. Evidence showed that defendant had for a short distance diverted the waters out of the natural channel in order to form a swimming pool. The water was then diverted back into the channel. The court held that a municipality through which a stream flows has no duty to keep it in a safe condition or free from obstruction not of its own causing, nor is it liable for damages from increased flow of surface water so long as the water is not diverted from its natural course. In this case the evidence did not warrant a finding that defendant had changed or increased the hazard from the stream in question. The conditions which caused the flood were unusual, extraordinary and unforeseeable. (Clarke-Florida)
W70-08083

WHITMAN V FORNEY (OBSTRUCTION OF DRAINAGE PIPE WHICH REPLACED DITCH).
31 A2d 630-634 (Md 1943).

Descriptors: *Maryland, *Pipes, *Easements, *Riddance (Legal aspects), Reasonable use, Highways, Administrative agencies, Drainage practices, Outlets, Subsurface drainage, Ditches, Drainage engineering, Open channels, Judicial decisions, Legal aspects, Repulsion (Legal aspects), Surface runoff, Clay pipes, Pipelines, Drainage water, Obstruction to flow, Prescriptive rights, Repairing, Roads, Relative rights, Natural flow.

Defendants blocked off a ditch carrying surface waters from a state road across their land. Plaintiff state road commission acquiesced in the filling of the ditch since a pipeline replaced the ditch as the means of drainage. The pipeline later broke and obstructed drainage from plaintiff's road. Plaintiff brought suit to enjoin defendants' obstruction to the drainage and to require defendants to restore the drainpipe to its original condition. The court held that the owner of upper land has a right to the uninterrupted flowage of water, and the proprietor of lower land, to which the water naturally descends, has no right to obstruct such flowage. The right to flowage exists without regard to a prescriptive easement. However, the court found that although plaintiffs were entitled to flowage over defendants' land, since plaintiff had acquiesced in the filling of the ditch with a pipeline, plaintiff was not entitled to compel defendants to maintain the line at their own expense. Plaintiff was entitled only to go upon defendants' land to repair the drain. (Barnett-Florida)
W70-08087

DARR V CAROLINA ALUMINUM CO (DAMAGE TO LAND AND CROPS RESULTING FROM OBSTRUCTION OF DRAINAGE FLOW).
3 SE2d 434-437 (NC 1939).

Descriptors: *North Carolina, *Drainage, *Watercourses (Legal), *Riddance (Legal aspects), Open channels, Judicial decisions, Legal aspects, Easements, Surface drainage, Ditches, Surface waters, Ponding, Dams, Channels, Prescriptive rights, Streams, Rivers, Banks, Trenches, Discharge (Water), Artificial watercourses, Surface runoff, Obstruction to flow, Silting.

Plaintiffs brought an action against defendant for the recovery of damages to land and crops. Plaintiffs alleged that defendant's negligent construction of a dam across the Yadkin River above plaintiffs' lands had caused the channel of the river to be filled with sand, debris and vegetation. This in turn caused its tributary streams that flowed over plaintiffs' lands to be obstructed. These obstructions allegedly prohibited the natural flow into the tributaries of drainage waters from a ditch on plaintiffs' lands. The court held that evidence failed to show that the obstructed ditch was a natural watercourse, defined as a ditch consisting of banks, beds and water while in a state of nature without artificial construction. Without such a showing plaintiffs did not have the legal right to collect the water on their land and discharge it through such ditch over the lands of defendant. The fact that plaintiffs had no other means of discharge did not give them such a right. Also, under the laws of North Carolina, the permissive use of the ditch for thirty years did not give plaintiffs an easement to continue such use. (Barnett-Florida)
W70-08090

LOUISVILLE AND NASHVILLE RR V CAPDEPON (DUTY TO REMOVE OBSTRUCTION TO NATURAL FLOW OF SURFACE WATERS).
4 So 2d 544-546 (Miss 1941).

Descriptors: *Mississippi, *Obstruction to flow, *Ditches, *Drainage, Construction, Damages, Surface waters, Slopes, Railroads, Drainage effects, Drainage engineering, Drainage patterns (Geologic), Drainage practices, Drainage systems, Drainage water, Legal aspects, Judicial decisions, Flow, Flow control, Flow resistance, Natural flow, Maintenance, Repairing.

Defendant railroad company constructed a railroad and a ditch adjacent to plaintiff's lot. The ditch was constructed to carry surface waters from plaintiff's lot since the railroad obstructed the natural flow of drainage. When the ditch was kept clear and free of debris, it would properly drain the water from plaintiff's land. However, the ditch became clogged by grass, tree tops and other debris. As a result, water backed up onto plaintiff's property. Defendant made no attempt to remove the obstructions. Plaintiff brought action for damages to his lot and the improvements thereon which resulted from this flooding. The court held that defendant not only had the duty to properly construct the ditch but also to properly maintain it so as not to obstruct the natural flow of surface waters from plaintiff's land. Consequently, defendant was liable for any damages incurred by plaintiff as a result of such obstruction. (Finman-Florida)

TOWN OF YORK V MCALPIN (DUTY TO DISCONTINUE WRONGFUL DIVERSION OF WATER).
2 Div 70, 167 So 539 (Ala 1936).

Descriptors: *Alabama, *Local governments, *Overflow, *Diversion structures, Surface drainage, Structures, Judicial decisions, Legal aspects, Remedies, Abatement, Flow control, Surface waters, Drainage systems, Damages, Watershed management, Regulation, Regulated flow, Standards, Design standards, Management, Culverts, Alteration of flow, Diversion.
Identifiers: *Nuisance, Injunction (Prohibitory).

Plaintiff private landowner brought action against defendant municipality for an injunction, damages, and the abatement of a nuisance caused by defendant's construction of pipes or culverts so that they caused surface waters to be wrongfully diverted and to overflow onto plaintiff's property. The court found that the manner in which the culverts were installed and maintained caused plaintiff's damages. Therefore, the court rendered judgement for plaintiff for the abatement of the nuisance and for damages. The injunction was granted as a necessary protection to plaintiff against the constant or frequently recurring injuries due to the

wrongful diversion of surface waters. The court found that damages alone could not provide an adequate remedy because of the nature of plaintiff's injury. (Clarke-Florida)

Agricultural Waste Management Conference, Cornell University, Typescript, January 1970. 19 p, 32 ref.

Descriptors: *Artificial recharge, *Groundwater, *Groundwater recharge, *Ecology, *Water pollution, Waste water disposal, Aquifers, Water supply, Water management (Applied), Water spreading, Pit recharge, Recharge wells, Balance of nature, Environment, Environmental effects.

The authors describe the methods of artificial groundwater recharge and raise the question of whether artificial recharge contaminates groundwater. They feel that no clearcut answer is available, but they hope to stimulate research and evaluation on planned and operational artificial recharge installations. In the past, severe groundwater contamination has generally been localized. However, the potential for widespread contamination is quite real and the authors fear it may already be occurring. Any damage may upset the total ecological system of the universe by the phenomena of biological amplification. Augmentation of the water supply by artificial recharge should not be considered so important as to openly invite the use of contaminated recharge water. (Carr - Arizona)

VANDERBILT V STATE (DESTRUCTION OF WELL'S WATER SUPPLY).

159 Misc 586, 288 NYS 544-545 (Ct Cl 1936).

Descriptors: *New York, *Subsurface waters, *Road construction, *Water wells, Wells, Underground streams, Underground, Groundwater, Relative rights, Springs, Subsurface investigations, Excavation, Civil engineering, Construction, Soil mechanics, Highways, Highway effects, Judicial decisions, Legal aspects.

Defendant state, in the construction of a highway, cut through a subterranean stream and rendered useless the well of plaintiff who owned land adjacent to the construction site. Plaintiff sought compensation for the taking of private property and damages. The court found that the highway was constructed in conformity with usual plans, specifications, and accepted engineering methods and the state had had no knowledge of the existence of the subterranean stream. The court held that since no property of plaintiff had been taken, he was not entitled to any damages in the absence of negligence or knowledge of the stream's existence. (Hubener-Florida)

4C. Effects on Water of Man's Non-Water Activities

EFFECT OF URBANIZATION ON STORM WATER PEAK FLOWS,
Pedro C. C. Da Costa.
ASCE Proceedings, Journal of the Sanitary Engineering Division, Vol 96, No SA 2, Paper 7198, p 187-193, April 1970. 7 p, 1 fig, 3 ref, append.

Descriptors: *Rainfall-runoff relationships, *Urbanization, *Storm runoff, *Peak discharge, Hydrograph analysis, Rational formula, Drainage, Precipitation intensity, Watersheds (Basins), Frequency analysis, Storm drains, Time of concentration.
Identifiers: Urban watersheds.

Urbanization of a natural watershed modifies the original shape and proportions of the hydrograph that may be considered representative of the natural watershed. The unique runoff coefficient of the rational formula is, in fact, the product of three factors, each one having some correlation with the degree of urbanization given to the watershed. The influence of urbanization is mainly expressed by the degree of imperviousness and the degree of artificial canalization given to the watershed. The presented general rational formula is related to other rainfall-runoff relationships derived by Snyder and by Horner-Flynt. Results from the formula are compared with these obtainable by the Chicago Method. The concepts presented must be considered as one way of demonstrating the relationship between rainfall and runoff in areas which are urbanized or not, rather than a completely developed and tested method of calculating storm water peak flows. (Knapp-USGS)

A HYDROMETEOROLOGICAL STUDY RELATED TO THE DISTRIBUTION OF PRECIPITATION AND RUNOFF OVER SMALL DRAINAGE BASINS - URBAN VERSUS RURAL AREAS,
Texas A and M Univ., College Station. Water Resources Inst.
Robert G. Feddes, Robert A. Clark, and R. C. Runnels.
Available from the Clearinghouse as PB-192 635, $3.00 in paper copy, $0.65 in microfiche. Technical Report No. 28, June 1970. 64 p, 5 tab, 27 fig, 20 ref. OWRR Project A-010-TEX (1).

Descriptors: *Rainfall-runoff relationships, Surface runoff, Rainfall, *Urbanization, Precipitation (Atmospheric), Texas, *Streamflow, *Watersheds (Basins), Hydrograph analysis, Meteorology.
Identifiers: Bryan (Tex).

The effects of urbanization on streamflow are investigated for two adjacent similar watersheds located in and near Bryan, Texas. The Burton Creek watershed is 84 per cent urbanized and the Hudson Creek watershed is completely rural. Storms observed within each basin are used for comparison of pertinent hydrograph parameters. Simultaneous events are compared between the watersheds and the urbanization effect noted. A synthetic procedure for predicting hydrographs on both watersheds is developed. Reproduction of actual events indicates better results in the rural watershed. There is conclusive evidence that the urbanization of a watershed decreases time-to-peak and increases the peak discharge.

Descriptors: *Storm runoff, *Flood routing, *Flood control, *Synthetic hydrology, *Urbanization, *Planning, Design flood, Headwaters, Computer programs, Floodways, Reservoir operation, Grassed waterways, Water management (Applied), Watershed protect, Flood prevent.
Identifiers: Return period, *Urban hydrology, Downstream hydrograph, Grassed valley bottoms, Blue and green concept.

Four synthetic hydrograph methods were applied on five watersheds in hopes of simplifying planning decisions for reserved space in valley bottoms of suburbia headwaters. Both hydrograph and routing procedures were programmed for digital computer evaluation for the more than 300 cases considered. General conclusions include the following. (1) No simple rules can be given on width of floodways to planners. Each case must be individually investigated. (2) Computer methods greatly facilitate routing and synthetic hydrograph computations. (3) Generalizations are impossible because interactions occur between the method used, the return period, and the percentage of the watershed above the reservoir among others. (4) A great need exists for data-based methods for predicting suburban design hydrographs in ungaged situations. (5) A new course on urban hydrology was developed from the studies results. The course is designed to teach hydrologists the modern techniques which are being developed to solve this set of urban problems. (Sink-Penn State Univ)

REPUBLIC STEEL CORP V STRACNER (DAMAGE TO WELLS CAUSED BY MINING OPERATIONS).

21 So 2d 690-693 (Ala 1945).

Descriptors: *Alabama, *Mining, *Overlying proprietor, *Damages, Adjudication procedure, Boundaries (Property), Judicial decisions, Land tenure, Leases, Legal aspects, Proprietary power, Relative rights, Groundwater, Remedies, Drainage effects, Wells.
Identifiers: *Mineral rights.

Defendant corporation owned mineral rights to land adjoining and under plaintiff's property. Evidence indicated that defendant had operated mines under plaintiff's property and that, in retreating from such mines, defendant had removed pillars supporting the roof of the mines. As a result, the land superjacent to the mine shafts caved in, causing a nearby percolating well on plaintiff's land to dry up. Plaintiff sued for loss of property value. The court held that miners are strictly liable for damages caused by disturbances of land from mining operations. A miner, however, is not liable for incidental damages necessarily occasioned by ordinary and careful operation of a mine, and not injurious to the surface, such as the loss of wells by the superjacent owner. But if such wells are willfully or negligently drained without reasonable need to do so, causing damage to the surface owner, there is a cause of action. The court held that defendant's failure to properly support the abandoned mine shafts constituted such a cause of action, and affirmed the trial court's judgement for plaintiff. (Clark-Florida)

RECENT STUDIES OF URBAN EFFECTS ON PRECIPITATION IN THE UNITED STATES,
Illinois State Water Survey, Urbana.
Stanley A. Changnon, Jr.
American Meteorological Society Bulletin, Vol. 50, No. 6, p 411-421, June 1969. 2 fig, 4 tab, 39 ref.

Descriptors: *Precipitation (Atmospheric), *Cities, *Climatology, Thunderstorms, Hail, Thermal pollution, Rain gages, Frequency, Snowfall, Condensation, Orography.
Identifiers: *Urban-induced nuclei.

Very little research has been conducted dealing with urban effects on precipitation. However, the few studies which have been conducted reveal from 5 to 16% increases in precipitation and from 7 to 30% increases in summer thunderstorm days in urban areas. Even greater increases in precipitation have been observed downwind from major steel mill complexes. These changes have been credited to urban-induced nuclei concentrations and urban thermal effects. The results of the urban studies may indicate the effectiveness of ground-based seeding, the possibility of successful increases in all seasons, the likelihood of thunderstorm and hailstorm increases with rainfall increases, and the need for dense raingage networks to adequately determine the area and amount of increase. 05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification of Pollutants

RESEARCH NEEDS ON THERMAL AND SEDIMENTARY POLLUTION IN TIDAL WATERS,
V. D. Masch.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY7, Paper 7426, p 1539-1548, July 1970. 10 p, 7 ref.

Descriptors: *Tidal waters, *Estuaries, *Water pollution effects, *Water pollution sources, *Research facilities, Water temperature, Water pollution, Tidal effects, Sediments, Hydraulics.
Identifiers: *Research needs, *Estuarine pollution, Tidewater.

When requested to identify the most pressing research need in its field, the ASCE Tidal Hydraulics Committee quickly arrived at the consensus opinion that thermal and sedimentary pollution of tidal water bodies was the major problem. Over a period of a year valuable ideas and suggestions have been obtained from all committee members. Sedimentary and thermal pollution problems in tidal water are described and the literature and some related research are reviewed. General and specific research needs in both thermal and sedimentary pollution, as well as instrumentation, are outlined. (Knapp-USGS)

FALLOUT AND CLIMATE STUDIES ON FIRN CORES FROM CARREFOUR, GREENLAND,
Innsbruck Univ. (Austria); and Copenhagen Univ. (Denmark). H. C. Orsted Inst.
W. Ambach, and W. Dansgaard.
Earth and Planetary Science Letters, Vol 8, No 4, p 311-316, May 1970. 6 p, 3 fig, 1 tab, 16 ref.

Descriptors: *Fallout, *Glaciers, *Tracers, *Tritium, *Profiles, Climatology, Tracking techniques, Regimen, Arctic, Stable isotopes, Radioisotopes.
Identifiers: Greenland, Oxygen isotopes.

To compare detailed, vertical gross beta-activity and tritium profiles in a high polar glacier with a temporal record of fallout of fission products at high latitudes, to compare the annual net accumulation data that might be derived from the radioactivity and stable isotope profiles, and to estimate the recent climatic development on the mid-Greenland ice sheet, two snow and firn cores, 20 meters apart, were hand augered at Station Carrefour on the Greenland ice sheet. Only little summer melting and no runoff occur in the area. Both of the ice cores were cut into 10-15 cm long increments. The longer core, representing the upper 20 m, was analyzed for gross beta-activity and oxygen isotope ratios; the short core, reaching from 1 to 10 m below surface, was analyzed for tritium and oxygen isotopes. None of the beta-activity and O-18 profiles is quite sufficient for establishing a reliable isotopic identification of recent annual snow layers at Carrefour. However, such identification can be obtained in the period 1953-65 by comparing the two profiles mentioned, or by comparing the beta-activity profile with exactly dated fall-out data from nearby stations. The use of the beta-activity measurements is limited to strata formed since 1953. (Knapp-USGS)

5B. Sources of Pollution

GOOD HOUSEKEEPING IS BEST SOLUTION TO STREAM POLLUTION,
Massachusetts Inst. of Tech., Cambridge.
R. E. McKinney.
American Textile Reporter, Vol 71, p 71-74, 1957.

Descriptors: *Water pollution, *Waste waters, *Pollution sources, *Water pollution effect, Waste waters, Water conservation, Test procedures, Inorganic waste.
Identifiers: *Process chemicals, *Effluent treatment, Waste water analysis, Absorption capacity (Stream).

The textile industry contributes to three basic types of pollution: (1) materials having a high oxygen demand, (2) inorganic matter, and (3) color. The major textile waste problem results from the organic fractions in their process wastes. Greater emphasis is needed on water conservation and water pollution; the textile industry must become concerned with these problems. Although few mills have the properly trained personnel and/or proper equipment, if plant managers will consider carefully the following 10 specific areas, water can be more readily conserved and pollution can be better controlled: (1) The pollution absorption capacity of the stream. (2) Sources of pollution within mill. (3) Volume of water used and pollutional characteristics. (4) Good housekeeping reduces pollution to minimum. (5) Process changes or process chemical changes. (6) Waste treatment is last resort. (7) Chemical treatment for colloidal or suspended pollution. (8) Biological treatment for soluble wastes. (9) Evaluation of each type of treatment. (10) Separate treatment verses combined treatment. The proper consideration of each of these steps will result in the most economic solution to textile mill waste treatment problems. GROUNDWATER CONTAMINATION,
Guelph Univ. (Ontario). Dept. of Soil Science.
Robert W. Gillham, and L. R. Webber.
Water and Pollution Control, Vol 106, No 5, p 54-57, May 1968. 5 fig, 1 tab, 11 ref.

Descriptors: *Groundwater, *Piezometry, *Water table, *Surface-groundwater relationships, *Water pollution sources, Infiltration, Wastes, Hydraulic conductivity, Subsurface drainage, Transmissivity, Head loss, Darcys law, Time lag, Nitrogen compounds, Nitrates, Discharge measurement, Discharge (Water), On-site data collections, Underflow.
Identifiers: *Hydraulic potential, Canada.

All inorganic salts of N are very soluble in water and N in the nitrate form is particularly hazardous for both humans and livestock. Barnyards and feedlots may be prime sources of inorganic N in groundwater. A piezometric network was installed radially throughout a barnyard for determination of groundwater discharge out of the barnyard so that it could be correlated with the changes in the N concentration of the water as it passed beneath the barnyard. The active head of water in a given piezometer was measured at different times. Its basic time lag, together with the geometry of the piezometer, could be used to calculate hydraulic conductivities from a large number of sites. These were then used to construct a map of isopotential lines indicating changes in hydraulic potential with distance. A simplifying assumption was that hydraulic potential did not vary vertically in the

water table to bedrock. Together with N measurements at various depths to bedrock, the results showed that the barnyard contributed 0.00189 lb N/hr to the groundwater, or about 17.5 lb N/yr. This was considered surprisingly low, since the manure of a single cow could produce 74 lb N/yr. (Casey-Arizona)

SWAP CHEMICALS FOR CLEANER STREAMS,
Wesleyan Univ., Middletown, Conn.
N. W. Masselli, and M. G. Burford.
Textile Industries, Vol. 125, No. 2, p120-144, 1961. 13 ref.

Descriptors: Pollution source, *Biochemical Oxygen Demand, *Waste water treatment.
Identifiers: *Cotton processing wastes, *Wool processing, Chemical replacement, *Waste water analysis.

The article is in two parts; one dealing with cotton processing and stream pollution, and the other with wool processing and stream pollution. Since all cotton cloth processed by mills must be desired, the desizing process is shown to contribute approximately 70% of the total BOD of a mill. Because BOD is a pollution problem, the replacement of the high BOD process chemicals to reduce pollution is feasible. From the data presented it is clear that high BOD starch must be replaced. When dealing with the wool processing, only the scouring, dyeing, and wash after fulling are of interest, since liquid discharges are produced only in these processes. Any pollution reduction plan for scouring and finishing mills must involve the scouring and wash after fulling wastes, since they produce about 89% of the total plant BOD. In order to obtain a complete picture of the actual BOD sources in the wool effluent, the chemical nature of the discharged compounds must be determined. (Rhine-North Carolina State)

NUMERICAL ANALYSIS OF DISTRIBUTION OF FLOW AND THERMAL DIFFUSION CAUSED BY OUTFALL OF COOLING WATER,
Central Research Inst. of Electric Power Industry, Tokyo (Japan).
Akira Wada.
13th Congress of the International Association for Hydraulic Research, 31 Aug - 5 Sept, 1969, Proc. Vol 3, Subject C, p 335-342. 11 fig.

Descriptors: *Thermal diffusion, *Coding water, Numerical analysis, Temperature, Numerical model, Richardson number, *Flow.
Identifiers: *Entrainment.

The problem of flow and thermal diffusion in the sea caused by outfall of warmed cooling water is considered. Theoretical studies and model investigations have been made on the conditions under which entrainment occurs in a two layer flow. Ellison and Turner defined the equations of continuity of mass deficiency A and for entrainment coefficient E. Experimental results show that entrainment occurs for the condition of the interfacial gradient exceeding 0.04. The numerical experiment is conducted for the model of a simple semi infinite sea basin with a two layer system. This model contains seven nonlinear partial differential equations. Attention is confined to the time-dependent response of a two-layer sea. The result shows that the decrease of the temperature of discharged warm water is not only due to the entrainment from lower layer, the horizontal mixing with the surrounding water and the heat emission to the atmosphere, but also due to the entrainment of surface water along the coastal line into the main flow. SYMPOSIUM ON WASTE-DISPOSAL PROBLEMS OF SOUTHERN MILLS,
American Association of Textile Chemists and Colorists, Durham, N.C.
R. Hobart Souther.
American Dyestuff Reporter, Vol 44, No 12, p 379-400, 1955. 9 ref, 3 fig, 22 tab.

Descriptors: *Biological treatment, Waste water treatment, Waste water disposal.
Identifiers: *Slashing, *Sizing, *Bleaching wastes, *Dyehouse wastes, *Recovery (Waste), *Caustic soda, Textile mill wastes, Bleaching.

The papers, deal with problems of stream pollution from textile processing. Two types of research are required in solving waste-disposal problems: (1) local research and (2) research that is applicable generally. Five of the eleven papers described specific pollution control techniques: cotton slashing with synthetic compounds, bleaching and dyehouse waste studies; textile waste treatment in Texas; biological treatment of highly alkaline wastes; pollution control by recovery of caustic soda. The other six papers deal with stream classification, national waste studies, and federal pollution laws. (Sheffield-North Carolina State Univ)

EFFICACY OF METHYLPENTYNOL AS AN ANESTHETIC ON FOUR SALMONIDS,
Bureau of Sport Fisheries and Wildlife, LaCrosse, Wis. Fish Control Lab.
Robert M. Howland, and Richard A. Schoettger.
Investigations in Fish Control, No 29, 1969. 10 p, 1 fig, 5 tab, 19 ref.

Descriptors: *Fish physiology, Rainbow trout, Brown trout, Brook trout, Lake trout, Water temperature, *Fish behavior, Fish management, *Evaluation, Laboratory tests, Equilibrium.
Identifiers: *Anesthetic, *Methylpentynol, *MS-222, Narcosis, Drug.

Effective concentrations of methylpentynol for anesthetizing rainbow trout, brown trout, brook trout, and lake trout, were determined by a series of tests. Concentrations of 1.5 to 8 parts per thousand induced anesthesia. Changes in pH or in water hardness had no significant effect on the rate of anesthesia. Repeated anesthesia had little effect on rate of response. The efficacy of anesthetic solutions was reduced by continuous use. Approximately 1 kilogram of rainbow trout could be effectively narcotized per milliliter of drug. Methylpentynol was compared with MS-222 as a fish anesthetic. Fifty - times as much methylpentynol was necessary to yield the equivalent effect of 100 parts per million of MS-222. (See also W70-07840 and W70-07841). (Sjolseth-Washington)
W70-07839

TOXICITY OF METHYLPENTYNOL TO SELECTED FISHES,
Bureau of Sport Fisheries and Wildlife, La Crosse Wis. Fish Control Lab.
Leif L. Marking.
Investigations in Fish Control, No 30, 1969. 6 p, 5 tab, 16 ref.

Descriptors: *Bioassay, *Toxicity, *Mortality, *Fishkill, Rainbow trout, Brown trout, Brook trout, Lake trout, Pikes, Channel catfish, Bass, Walleye, *Resistance, *Lethal limit, Water temperature, Fish physiology, Fish management.
Identifiers: *Methylpentynol, Drug, *Anesthetic, Bluegills.

Methylpentynol was tested in 96-hour bioassays for its toxicity to rainbow trout, brown trout, brook trout, lake trout, northern pike, channel catfish, bluegills, largemouth bass, and walleyes. The LC50's range from 660 to 1,890 parts per million at 12 deg C. Channel catfish are the most resistant and lake trout are the most sensitive. Two-inch rainbow trout, brown trout, and lake trout are more sensitive to methylpentynol than larger ones in 96 hour exposures. The drug is more toxic to bluegills at 17 deg than at 12 deg C. Toxicity was not influenced in different water hardnesses of 10 to 180 parts per million. (See also W70-07839 and W70-07841). (Sjolseth-Washington)
W70-07840

ANNOTATED BIBLIOGRAPHY ON METHYLPENTYNOL,
Bureau of Sport Fisheries and Wildlife, La Crosse Wis. Fish Control Lab.
Gerald E. Svendsen.
Investigations in Fish Control, No 31, 1969. 5 p, 26 ref.

Descriptors: *Bibliographies, *Reviews, *Fish physiology, *Analytical techniques, Fish behavior, Fish management.
Identifiers: *Methylpentynol, Anesthetic, *Annotated bibliography.

Experiments with methylpentynol as an anesthetic for four salmonids to describe its toxicity and efficacy began in 1964 at the Fish Control Laboratory, La Crosse, Wis. The U.S. Food and Drug Administration requires these data for clearance and labeling of drugs. During the study, a number of selected references on fishery uses of the drug, and on its biochemistry, physiology, and methods of analysis were annotated. (See also W70-07839 and W70-07840). Identifiers: *Glycerol, *Phototrophic growth, *Marine phytoplankton (Prymnesium parvum, (Chroomonas salina), Glycerol pollution.

The effects of low (0.05 M) and high (0.5-1.0 M) concentrations of glycerol on the growth of 18 species of marine phytoplankters were studied. The

gae were grown in axenic culture in sea water enched with nitrate, orthophosphate, silicate, traceetal ions, vitamin B12, thiamine, biotin, and bufred at pH 7.6-7.8. Apart from a chrysomonad (Pmnesium parvum and a cryptomonad Chroomonas salina), none of the species showed y significant growth on glycerol in the absence of ht. However, in the presence of light, glycerol hanced the growth of 16 species, in particular embers of the Chrysophycyeae and Cryptphyceae, one diatom (Phaeodactylum tricornutm), one rhodophyte (Porphyridium cruentum), d one chlorophyte (Nannochloris oculata). The hancement effect was observed in the growth te and in the peak population density, which in any instances was several times that from noncerinated cultures and suggested otoheterotrophic growth. Some species showed vious cytological and metabolic changes from owth on glycerol. (Sjolseth-Washington)

RESIDUES IN FISH, WILDLIFE, AND ESTUARIES - ORGANOCHLORINE PESTICIDES IN FUR SEALS,
Bureau of Commercial Fisheries, Seattle, Wash. Biological Lab.
Raymond E. Anas, and Alfred J. Wilson, Jr.
Pesticides Monitoring Journal, Vol 3, No 4, p 198-200, March 1970. 1 tab, 4 ref.

Descriptors: *DDT, *Chlorinated hydrocarbon pesticides, *Dieldrin, *Pesticide residues, Gas chromatography, Alaska, Washington.
Identifiers: *Polychlorinated biphenyls, *Fur seals, *Callorhinus ursinus, *DDE, DDD, Pribilof Islands, Alaska, Brain tissue.

Samples of liver and brain tissue from 30 northern fur seals (Callorhinus ursinus) and 7 fur seal fetuses that were collected on the Pribilof Islands, Alaska, in 1968 and off the Washington coast in 1969, were analyzed for organochlorine pesticides. These compounds were found in all of the fur seals and in three of the fetuses. Polychlorinated biphenyls (PCB) were not detected. Of 30 samples of liver tissue from the seals, all contained DDE; 21, DDD; 24, DDT; and 3 contained dieldrin. Of the 30 brain samples, all contained DDE; 5, DDD; 4, DDT; and none contained dieldrin. DDE was present in liver tissue from three of the fetuses and in brain tissue from two. (Sjolseth-Washington)

EFFECTS OF NITRATE OF CULTURE WATER ON THE GROWTH OF THE JAPANESE PEARL OYSTER (IN JAPANESE),
National Pearl Research Lab., Ago (Japan).
Yukimasa Kuwatani, Tamotsu Nishii, and Fumio Isogae.
English summary. Bulletin of the National Pearl Research Laboratory, Vol 4, p 1735-47, 1969. 11 fig, 3 tab, 15 ref.

Descriptors: *Nitrates, Oysters, Cultural control, *Growth rates, *Water quality, Water quality control, Mortality, *Nitrities, Phosphates, Hydrogen ion concentration, Ammonia, Calcium.
Identifiers: Japanese pearl oyster, *Pinctada fucata, *Culture water.

Thirty, one-year-old pearl oysters were divided into six groups of 5 animals each and reared in recirculating tanks for 52 days. Nitrate content of the rearing water was kept at various levels in the five tanks by adding necessary amounts of sodium nitrate to the water. Average nitrate contents in the control tank and the 5 experimental tanks were 11, 588, 1116, 2478, 5151 and 10540 /ug-at N/1, respectively. As the amount of nitrate added increased, the nitrite content of rearing water increased and the phosphate content decreased. Chemical factors other than nitrite and phosphate showed no marked differences among the tanks. The growth of the oysters during the experimental period in the six tanks in order of increasing nitrate content was 432,416, 496, 428, 316 and 370 mg per oyster in cumulative increase of under-water weight. The authors concluded that nitrate less than 10000 /ug-at N/1 in rearing water has no harmful influences on the growth of oysters under the conditions that pH of seawater is over 8.05 (average, 8.09) and alkalinity is over 1.96 (average, 2.10) mN. (Sjolseth-Washington)

THE RESPONSE OF FRESH-WATER PROTOZOAN COMMUNITIES TO HEATED WASTE WATERS,
Virginia Polytechnic Inst., Blacksburg. Dept. of Biology.
John Cairns, Jr.
Chesapeake Science, Vol 10, No 3 and 4, p 177-185, 1969. 12 ref, 8 fig.

Descriptors: *Water pollution effects, Water pollution sources, *Thermal pollution, Thermal powerplants, *Thermal stress, Thermal water, *Protozoa, Algae, Diatoms, Animal behavior, *Thermodynamic behavior.
Identifiers: *Temperature shock, *Protozoan communities, Potomac River, Savannah River, Shock effects.

The response of fresh-water protozoan communities exposed to both severe acute temperature shocks as well as small gradual long-term increases are discussed. The former experiments were carried out in plastic troughs with a constant flow of unfiltered lake water. Severe acute shocks (some to nearly 50 C) resulted in a marked reduction in number of species present. However, recovery was quite rapid (a matter of a few days) once the temperature stress ceased. Observations of the effects of small gradual long-term increases were made on the protozoan communities of the Savannah and Potomac rivers each of which received heated waste water discharges. Each of these studies covered a period in excess of nine years and observations are still being made. There was no evidence that indicated the protozoan communities of these rivers had been degraded by the small gradual temperature increases resulting from the discharge of heated waste waters. However, there is evidence that competitive exclusion of algal species by other more tolerant algal species may cause qualitative shifts in the community structure which may be undesirable. BIOASSAY OF KING SALMON EGGS AND SAC FRY IN COPPER SOLUTIONS,
California State Dept. of Fish and Game, Sacramento. Water Projects Branch.
Charles R. Hazel, and Stephen J. Meith.
California Fish and Game, Vol 56, No 2, p 121-124, 1970. 3 tab, 4 ref.

Descriptors: *Bioassay, *Copper, Copper sulfate, Heavy metals, Chinook salmon, Fish eggs, Fry, Effects, *Toxicity, Mortality, Growth rates, Inhibition, Water pollution effects, Lethal limit.
Identifiers: *Hatching success.

Flowing water bioassay of chinook salmon (Oncorhynchus tshawytscha) eggs and fry in a copper solution indicated that eggs are more resistant to the toxic effects of copper than fry. Copper concentrations of 0.08 mg/liter did not noticeably affect the hatching success of eyed eggs, but concentrations as great as 0.04 mg/liter were acutely toxic to fry and concentrations of 0.02 mg/liter caused increased mortality and inhibited growth. (Sjolseth-Washington)
W70-07848

EFFECTS ON THE GROWTH OF JAPANESE PEARL OYSTER OF THE VARIOUS ALKALINE REAGENTS ADDED TO THE CULTURE WATER FOR THE CONTROL OF ITS pH (IN JAPANESE),
National Pearl Research Lab., Ago (Japan).
Yukimasa Kuwatani, and Tamotsu Nishii.
English summary. Bulletin of the National Pearl Research Laboratory, Vol 13, p 1597-1616, July 1968. 19 ref, 16 fig, 4 tab, append.

Descriptors: Oysters, Alkaline water, Alkalinity, Alkali metals, *Growth rates, *Hydrogen ion concentration, Cultural control, *Water quality, Water quality control, Carbon dioxide, *Sodium, *Sodium compounds, *Calcium hydroxide, Bicarbonates, Ammonia, Nitrates, Nitrites.
Identifiers: Japanese Pearl Oyster, *Pinctada fucata, *Culture water, *Barbital sodium, *Sodium borate, *Sodium carbonate, *Sodium hydroxide, *Tris-buffer, Carbonate ions.

Thirty five one-year-old pearl oysters were equally divided into 7 groups, which were reared in separate recirculating tanks containing various alkaline reagents (6 were tested) for 56 days. The pH was maintained above 8.0.Tris-buffer or barbital sodium required by far the greatest amount to maintain the pH value of culture water above 8.0, and they were followed by sodium borate, sodium hydroxide, calcium hydroxide and then sodium carbonate. The partial pressure of carbon dioxide was the highest in the culture water added barbital sodium or Tris-buffer, and the second highest in that added sodium borate, while the remaining reagents gave as low values as control. The Tris-buffer-added culture water exhibited a remarkably high level for ammonia, nitrite and nitrate as compared with the case of the other alkaline reagents. From the cumulative growth patterns of pearl oysters reared it was possible to class the seven differently treated groups of oyster as follows: (a) Sodium borate and barbital sodium oyster groups showed the most rapid growth. (b) Calcium hydroxide and sodium carbonate oyster groups showed a slow continuous growth. (c) Sodium hydroxide and Tris-buffer oyster groups showed a decline in weight. (d) Control oyster groups showed a negative growth in weight. Authors concluded that the artificial control of pH of the culture water by alkaline reagents created a favorable condition for the growth of pearl oysters. The reagents which brought about the most rapid growth possessed a considerably low dissociation degree. (Sjolseth-Washington)

RELATION BETWEEN ENVIRONMENTAL CHARACTERISTICS OF WATERS AND CHANGES OF PHYTOPLANKTON IN AN ESTUARY WHERE RED TIDE OFTEN APPEARS (IN JAPANESE),
Mie Prefectural Univ., Tsu (Japan).
Fukuzo Uyeno.
English summary. Bulletin of the Plankton Society of Japan, Vol 16, No 2, p 89-98, 1969. 1 tab, 6 fig, 22 ref.

Descriptors: Environmental effects, Phytoplankton, *Red Tide, Dinoflagellates, Bottom sediments, Essential nutrients, Nutrient requirements, Estuarine environment, Dissolved oxygen.
Identifiers: Skeletonema costatum, *Environmental conditions, Ago Bay, Japan.

The relationship between environmental conditions, especially about the depletion of dissolved oxygen near the bottom, and the occurrence of nannoplankton in an area where red tides often occur was observed in Ago Bay, from 1966 till '68. Land-drainages and upwelled waters from the bottom layers supplied inorganic nutrient salts for phytoplankton bloom. This produced a rapid increase of chlorophyll-a at the surface and in the mid-layer. The former mainly consists of Skeletonema costatum and the latter of flagellates including dinoflagellates. Author concluded that the superficial bottom mud is a source of both inorganic nutrients and trace growth acceleration substances. This analysis of the mechanism of supply of such substances to the water in relation to seasonal changes of environmental conditions and species occurrence will be required for future study. (Sjolseth-Washington)

STUDIES ON THE EFFECTS OF SEVERAL AGRICULTURAL CONTROL CHEMICALS ON THE SPAWNING OF WILD GOLD FISH (CARASSIUS CARASSIUS CUVIERI T. et S.) AND THE HATCHING OF THE EGGS (IN JAPANESE),
Freshwater Fisheries Research Lab., Tokyo (Japan)
Sekio Kimura, and Masahiro Matsushima.
English synopsis. Bulletin of Freshwater Fisheries Research Laboratory, Vol 19, No 2, p 121-135, 1969. 7 tab, 30 ref.

Descriptors: Bioassay, *Mortality, *Dieldrin, *Chlorinated hydrocarbon pesticides, Pesticide toxicity, Fish reproduction, Carp, Water pollution effects, Lethal limit, *Organophosphorus pesticides, *Spawning, Fish eggs, Viability, Hatching, Fish behavior.
Identifiers: *Dipterex, Ethyl parathion, *Lindane, PCP-Na, *MCPCA, Gold fish, Tolerance, Carassius carassius.

The effects of dipterex, ethyl parathion, dieldrin, lindane, PCP-Na, and MCPCA on the spawning of gold fish and the hatching of their eggs were studied. The following conclusions were obtained: The chemicals tested did not affect adult wild gold fish, their spawning ability, or the eggs at the concentrations of 0.1x48 hr TLm for carp fry. Deleterious effects were observed at the concentrations higher than 0.5x48 hr TLm. The authors stress the need to understand the biological effects of chlorinated hydrocarbon and other pesticides which easily accumulate in fish. (Sjolseth-Washington)

SOME LONG-TERM TRENDS IN WATER QUALITY OF RIVERS AND LAKES,
Illinois State Water Survey, Urbana.
William C. Ackermann, Robert H. Harmeson, and Robert A. Sinclair.
Transactions, American Geophysical Union, Vol. 51, No. 6, p 516-522, June 1970. 6 fig.

Descriptors: *Water quality, *Standards, *Pollution abatement, Sulfates, Alkalinity, Chlorides, Dissolved solids, Nitrates, Lake Michigan, Mississippi River, Ohio River.
Identifiers: *Metropolitan areas, Illinois River.

Long term trends of water quality have been examined on reasonably continuous measurements of conservative water quality elements on four areas of significant size. Of particular interest were large areas that reflected major population and technological consequences, and locations where the water quality, in turn, was of importance to a large number of present and future users. The four areas studied were: the southwest shore of Lake Michigan; the Mississippi River at Alton, Illinois the Illinois River at Peoria, Illinois, and the Ohio River at Cairo, Illinois. Five parameters of water quality were examined: chlorides, sulfates, nitrates total dissolved solids, and alkalinity. It was concluded that in recent years accelerated pollution abatement efforts for the parameters and areas studied do not appear to have reversed the trend of increasing waste burdens, much less returned us to the levels of seventy or more years ago. One's degree of concern about this depends upon criteria or benchmarks; but one statement can be made with some confidence: we have not yet overcompensated. (Davis-Chicago)

EFFECTS OF INSECTICIDES ON ALGAE,
Ontario Water Resources Commission, Toronto. Div. of Research.
A. E. Christie.
Water and Sewage Works, Vol 116, p 172-176, 1969. 6 tab, 31 ref.

Descriptors: *Algae, *Insecticides, Toxicity, Degradation (Decomposition), DDT, Alkalinity, Stabilization, Waste storage, Ponds, Hydrolysis, Metabolism, Chemical reactions, Chlorella, Tracers, Radioactivity, Carbon radioisotopes, Hydrogen ion concentration, Scenedesmus, Euglena, Bacteria, Yeasts, Actinomycetes, Ponding, Waste treatment.
Identifiers: Sevin, Malathion, Chlorella pyrenoidosa, Schroderia, Thimet, Trichoderma.

DDT, Sevin, and Malathion were studied to determine their effect on algal populations associated with waste stabilization ponds and their possible degradation in an algal environment. The pesticides vary in degree of toxicity to algae and in extent to which they are degraded in presence of algae. DDT exhibited no toxic properties up to concentrations of 100 milligrams/liter and received only slight degradation. Sevin is toxic at concentrations above 0.1 milligrams/liter and is not altered appreciably in acidic media. Malathion appears to receive extensive conversion and, although capable of altering composition of a mixed algal community, did not display persistent inhibitory effect. Extending this to the alkaline waste stabilization pond and its algal community, entry of DDT, up to 100 milligrams/litee, is not likely to be toxic nor will the material be degraded by algae. A similar quantity of Sevin would seriously reduce efficiency of the pond with conversion more likely to occur by alkaline hydrolysis than algal metabolic processes. An equivalent slug of Malathion, although temporarily interrupting operation of the pond, could be broken down rapidly by chemical and metabolic reactions. (Jones-Wisconsin)

INSECTICIDE RESIDUES IN SOME COMPONENTS OF THE ST LAWRENCE RIVER ECOSYSTEM FOLLOWING APPLICATIONS OF DDD,
Department of Agriculture, Saskatoon (Saskatchewan); and Saint Dunstan's Univ., Charlottetown (Prince Edward Island). Dept. of Chemistry.
F. J. H. Fredeen, and J. Regis Duffy.
Pesticides Monitoring Journal, Vol 3, No 4, p 219-226, 1970. 4 tab, 14 ref.

Descriptors: *Insecticides, *St Lawrence River, Water pollution sources, Water pollution effects, Mud, Mollusks, Fish, Insects, DDT, Silts, Suckers, Catfishes, Bass, Perches, Pikes, Sampling, Snails,

lgae, Diatoms, Clams, Shellfish, Amphipoda, Vater birds, Wisconsin, Analytical techniques.
lentifiers: *Residues, *DDD, DDE, TDE, Black- y larvae, Cladophora, Cyprinus carpio, 'atostomus commersoni, Ameiurus nebulosus, erca flavescens, Ambloplites rupestris, Esox lu- ius, Campeloma, Psidium, Shadfly, Chironomids, lear Lake (Calif), Richelieu River (Quebec), ireen Bay (Wis), Mackerel, Montreal (Canada).

DD (TDE) residues were measured in water, ud, mollusks, and fish of the St Lawrence River in 967 during and after applications of DDD to con- ol nuisance insects. Concentrations detected in ater (up to 0.0139 ppm) ranged from 1 to 17% of ose applied to the river 10 miles upstream. DDD oncentrations in mollusks 17 miles upstream from e point of application and 10 and 45 miles ownstream, averaged 0.002, 0.101, and 0.0 ppm, espectively. In the same samples, concentrations f DDT and DDE combined (from unknown ources) averaged 0.030, 0.225, and 0.027 ppm. In dible flesh from 216 fish of 5 species, DDD esidues averaged 0.156 ppm in samples collected 7 miles upstream and 0.369 in the combined sam- les from points 10 and 45 miles downstream. esidues of DDT plus DDE in these same samples veraged 0.224 and 0.227 ppm, respectively. The ighest concentration of DDD in an individual fish as 1.81 ppm. The ultimate fate of the DDD, that is s conversion to materials with reduced toxicities, poorly understood. DDD is itself a product of the eductive dechlorination of DDT in nature. (Jones- Visconsin)

lentifiers: *Soluble substances, Germanium diox- e, Diversity index, Lago Banolas (Spain).

method to assess the potential damage of a par- cular water soluble compound released in lakes nd streams is described. The results of a test, using ermanium dioxide which has a known effect, pro- ded evidence that quantitative changes in the spe- es composition of the colonizing periphyton com- unity reflect the nature of the toxicant to which ey were exposed. Natural diatom growth in the resence of germanium was inhibited and the ensu- g changes in the species composition of the eated community were reflected in changes in the versity index. The major disadvantage in applying is technique to general usage is that the concen- ation of the toxicant at the gel-water interphase is either controllable nor known under the condition escribed for this experiment. However, anti-foul- g resins are available for which the leaching rates chemicals with different solubility coefficients nd for different current velocities are known. The ajor advantage of this technique is its wide poten- al applicability. Wherever a pollutant, such as an secticide, is suspected, it could be impregnated in gel and exposed to the periphyton in the same or similar area as that into which the toxicant would released. Pesticides Monitoring Journal, Vol 3, No 3, p 186-189, 1969. 2 tab, 6 ref.

Descriptors: *Pesticides, *Copper sulfate, *Irrigation canals, Suspended load, Sediments, Bottom sediments, Algicides, Washington, Sampling, Aquatic weeds, Chlorophyta, Rooted aquatic plants, Rainbow trout, Crops, Washington.
Identifiers: Sunnyside (Wash), Rhodamine-B.

Chemical and physical behavior was determined of copper sulfate applied as algicide in irrigation canal water. Measurements of copper concentrations in water, in suspended sediment, and in bottom sediment of an irrigation canal after a copper sulfate treatment at 1 pound/cubic feet per second indicate that, after dissolution, much of the copper is sorbed by suspended sediment which gradually settles to the canal bottom. A large part of the copper in the deposited sediment is then slowly fed back into the canal water over a period of many hours. Copper buildup in irrigated soils appears to be minor and the possibilities of harmful effects from the release of such treated water for irrigation or domestic purposes are remote. Copper accumulation in the irrigated soil is far below levels toxic to crop plants. Similar treatments have been commonly used for decades as algae control; as far as known, harmful effects from such usage in irrigation canals have never occurred or been reported. The fish studied apparently survived because peak concentrations were of short duration and because dead algae did not accumulate to clog gills. (Jones-Wisconsin)

THE INHIBITORY EFFECTS OF COPPER ON MARINE PHYTOPLANKTON,
Dow Chemical Co., Freeport, Tex. Texas Div.
E. F. Mandelli.
Marine Science, Vol 14, p 47-57, 1969. 6 fig, 1 tab, 21 ref.

Descriptors: *Marine water, *Copper, *Algae, Sea water, Temperature, Salinity, Bioassay, Analytical techniques, Lethal limits, Dinoflagellates, Diatoms.
Identifiers: *Copper chloride, Uptake, Freundlich isotherm, Blue-green algae, Green algae.

The growth of several species of dinoflagellates and diatoms in batch cultures under continuous illumination was inhibited at 20C by concentration of copper between 0.055 and 0.265 microgram/milliliter. Coccochloris elabans failed to grow at 0.03 microgram/milliliter and 40C, whereas Dunaliella tertiolecta survived 0.6 microgram/milliliter at 30C. Skeletonema costatum in light-dark cultures with maintenance of constant number of cells and copper ions was inhibited at 0.05 microgram/milliliter. A positive correlation was found between the log of copper uptake:biomass of algae ratio and the temperature, and a negative correlation between the same ratio and salinity. (Wilde-Wisconsin)

Identifiers: *Chlorophenols, Bacteriological analysis, Iron chloride, Lake Zurich, Lake Pfaffikon.

The distribution path of purified sewage effluent in Lake Pfaffikon was traced by chemical and bacteriological analyses. The sewage travelled intact from the shore down the slope to a depth of 5 meters and then spread out horizontally. The industrial effluent, contaminated with phenol, entered Lake Zurich at a depth of 31 meters and was diverted by the current over a distance of 2200 meters to the intake of drinking water. The chlorination of water gave rise to chlorophenols thereby rendering water unpalatable to 80,000 people for a period of 1 to 2 days. (Wilde-Wisconsin)

THERMAL LOADING-NEW THREAT TO AQUATIC LIFE,
Maryland Univ., College Park. Dept. of Environmental Research.
Joseph A. Mihursky.
Catalyst, Vol. 2, No. 3, p 6-9, (1969). 2 fig.

Descriptors: *Thermal pollution, *Aquatic life, *Cooling water, Powerplants, Metal pipes, Cooling towers, Nuclear energy, Chlorine, Seasonal, Oysters, Salmon, Trout, Clams, Striped bass, Shellfish, Water pollution effects.
Identifiers: Chesapeake Bay.

The problem of thermal pollution and its effect on aquatic life are examined. The excess temperatures associated with thermal pollution may cause as much as 100 per cent mortality among aquatic animals. This increase in temperature is usually caused by man's increased production of electricity. The fossil fuel powerplants of the past, however, produced less thermal pollution than our newer nuclear powerplants. These newer plants demand more cooling water than is available in the streams where water is already being used for cooling. A problem that often arises is corrosion of metal tubes. An example of the results of this corrosion is the green oyster caused by a high copper concentration in the water. There are basically three alternatives to the problem. They are: (1) ignore the problem; (2) produce electricity in a different manner; or (3) find ways to redirect waste heat. At present, two new engineering designs to help correct the problem are the evaporative cooling towers and a closed circuit cooling system similar to an automobile radiator. The author proposes further research on eleven area recommendations. (Osborne-Vanderbilt)
W70-08119

THERMAL EFFECTS: A REPORT ON UTILITY ACTION,
F. C. Olds.
Power Engineering, Vol 74, No 4, p 26-31, April 1970. 2 fig, 4 tab.

Descriptors: *Utilities, *Thermal pollution, *Surveys, Cost-benefit analysis, Cooling towers, Ponds,

Water temperature, Power system operations, Design criteria, Standards, Heat flow, Water pollution effects.
Identifiers: Mixing zone.

The results of a thermal discharge survey conducted by Power Engineering are described. The survey includes 43% of all utilities in the U.S. with 8-Mw or more of steam-electric generating capacity. Data dealing with percent of return and type of utility is listed in tabular form. The results indicated that 123 utilities of the 135 utilities reporting may not be in compliance with existing standards. Moreover, companies with higher capacities are not in compliance as much as those with lower capacities. Further, the survey showed a tendency for utilities to change from direct discharge to cooling towers for their next plants. Twenty companies estimate that they will spend 157 million dollars on new plants to ensure that they meet new water temperature standards. From this analysis, four major aspects of temperature compliance stand out clearly. They include: (1) temperature standards are a moving target; (2) mixing zones are undefined; (3) upper temperature limits are rigidly and capriciously set; and (4) as standards become more stringant, costs skyrocket. (Osborne-Vanderbilt)

FIELD SITES AND SURVEY METHODS,
Johns Hopkins Univ., Baltimore, Md. Dept. of Environmental Engineering Science.
John C. Geyer, John E. Edinger, Willard L. Graves, Jr., and Derek K. Brady.
Cooling Water Studies for Edison Electric Institute, Report No 3, June 1968. 42 fig, 43 tab, 4 ref. EEI Research Project RP-49.

Descriptors: *Thermal pollution, *Meteorology, *Instrumentation, *Data collection, Heat exchangers, Thermal stratifications, Hydrographs, Powerplants, Water pollution effects.
Identifiers: *Data reduction, *Heat dissipation, Parameters, Receiving waters, Thermographs, Pyrheliometer, Dispersion coefficient.

The main features of eleven field sights are summarized and described including the survey data collection techniques used to investigate the dissipation of heat from the different types of natural waters which received the heated discharges from the eleven thermoelectric generating plants. A history of the development of this study is followed by a tabulation of the geographical and hydrological features of each study site, complete with details of types of survey instruments, survey procedures and data reduction techniques. The eleven study sites were compared first in terms of their geographic location and climate, then by groups according to type of receiving waterbody, and also in terms of their various heat dissipation characteristics. Comparisons were made between the various survey procedures adopted at each site, and between the different types of meteorological instruments used. The methods of data reduction employed at the field sites are summarized, and an outline is given of the data processing required prior to storage and retrieval for interpretation and analysis. The analytical objectives of the study are also summarized in relation to the applicability of the different study sites to these objectives. (Osborne-Vanderbilt)

ENVIRONMENTAL EFFECTS OF NUCLEAR COOLING FACILITIES,
Oregon State Univ., Corvallis. Dept. of Atmospheric Sciences.
William P. Lowry.
American Meteorological Society, Bulletin, Vol 51, No 1, p 23-24, January 1970.

Descriptors: *Fog, *Cooling towers, Temperature, Vapor pressure, Winds, Humidity, Climatology, Atmospheric physics, Water pollution effects, *Environmental effects.
Identifiers: *Cooling ponds, Wet plumes.

The foreseeable but not quantifiable variable, fogging, was discussed. Also, the effects that cooling towers and cooling ponds might have on fogging conditions were considered. The conclusion reached after considering these environmental effects was that under the climatic conditions of western Oregon, a significant fraction of the days of each year fall in the middle of the spectrum of uncertainty, thereby representing a potential or latent fogging problem. Moreover, the scientific and engineering professions do not now have either the information or the experience necessary even to begin operational avoidance or reduction of the fogging problem which we know exists in connection with industrial cooling tower and pond facilities. (Osborne-Vanderbilt)

MOISTURE POLLUTION OF THE ATMOSPHERE BY COOLING TOWERS AND COOLING PONDS,
Oregon State Univ., Corvallis. Dept. of Atmospheric Sciences.
E. W. Hewson.
American Meteorological Society Bulletin, Vol. 51, No. 1, p 21-22, January 1970.

Descriptors: *Atmospheric physics, *Cooling towers, Chemical wastes, Terrain analysis, Precipitation (Atmospheric), Humidity, Wetting, Air temperature, Winds, Cities, Water pollution effects.
Identifiers: *Cooling ponds, *Moisture pollution, Visibility, Icing, Sunshine.

Possible meteorological influences as could be encountered from water vapor releases from cooling towers and cooling ponds are reviewed. Such meteorological aspects as visibility, precipitation, humidity, wetting, icing, sunshine, temperature, and wind are discussed. An additional problem concerning an effluent containing chemical pollutants is considered. This consideration was made for both flat terrains and in valleys. Other terrain modifications to the atmospheric moisture problem were made for the special cases of urban areas and along shorelines. In general, the influence is likely to be local or non-existent. The possibility of greater stability of natural fogs due to heat input is increased. (Osborne-Vanderbilt)

TEMPERATURE TOLERANCE OF EGGS AND YOUNG OF COLUMBIA RIVER CHINOOK SALMON,
Hanford Atomic Products Operation, Richland, Wash.
P. A. Olson, and R. F. Foster.
Transactions of the American Fisheries Society, Vol 85, p 203-207, 1957. 2 fig, 2 tab, 3 ref.

Descriptors: *Chinook salmon, *Salmon, *Fish, Fish eggs, Growth stages, Fish reproduction, Fry, Columbia River, *Thermal pollution, Temperature, Seasonal, Fluctuation, Period of growth, *Water pollution effects.
Identifiers: Priest Rapids Dam.

A study was made on the temperature tolerance of eggs and young of chinook salmon which spawn in the main stem of the Columbia River. The control temperature followed a seasonal trend typical for the locality. It started at 57 deg F, reached a minimum of 36 deg F, and increased to 47 deg F at the end of the test. Other experimental lots averaged about 4 deg F colder and 2 deg F, 4 deg F, and 8 deg F warmer than the control throughout the greater part of the test. Significant mortality above that of the control occurred only in the warmest lot. Although about 90 percent of the eggs in this group hatched successfully, the fry and early fingerlings suffered heavy mortalities even though the mean temperature of this lot was well below 50 deg F during the fingerling stage. The results of this single experiment indicated that the eggs could begin incubation at temperatures as high as 61 deg F without significant loss. (Speakman-Vanderbilt)

NUCLEAR POWER AND THERMAL POLLU TION: ZION, ILLINOIS,
Argonne National Lab., Ill. Radiological Physic Div.
Philip F. Gustafson.
Bulletin of the Atomic Scientists, Vol 26, No 3, p 17-23, March 1970. 5 fig.

Descriptors: *Thermal pollution, Radioactiv wastes, *Nuclear wastes, Water law, *Powerplants Aquatic plants, Lake Michigan, Heat transfer Seasonal, *Water pollution effects.
Identifiers: Maximum possible concentration.

In the Chicago metropolitan area, the Common wealth Edison Company is building new nuclea power plants to provide badly needed additiona generating capacity. Fear of radioactive discharge and thermal pollution has provoked two lawsuits seeking injunctions to restrain the utility from discharging heated, effluent water and radioactive material from a 2,200,000 kilowatt, two uni nuclear power plant at Zion, Illinois into Lak Michigan. One of the sawsuits has been brought by the Metropolitan Sanitary District of Greate Chicago. It asserts that condenser-heated lak water will 'radically raise the temperature of sub stantial parts of the waters of the lake and caus thermal pollution, severely and deleteriously af fecting the ecology of the lake.' A second suit con tends that three billion gallons of lake water a da would be heated 18 to 20 degrees Fahrenheit abov ambient lake temperature. Its discharge back int the lake would increase the toxicity of existing pol lutants, stimulate the growth of aquatic plan nuisances and speed up the deterioration of Lak Michigan. The suits cite the threat of radioactiv pollutants in the lake, the principal source o domestic water in a region of eight million people The author concludes that the amount of nuclea power to be installed by 1975 gives no cause fo concern about thermal or radioactive pollution Further work is needed to ascertain effects of con tinued installation of power plants along Lak Michigan. (Osborne-Vanderbilt)

COOLING RESERVOIR STUDY,
J. D. Calbert.
Power Engineering, Vol 71, No 12, p 52-53, De 1967. 1 fig, 1 tab.

Descriptors: *Cooling water, Feasibility studies *Water temperature, *Computer programs, Mode studies, Energy budget, Air temperature, Stream flow, Water rights.
Identifiers: *Square Butte Creek, Cooling reser voir.

Low-cost energy from lignite was to be available i early 1970 from Minnkota's new 121-Mw plant a Center, N.D. In determining the feasibility of thi project, Minnkota engineers assessed Square Butt Creek, flowing through the lignite fields, as potential water supply. The results favored con struction of an economic dam and reservoir. Th fundamental considerations in the planning an design of the cooling reservoir were assessed by comprehensive computer program. An energ budget analysis involving a relationship betwee degrees of cooling required and net heat loss pe unit of cooling pond area was used along with great deal of meteorological and streamflow data Further, the data was based on the critical condi tions along Square Butte Creek during 1960 an 1961. The results showed that the initial 212-Mw steam unit could operate on the proposed reservoi without make-up water beyond natural flow. Thi paper contains a table of the actual computer read out for the 31 days in July 1961 (the most critica time period) showing what the operating condi tions would have been. About 2 acres of water sur face per megawatt were required. (Osborne-Van derbilt)

D. Waste Treatment Processes

IE INCINERATION OF SOLID AND LIQUID ASTE AT FABENFABRIKEN BAYER,
orst W. Fabian.
oceedings of the Industrial Waste Conference, rd, 1968, p 874-882. 6 fig.

escriptors: *Incineration, *Industrial wastes, olid wastes, *Liquid wastes, *Costs, *Air pollun, *Gases, Chlorine, Heat exchangers.
entifiers: *Chlorine wastes, Afterburners, Rotary n.

the 500,000 cubic meters of wastes produced nually at the Leverkusen Works of Farnfabriken Bayer, 40,000 metric tons of solid, sty, and liquid wastes can be incinerated. An inerator plant, built in 1967 at a cost of 18 million marks disposes of these wastes at a cost of 80-0 D-marks per metric ton. Incineration of most stes occurs in a rotary kiln 12 meters by 3 mers, with detention times of 30-60 minutes at a mperature of 1200 deg C. Solid wastes are duced 90% by volume, and 70% by weight. aste gases (60,000-70,000 Nm3/hr) are sent rough a system of afterburners at 1200 deg C and en to a series of heat exchangers before discharge rough a 100 meter stack. Up to 25 metric tons of eam are recovered per hour at 400 deg C and 40 /sq cm. Wastes with chlorine are burned in other flame tube and the waste gases are treated parately in a water scrubber which has an effiency of 95% and reduces the waste gas to less an 1000mg/Hm3HCl, the upper limit specified by e authorities. Upon completion of a sewage treatent plant, another 150,000 cubic meters of sludge ll be incinerated at this plant each year. (Makelexas)

ODEL STUDY OF COLLOID REMOVAL,
innesota Univ., Minneapolis.
alter J. Maier.
urnal of the Water Pollution Control Federation, ol 40, No 3, Part 1, p 478-491, March 1968. 8 fig, tab, 16 ref.

escriptors: *Biological treatment, *Colloids, Thin ms, *Waste water treatment, Efficiencies, Slime, ctivated sludge, Concentration (Composition), osts, *Enzymes, Trickling filter.
entifiers: *Starch.

ological treatment of colloidal starch solutions is scribed in terms of a sequence of steps any one of nich may be rate controlling: (1) mass transfer of bstrate from bulk liquid phase to cell or active nzyme site, (2) degradation of colloidal particles to smaller fragments to facilitate passage through e semi-permeable membrane of metabolising cteria cells, (3) metabolism of the substrate parcles within the cells to provide energy and buildg blocks for growth. Experimental results of two pes of reactors are described using starch as a presentative colloid. Results from process variae studies show that mass trasfer is the rate conolling factor in a laminar film flow reactor which nulates trickling filter conditions. On the other nd, high rates of mass transfer are obtained in a ell mixed reaction vessel simulating activated udge conditions due to eddy current transport. ydrolytic degradation of colloid starch into small oluble carbohydrates proceeds rapidly and does ot appear to be rate limiting in either type of reacon. Hydrolysis is mediated by enzymes which are vailable outside the confines of the semi-permeae cell membranes. Enzyme activity was observed cell-free filtrates thus indicating some presence free enzymes in solution. It is theorized that it ould be possible to improve the efficiency of ickling filters by increasing the mass transfer. This ould be accomplished by improved packing design nd/or agitation. (Hancuff-Texas)

BIOLOGICAL TREATMENT OF MIXTURES OF TEXTILE WASTES AND DOMESTIC SEWAGE,
Cone Mills Corp., Greensboro, N.C.
R. H. Souther, and T. A. Alspaugh.
Sewage and Industrial Wastes, Vol 28, p 166-176, 1956. 13 tab, 1 fig, 14 ref.

Descriptors: *Sewage, *Trickling filters, Pilot plants, Alkalinity, Sedimentation, Filtration, Activated sludge, Domestic wastes, *Biological treatment, Waste water treatment.
Identifiers: *Textile mill wastes.

Experiments were made on a mixture of sewage and highly alkaline textile mill waste waters to compare the efficiency of three different methods of treatment, these methods being (1) two-stage sedimentation and high-rate biological filtration, (2) single-stage high-rate filtration followed by the activated-sludge process, and (3) a two-stage high-rate filtration followed by the activated sludge process. A mixture of 40% of the waste water and 60% sewage was applied at rates of 125, 150, 210 and 250 gal/day. Filters were 1.25 feet in diameter. The results showed that method 2 gives an effluent suitable for discharge to a small stream, the reduction in BOD varying from 78% at a rate of flow of 125 gal/day to 66% at a rate of 250 gal/day. Except at a rate of flow of 125 gal/day with a recirculation ratio of 2:1, two-stage filtration and final sedimentation alone did not give as satisfactory effluent as method 2. Method 3 gave excellent results, with reductions in BOD varying from 97.4% at a rate of 250 gal/day. It is planned to continue the study. (Work-North Carolina State)

WASTEWATER TREATMENT PLANT DESIGN EXPERIENCE AT VANCOUVER, BRITISH COLUMBIA,
Greater Vancouver Sewage and Drainage District (British Columbia).
D. G. Devlin.
Journal of the Water Pollution Control Federation, Vol 40, No 3, p 468-477, March 1968. 3 fig, 2 tab.

Descriptors: *Waste water treatment, *Sewage treatment, Design, Digestion, Chlorination, Sludge Operation and Maintenance.
Identifiers: *Primary treatment, Vancouver (British Columbia).

A discussion of problems and solutions is presented for operation of two primary waste water treatment plants in the Vancouver district for the Lion's Gate treatment plant and Iona Island Plant. The Lion's Gate treatment plant consists of prechlorination, communution, preaeration, grit removal, sedimentation, post-chlorination, and sludge digestion with use of digester gas in boilers and engines. The first problem experienced was that of infiltration into the interceptor sewers; the sources are being sought out and eliminated. The practice of discharging septic tank pump trucks directly to the influent had to be discontinued due to the shock loading effects. The solution, direct transfer to the digesters had to be discontinued due to the restrictions on the quantity of digested sludge permitted to be discharged to the Strait of Georgia. Some difficulties experienced in sampling the influent and effluent are presented. Experiences at the Iona Island treatment plant are enumerated much along the same lines. In spite of these problems, the plants are said to have generally functioned well. (Hancuff-Texas)

DESIGN OF THE NEWTOWN CREEK WATER POLLUTION CONTROL PROJECT,
Department of Water Resources, New York. Bureau of Water Pollution Control.
Joseph Cunetta, and Robert Feuer.
Journal of the Water Pollution Control Federation, Vol 40, No 4, p 643-658, April 1968. 2 fig, 11 tab.

Descriptors: *Waste water treatment, *Design, *Costs, Activated sludge, Sewage treatment, Pollution abatement, Aeration, Digestion, Screens, Sludge, New York.
Identifiers: Newtown Creek (New York), Parameters, Barging.

The intercepting sewer system for the Newtown Creek project serves portions of the burroughs of Manhattan, Brooklyn, and Queens, and collects from a drainage area of 15,389 acres. The Newtown Creek treatment plant utilizes high-rate activated sludge process, and has a design capacity of 310 mgd from an estimated equivalent population of 2,500,000. Included in the report is a description of the area and population served, the waste water treated, methods of conveyance, receiving water ways, plant site, and treatment units used. The dimensions, capacities, areas, loadings, removal capabilities, volumes, operating conditions, detention times and other parameters are tabulated for each unit process. The facility includes grit chambers, aeration tanks, sedimentation tanks, digesters, and the facilities for hypochlorination of plant effluent. The high rate activated sludge process is designed to achieve removals of 70% of the suspended solids and 60% of the BOD, both of which are estimated at 200 mg/l influent. A high-rate digestion is provided for the sludge prior to barging to sea. When completed, the Newtown Creek Water Pollution Control project will have cost approximately $167,000,000. (Hancuff-Texas)

APPLICATION OF COMPLETELY MIXED ACTIVATED SLUDGE DESIGN EQUATIONS TO INDUSTRIAL WASTES,
Kansas Univ., Lawrence.
Carl E. Burkhead, and Ross E. McKinney.
Journal of the Water Pollution Control Federation, Vol 40, No 4, p 557-570, April 1968. 13 fig, 7 tab, 7 ref.

Descriptors: *Activated sludge, *Mathematical model, *Industrial waste, Degradation (Decomposition), Waste water treatment, Design, Biochemical oxygen demand, Chemical oxygen demand, Energy, Mixing.
Identifiers: *Warburg.

A total of 19 separate Warburg runs were made on 15 different substrates. The oxygen uptake curves show the energy utilized during synthesis and endogenous respiration. The soluble COD curves illustrate the rate of removal of the substrate, while the insoluble COD curves show the incorporation of insoluble substrate into microbial mass. The most important aspect of the McKinney equations was considered in the analysis of this data: the basic energy synthesis relationship. It had previously shown for domestic sewage that in terms of the oxygen equivalents of biodegradable substrate that 1/3 of the substrate's total oxygen demand would be used for energy while 2/3 of the total oxygen demand would be converted into microbial protoplasm. This relationship was shown to be valid only for domestic sewage. The energy-synthesis proportionality constant K1 equals 0.50 for domestic sewage. However, new constants which are dependent on the nature of the waste have been measured. They are 0.33 for carbohydrates and 0.92 for non-carbohydrates. Other less substantiated K1 values are 0.92 and 0.71 for amino and fatty acids respectively. Use of data for design is discussed step by step and a sample program is presented. (Hancuff-Texas)

START-UP OF NEW WASTE WATER TREATMENT PLANTS,
Ontario Water Resources Commission, Toronto.
D. S. Caverly.
Journal of the Water Pollution Control Federation, Vol 40, No 4, p 571-580, April 1968.

Descriptors: *Waste water treatment, *Sewage treatment, *Operation and maintenance, Digesters, Aeration, Chlorination, Education, Plants, Activated sludge.
Identifiers: *Start-up, *Check-out, *Routine, *Procedures.

The Ontario Water Resources Commission has developed a program of start-up procedures coupled with operator training that has proven beneficial in the commission's operations. The start-up procedures have been developed over a period of years with the operation of 93 waste water treatment plants as the guide. The start-up procedure consists of 4 days of intensive check-out followed by a series of inspections which last over a period of weeks. The first day is the most comprehensive including study of the blue prints with the plant operator and a full general explanation of each unit process. Before any waste water is permitted to flow into the plant, units must be inspected carefully during the dry check-out. The steps include inspection of the influent works, primary tanks, aeration tanks, digesters, and general overall mechanical equipment. For the wet check-out procedures are given for investigating the mechanical operations of the previously listed unit processes. Two detailed methods are given for the development of suspended solids in the mixed liquor. Of extreme importance in the start-up of a plant is acquainting the operator with the plant and the procedures he must follow to operate it properly. (Hancuff-Texas)

CLOSED LOOP CHLORINATION FOR WASTE WATERS,
Metcalf and Eddy, Inc., Boston, Mass.
Ariel A. Thomas, and Walter H. Brown.
Journal of the Water Pollution Control Federation, Vol 40, No 4, p 684-688, April 1968. 2 fig.

Descriptors: *Chlorination, *Automatic control, Waste water treatment, Costs, Design, Equipment, Chlorine, Coliforms.
Identifiers: *Closed loop chlorination, Dosage, Residual.

Closed loop chlorination provides a relatively inexpensive method by which all treatment plants can provide effective chlorination. Hardware to provide chlorination control by flow has been available and in satisfactory use for many years. It costs approximately $5,000 and requires maintenance as does any instrumentation equipment. These instruments can replace four men required to measure chlorine residuals around the clock and actually compute continuous chlorine residuals which can be recorded. The information from chlorine residual instruments can be returned to controls which change the rate of chlorine feed to the waste water. This system of continually determining chlorine residual and continually adjusting the rate of chlorine feed to get a predetermined chlorine residual is called closed loop chlorination. The loop is formed by feeding back upstream control information. The future efficiency of treatment expected will make accurate manual control almost impossible, leaving closed loop chlorination the answer for economical and effective chlorination of treated and untreated waste waters. (Hancuff-Texas)

AIR TESTING SANITARY SEWERS,
Bloomington, Minn.; and Cherne Industrial, Inc., Hopkins, Minn.
Sam H. Hobbs, and Lloyd G. Cherne.
Journal of the Water Pollution Control Federation, Vol 40, No 4, p 636-642, April 1968. 10 fig, 1 tab.

Descriptors: *Sewers, *Testing, *Leakage, Pressure, Infiltration, Joints (Connections), Costs, Construction.
Identifiers: Television, Bloomington, Minnesota.

A test of every sewer line after construction is imperative. In the past, two types of accepted testing have been required: (1) a ball must be flushed through every section of the sewer pipe to insure against major structural failures, (2) infiltration or exfiltration tests must be made. The infiltration test consists of plugging the upper end section of a sewer and measuring the flow at the lower end. The exfiltration is performed by plugging the lower end and measuring the flow required to maintain a level of 4 foot head. The present specifications permit leakage (infiltration or exfiltration) not to exceed 3.2 gallons per hour/100 ft of sewer. Air pressure loss was tested and found to correlate with exfiltration. A good straight-line correlation was found in clay pipe; however, no definite correlation applicable to all materials could be determined. For the clay pipe 1 psi pressure was almost equivalent to the exfiltration specification of 3.2 gallons per hour/100 ft. When attempting to locate severe leakage test plugs with a short length of cable and testing line are pulled through the sewer. These are spaced at 22 inch centers, pulled into position, inflated, pressure built up, tests made, and the plugs deflated and moved to the next position. Television inspection of several sewer line sections confirmed the results of air testing data. (Hancuff-Texas)

KINETICS OF MODEL AND FIELD EXTENDED-AERATION WASTE WATER TREATMENT UNITS,
Mississippi State Univ., State College.
E. Joe Middlebrooks, and C. F. Garland.
Journal of the Water Pollution Control Federation, Vol 40, No 4, p 586-612, April 1968. 27 fig, 5 tab, 59 ref.

Descriptors: *Activated sludge, *Kinetics, *Mathematical model, *Sewage treatment, Growth rate, Efficiency, Waste water treatment, Microorganisms, Prototypes.
Identifiers: *Extended aeration, Sludge volume index, Parameters.

Mathematical models were found to simulate the performance of actual field installations. Raw waste water was used as an influent substrate in the continuous flow model studies and its performance was found to be superior to that obtained with synthetic wastes. Non-flocculant solids appear to effect the periodic solids losses in the effluent as much as de-nitrification or hydraulic loading variations. The data collected from laboratory units using raw waste water to obtain design parameters are said to be applicable when determining the required mixed liquor suspended solids and the oxygen uptake rate for a given prototype system. Operation at a high suspended solids level will increase variation in the effluent quality. The laboratory units showed that the specific organism decay rate increases with influent substrate concentration. (Hancuff-Texas)

PHOTOCHEMICAL DEGRADATION OF REFRACTORY ORGANIC COMPOUNDS,
Washington Univ., St. Louis.
Charles D. Bulla, III, and E. Edgerley, Jr.
Journal of the Water Pollution Control Federation, Vol 40, No 4, p 546-556, April 1968. 5 fig, 2 tab, 7 ref.

Descriptors: *Ultraviolet radiation, *Organics, *Degradation (Decomposition), Waste water treatment, Adsorption, Toxicity, Pesticides, Irradiation, Electromagnetic waves, Aldrin, Dieldred, Endrin.
Identifiers: *Photochemistry.

Photochemical reactions are initated by the absorbance of electromagnetic radiation energy by an atom or molecule. This process elevates the absorbing species to a higher energy level usually causing the species to become unstable and through a deactivation process revert to a lower less energetic and more stable state. Investigation of the photochemical degradation of aldrin, dieldren, and endrin, in dilute aqueous solutions are made. All three compounds are subject to photochemical degradation by 2537A deg. electromagnetic radiations. Process variables; time, depth, and power may be related to the degradation rate of any one of the compounds studied by a convenient mathematical model. Temperature was shown to have no influence between the range of 20 deg. and 40 deg. C. A bioassay of blue gills showed that the irradiated aldrin was less toxic than pure aldrin itself. Cost estimates for 50% degradation of pesticides at a 10 cm depth are given as $24.50/10 to the 6th gal. for aldrin; $73.00/10 to the 6th gal. for dieldren; $57.50/10 to the 6th gal for endrin. (Hancuff-Texas)

ENERGY INDUCED CHANGES IN AN AZO DYESTUFF,
AeroChem Research Labs., Inc., Princeton, N.J. and Rutgers - The State Univ., New Brunswick, N.J.
Alan I. Mytelka, and Raymond Manganelli.
Journal of the Water Pollution Control Federation, Vol 40, No 2, Part 1, p 260-268, April 1968. 8 fig, 2 tab, 20 ref.

Descriptors: *Irradiation, *Cobalt radioisotopes, *Industrial waste, *Waste water treatment, Hydrogen ion concentration, Dissolved oxygen, Biochemical oxygen demand, Gamma rays.
Identifiers: *Dyestuff, *Ionizing, Chemical oxidation, Luminants, Sterilization, Solids.

A study of Color Index Direct Red 79 is made to determine the changes in properties after irradiation. The experimental conditions under which the irradiation took place were waste dilution of approximately 100:1, pH of 12.1 and a dose rate of 0.17 megarads/hour. Gas was bubbled through the waste at 40% oxygen and 60% nitrogen. After the absorption of 2.6 megarads, the COD was reduced 61%, TOC decreased 43% and for all practical purposes none of the dye remained. The ionizing radiation source was Cobalt 60 gamma radiation. The effect of ionizing radiation on the biodegradability was also studied. Increasing the dose improved the biodegradability of the waste from an initial value of 9 mg/l of oxygen uptake (5-day Warburg) with no irradiation, to 85 mg/l oxygen uptake with 2.5 megarads of irradiation. At the same doses the COD:BOD ratio decreased from 54.0 to 2.2. The latter figure is significant since it is approximately the same as domestic sewage. (Hancuff-Texas)

STUDY OF WASTE WATER FROM DYEWORKS (IN FRENCH),
E. Leclerc.
Bulletin du Centre Belge d'Etude et de Documentation des Eaux, No 23, p 39-51, 1954.

Descriptors: *Cotton, *Waste water treatment, *Sedimentation, *Pollution abatement, Biological oxygen demand, Solid wastes, Fish conservation.
Identifiers: *Dyehouse wastes, *Linen, Waste water analysis, Sizing wastes, Bleaching waste, Desizing, Textile mill wastes.

The characteristics of the various types of waste waters from the textile industry are described and methods of treatment are reviewed. Preliminary studies of the waste waters for works engaged in the bleaching and sizing of cotton and linen are reported. The effluent is settled in fiber sedimentation tanks in series before discharge at a rate of 550 cu m/hr to the river Lys. Analysis of samples taken from the spillway to the river revealed no significant variations in the character of the effluent. During the day the effluent satisfies the condensation for discharge to a third-class (industrial) river in every way except that the amount of settleable solids slightly exceeds the limit. The waste waters become reoxygenated in the first sedimentation tank. Sedimentation reduces the BOD of the waste waters from 270 mg to 111 mg/liter. The BOD of the river water is increased by 20% by the discharge of the effluent; it is already heavily polluted at this point by other trade waste waters. (Livengood-North Carolina State)

WASTE WATER REUSE,
New York State Department of Health, Albany.
Donald B. Stevens.

urnal of the Water Pollution Control Federation, ol 40, No 4, p 677-683, April 1968. 2 fig, 1 tab, ref.

escriptors: *Water reuse, *Tertiary treatment, aste water treatment, Groundwater, Recharge lls, Injection wells.

hile New York State is a comparatively water h state it must provide a high degree of treatnt to its waste water simply because every eam is a source of water supply. The present te of the art is such that a water meeting drinking ter standards can be produced from the usual n of domestic waste waters. Emphasis must shift m the mere removal of pollutants from the mainam of waste water to satisfactory disposal of s removal material. Two current studies are scribed in regard to the replenishment of groundter well supplies. It is estimated that by the year 77, the groundwater supply will be exceeded by e demand and rain alone will not be able to plenish the source. Plain I (Nassau County) is to gment the groundwater supply and simultanesly provide a hydraulic barrier to prevent salt ter intrusion. Plan II (Long Island) provides for rtiary treatment which will produce an effluent at meets the drinking water standards. The cond plan is also to be used for groundwater intion. (Hancuff-Texas)

EW PROCESS TO REMOVE PHENOLS FROM ASTE WATER,
umble Oil and Refining Co., Houston, Tex.
illiam L. Lewis.
urnal of the Water Pollution Control Federation, ol 40, No 5, Part I, p 869-872, May 1968. 3 fig.

escriptors: *Phenols, *Recovery, *Emulsions, Instrial waste, Waste water treatment, Costs, Oil, ochemical oxygen demand, Distillation.
entifiers: *Extraction, Catalytic cracking, ydrocarbons.

process to extract phenols from catalytic acking distillate water recently was developed by umble Oil and Refining Company. With a 12- x 0-ft electrostatic treating drum, this extraction chnique can reduce the phenol content of catacker distillate water up to 90%. The water eated, condensate distillate water, usually conins more than 300 mg/l of phenols. Because of e volume of condensate water normally is 5 to 5% of the hydrocarbon distillate volume, the total henols in the effluent water stream can amount to veral hundred pounds per day. By thoroughly ixing the distillate water with cycle oil and then lowing the emulsion to separate, the phenol partions itself between the two emiscible liquids with ost of it transfering to the hydrocarbon phase. his transfer is enhanced by a stimulated random otion of water particles brought about by a 0,000- to 40,000-volt potential. The installed cost f the device was less than $200,000. (Hancuff-exas)

LAND RECLAMATION--A COMPLETE SOLUTION OF THE SLUDGE AND SOLIDS DISPOSAL PROBLEM,
Metropolitan Sanitary District of Greater Chicago, Ill.
Frank E. Dalton, Jerome E. Stein, and Bart T. Lynam.
Journal of the Water Pollution Control Federation, Vol 40, No 5, p 789-804, May 1968. 14 fig.

Descriptors: *Sludge disposal, *Land reclamation, Sludge, Activated sludge, Costs, Fertilizers, Lagoons, Nitrogen, Phosphorus, Research and development, Illinois.
Identifiers: Wet air oxidation, Chicago (Ill), Solids.

The West-Southwest plant of Chicago handles approximately 825 tons/day of solids. In order to handle this load 4 methods are used: (1) heat dried activated sludge producing approximately 435 tons/day, (2) wet air oxidation process approximately 145 tons/day, (3) heated digesters, 100 tons/day, and (4) Imhoff tank sludge 145 tons/day. To this should be added 90 tons/day from the Calumet plant making a total of over 900 tons/day of sludge on a dry basis. The solids disposal cost is approximately 14.5 million dollars per year, or 46% of the annual maintenance and operation budget. A proposed land reclamation plan satisfying the following criteria is reviewed. (1) It must meet environmental standards, no air or water pollution, (2) it must solve the problem into perpetuity, (3) the method should be economical, and (4) the organic matter should be conserved for beneficial use. Implementation of the reclamation plant requires research and careful planning. Of special interest is that portion of the plan for liquid as well as solid disposal. Some areas utilizing waste for land reclamation are documented. (Hancuff-Texas)

DESIGNS OF A MODERN MEAT PACKING WASTE TREATMENT PLANT,
Giffels and Rossetti, Inc., Detroit, Mich.; and Florida State Board of Health, Jacksonville.
E. Willoughby, and V. D. Patton.
Journal of the Water Pollution Control Federation, Vol 40, No 1, p 132-137, Jan 1968.

Descriptors: *Industrial waste, *Waste water treatment, *Design, Operation and maintenance, Costs, Activated sludge.
Identifiers: *Meat packing, Loading.

A brief description is given of the in-plant actions taken to eliminate the sources of pollution through their reclamation. For example, all the viscera, horns, hooves, and other inedibles were hashed and cooked, and the grease reclaimed. The process chosen for the unreclaimable portion of the wastes was extended aeration modification of activated sludge. The basic components of the system as designed and installed include a sedimentation and grease skimming facility, extended aeration, and aerobic digestion. The aerobic digestion system consists of two aeration tanks and an aerobic tank, final settling tank, with an air-lift sludge return system, 5-acre aerobic stabilization pond, multistage air compressor facility, chlorination facility, and detention pond. Testing of composite samples over a month period indicated that: (1) the biological load was about equal to the design load of 2,000 lbs. BOD per day, (2) the hydraulic load was about 160% of the design basis of 315,000 bal/day, (3) BOD removal averaged 95%, (4) suspended solids removal averaged 84%, (5) Settleable solids removal averaged 98%, (6) grease removal averaged 98%. Total cost of the facility was about $250,000. (Hancuff-Texas)

HYDRAULIC MODEL STUDIES OF CHLORINE MIXING AND CONTACT CHAMBERS,
Harza Engineering Co., Chicago, Ill.
David S. Louie, and Martin S. Fohrman.
Journal of the Water Pollution Control Federation, Vol 40, No 2, Part 1, p 174-184, Feb 1968. 6 fig, 3 tab.

Descriptors: *Chlorination, *Model studies, Mixing, Design, Flow profiles, Head loss, Baffles, Costs.
Identifiers: Diffusers, Detention time.

Because of the size and cost of the proposed postchlorination facility for Metropolitan Sanitary District of Greater Chicago (330 MGD) it was decided that an extensive model study would be desirable. The scale finally decided upon was 1 to 10, and because of the physical largeness of the model, results were considered to be more reliable than usually could be extrapolated from a model to prototype. Since the prototype was to consist of two symmetrical batteries it was necessary to model only one half of the prototype. Confetti and dye were used for visual observation of mixing in the mixing chamber and distribution of flow in the contact chamber. Five basic contact chamber schemes were tested for their comparative performances from the standpoint of flow patterns, head loss, and detention time. The results of the study on the mixing chamber and diffuser system provided an effective means of evaluating the methods of introducing and mixing chlorine with the plant effluent. The most efficient design for the contact chamber was a van-baffle system. The scheme was superior for the following reasons. (1) It had lowest head loss of all the schemes studied. (2) It had the highest minimum and mean detention time. (3) It was the most desirable of all schemes as regards sedimentation because of a more uniform flow pattern. (Hancuff-Texas)

FLOCCULATION OF BULKED ACTIVATED SLUDGE WITH POLYELECTROLYTES,
Northwestern Univ., Evanston, Ill.
Phillip C. Singer, Wesley O. Pipes, and Edward R. Hermann.
Journal of the Water Pollution Control Federation, Vol 40, No 2, Part 2, p R1-R9, Feb 1968.

Descriptors: *Activated sludge, *Flocculation, *Sphaerotilus, Sludge, Coagulation, Costs, Sewage treatment, Electrolytes.
Identifiers: *Bulking, *Polymer, Settling.

Bulk sludge can be flocculated and certain cationic polyelectrolytes are flocculants of bulk activated sludge. The optimum concentration for the two cationic polymers studied were found to depend on the initial sludge volume index and on the suspended solids content. The greater the suspended solids concentration, the greater was the polymer requirement, and the greater the final settled volume. As more polymer is added beyond the point of maximum flocculation, the floc becomes larger resulting in greater settled volume due to trapped water. The use of cationic polymers in flocculated bulk sludge resulted in the discharge of a clear stable effluent at dosages of between 2 and 3 mg/l. However, it was also found to be successful at a dosage of 50 mg/l. The treatment costs were: alum, $9.40/million gallons; cationic polymer A, $6.50/million gallons; cationic polymer B, $20.00/million gallons. Sludge once coagulated by a polymer seemed resistant to subsequent polymer coagulation during experiments of recycling of sludge. (Hancuff-Texas)

THE BIODEGRADABILITY AND TREATABILITY OF NTA,
Proctor and Gamble Co., Cincinnati, Ohio.
J. E. Thompson, and J. R. Duthie.

Journal of the Water Pollution Control Federation, Vol 40, No 2, Part 1, p 306-319, Feb 1968. 10 fig, 2 tab, 15 ref.

Descriptors: *Biodegradation, *Detergents, Activated sludge, Waste water treatment, Sewage treatment, *Laboratory tests, Degradation (Decomposition), Surfactants.
Identifiers: Trisodium nitrilo triacetate (NTA), Laboratory scale.

The use of NTA in combination with polyphosphates has been found to be effective as a detergent builder. As an ingredient in detergents, NTA becomes a component of waste water and therefore the biodegradability and treatability of NTA are of interest to the detergent industry and to others concerned with waste water treatment and water supply. The results of this study show that NTA is metabolised to carbon dioxide, water, and inorganic nitrogen by microorganisms present in waste water and river water; thus NTA is biodegradable. The biodegradation process is suggested as an initial cleavage and immediate metabolism of two acetate groups followed by metabolism of the glycine fragment. Measurements of oxygen utilization by microorganisms metabolising NTA indicate that carbonaceous oxygen demand was 59% of theoretical in 5 days, and 91% in 13 to 20 days. The rate and extent of NTA degradation was found to be comparable to those of glucose and citric acid. It was found to be removed from waste water by the activated sludge process, have no effect on primary and secondary settling, nor on sludge digestion, and would degrade rapidly when entering rivers or lakes. A zinc-zincon analytical method for the detection of NTA is presented in an appendix. (Hancuff-Texas)

SUBSTRATE UTILIZATION AND HIGH BIOLOGICAL SOLIDS CONCENTRATION,
Oklahoma State Univ., Stillwater.
P. Krishnan, and A. F. Gaudy, Jr.
Journal of the Water Pollution Control Federation, Vol 40, No 2, Part 2, p R54-R66, Feb 1968. 8 fig, 1 tab, 23 ref.

Descriptors: *Activated sludge, *Concentration (Composition), *Kinetics, *Degradation (Decomposition), Sewage treatment, Waste water treatment, Chemical oxygen demand, Adsorption, Carbohydrates, Sludge, Protein, Microorganisms, Metabolism.
Identifiers: *Biological solids, Warburg.

Laboratory-scale studies of batch activated sludge units with glucose and sorbitol as carbon sources showed that no relation existed between immediate uptake and initial solids concentration, for concentrations of 1,500 to 4,700 mg/l. It was observed in making studies with sorbitol and glucose and other studies in the laboratory, that during substrate removal using relatively high initial biological solids, most of the substrate is channeled into carbohydrate synthesis and that after this, protein is synthesized from the carbohydrate store, i.e., the two syntheses are observed to occur in essentially a sequential manner. The ability of high solids systems to remove substrate in the complete absence of protein synthesis is rigorously demonstrated by the experiment using chloramaphenicol. The results of the sorbitol experiments throw a particular light on the question of adsorption as a primary mechanism of substrate removal. No evidence for adsorption could be found, but additional evidence for the purely biochemical mechanism is put forth. (Hancuff-Texas)

EFFECTS OF AMINO ACIDS ON ANAEROBIC DIGESTION,
Texas Univ., Austin.
Ernest M. Miholits, and Joseph F. Malina, Jr.
Journal of the Water Pollution Control Federation, Vol 40, No 2, Part 2, p R 42-53, Feb 1968.

Descriptors: *Anaerobic digestion, *Amino acids, Digestion, Biomass, Waste water treatment.
Identifiers: *Warburg analysis, *Radioactive tracers, Substrate, Labelled, Removal, Laboratory scale.

In this study single non-radioactive amino acids, as well as labelled 1-C-14 amino acids were added to digested starch, and the effects of this compound on quantity and quality of gas production were recorded. Laboratory scale digestion units and manometric techniques were used in these studies. The results show that micromole quantities of leucine, methionine, alanine, glycine stimulate gaseous production of an anaerobic system. Normal parameters, pH, alkalinity, and volatile acid concentrations, all of which are rough parameters which tell nothing of the variations occurring in the microbial population in localized portions of the digester may fail to indicate actual performance, while amino acid concentration and gas production values may be more meaningful. (Hancuff-Texas)

USE OF COMPUTERS IN DESIGN OF SANITARY SEWER SYSTEMS,
Polytechnic Inst. of Brooklyn, N.Y.
P. R. DeCicco, H. F. Soehngen, and J. Takagi.
Journal of the Water Pollution Control Federation, Vol 40, No 2, Part 1, p 269-284, Feb 1968. 15 fig.

Descriptors: *Design, *Sewers, *Computers, Systems analysis, Data processing, Flow, Programs, Costs, Evaluation, Analysis.

The electronic computer techniques developed for the design of municipal sanitary waste water collection systems include linked programs for estimation of design flow, design of sewers, computation of partial flow characteristics, and estimate of costs. The system recently was applied to the design of Merrick Harbor Collection District system in Nassau County, New York, which has an area of about 5 sq.mi. and an ultimate population of 39,500. The programs are applicable to any area, regardless of size, topography, configuration, or other special characteristics. Inputs include basis for estimating design flows, sewer design criteria, demographic, topographic and geologic data and sewer layout requirements. The program also accepts information about potential obstructions and locates sewers to avoid interference. The computerized procedure improved both quality and quantity of output and released engineering personnel from routine computations. (Hancuff-Texas)

OPTIMIZATION OF THE HYDRAULIC REGIME OF ACTIVATED SLUDGE SYSTEMS,
Kansas State Univ., Manhattan.
Larry E. Erickson, and Liang-tseng Fan.
Journal of the Water Pollution Control Federation, Vol 40, No 3, p 345-362, March 1968. 14 fig, 3 tab, 22 ref. OWRR B-001-KAN.

Descriptors: *Activated sludge, *Mathematical model, *Hydraulics, *Optimization, Biological treatment, Sewage treatment, Costs, Economics, Waste water treatment, Aeration, Concentration (Composition), Efficiency.

The systems approach is taken to simulate and mathematically optimize a combination of process and economic models for activated sludge. Mathematical models are given for the growth kinetics of biological systems, hydraulics of completely mixed tanks in series, and economic considerations as capital and operating costs. A combination of the kinetic, hydraulic, and economic models is made and approached from a minimum cost standpoint. Several tables are presented giving design constants for various biological k rates for systems with 90 and 99% treatment. Mathematical optimization techniques can be used to obtain useful information about the activated sludge system. K1 a dimensionless organic nutrient concentration at which the specific growth rate is one half the maximum value is a very important variable in the design of an activated sludge system. The optimum allocation of volumes for two aeration tank activated sludge systems changes significantly with changes in K1. Results of analyses of completely mixed aeration tanks show that the theoretical volume requirement for an optimal 2 aeration tank activated sludge system is less than for a system of a single aeration tank. (Hancuff-Texas)

TECHNIQUES AND FACTORS INVOLVED IN AERATOR SELECTION AND EVALUATION,
Dow Chemical Co., Midland, Mich.
Rudy G. Novak.
Journal of the Water Pollution Control Federation, Vol 40, No 3, Part 1, p 452-463, March 1968. 11 fig, 2 tab.

Descriptors: *Oxygenation, *Aeration, *Equipment, Efficiency, BOD, Design, Industrial waste, Waste water treatment, Oxygen, Sewage treatment.
Identifiers: *Oxygen transfer, Mechanical aerators, Power, Uptake rate.

Oxygenating efficiencies of aerators measured during steady-state operation are not accurate enough to determine compliance with performance guarantee. Oxygenating efficiencies measured during steady-state operation are better indicators of relative performance than absolute performance. The absolute oxygenating efficiency of an aerator can be measured best by a study of individual aerator oxygenation performance under non-steady state operation in a basin sized to permit accurate determination of the required data. Two different types of aeration equipment were studied: a mechanical propellor-type mixer, and an ejection aeration system. Results from the mechanical aerator study showed that transfer under standard conditions was 4.1 lb O2/HP-hr and evaluation of the ejector showed a value of 4.3 lb O2/HP-hr. Oxygen uptake rates were determined by plotting Cs-C1 versus time for mixed liquor and pure water. From these KLA values were determined. Other parameters evaluated include chemical oxygen demand, biochemical oxygen demand, sludge volume index, suspended solids and mixed liquor velocity. Factors which must be considered in aerator evaluation were said to be basin configuration, fluctuating liquid levels, waste water solids, and alpha and KLA values. (Hancuff-Texas)

OXYGENATION EFFICIENCY OF A BLADED ROTOR,
Iowa State Univ., Ames.
John L. Cleasby, and E. Robert Baumann.
Journal of the Water Pollution Control Federation, Vol 40, No 3, p 412-424, March 1968. 8 fig, 18 ref.

Descriptors: *Oxygenation, *Rotors, Design, Pilot plants, Dissolved oxygen, Aeration, Concentration (Composition), Efficiency, Pressure, Temperature, Turbulence, Waste water treatment.
Identifiers: *Mechanical aerators, Diffusers, Power.

Increased use of many modifications of the activated sludge waste treatment process has focussed attention on the need for efficient aeration devices. The results of a study performed on a bladed rotor mechanical aeration device is reported. The oxygenation capacity at speeds of 60 to 120 RPM and rotor immersions of 3 to 12 inches ranged from 3.4 to 5.0 O2/HP-hr under standard conditions. The actual oxygenation capacity under standard conditions including the power required for motor, gear reducer, and rotor should be approximately 75% of the above values. Forty-five ex-

erimental runs were conducted covering five different rotor speeds and four different rotor immersions. Because of difficulty analyzing data reported n the literature for diffused aeration systems (reorted as a per cent oxygen absorption), the rotor tudies were compared with one typical hypothetial diffused aeration installation. The rotor system vas found to be much more efficient with the difused air system producing 0.81 lb O2/HP-hr. (Hancuff-Texas)

A NEW PRODUCT CONCEPT FOR IMPROVEMENT OF INDUSTRIAL WATER,
Du Pont de Nemours (E. I.) and Co., Wilmington, Del.
William T. Robinson, and Robert J. Mattson.
Journal of the Water Pollution Control Federation, Vol 40, No 3, p 439-446, March 1968. 9 fig, 6 tab, ref.

Descriptors: *Industrial waste, Membrane processes, Reverse osmosis, Waste water treatment, Efficiency, Biochemical oxygen demand, Concentration (Composition).
Identifiers: *Refractory organics, Fibers, Polymers.

Du Pont is conducting research on the potential application of polymeric membranes as a new process for industrial waste treatment. In many areas the largest advantage for using membrane separation technique is that materials which are pollutants at low concentrations may be reusable at higher concentrations. Results of a study on processes using small diameter hollow fibers are reported. The most common sizes range from 25 to 250 microns OD with wall thicknesses of 5 to 50 microns. The permeators used for study are 6 inches in diameter and have a length up to 7 feet. It is indicated that polymeric membranes differ in their ability to reject specific ions. An example is given whereby the chloride ion has 0% rejection and where the phosphate ion has 99%. Therefore, the possible degree of concentration would be much higher because the process would not have to work at a higher pressure to overcome the osmotic pressure of the chloride ions. Results of membrane rejection at 400 psig showed a COD reduction from 212 mg/l to 66, indicating a rejection of 69%. (Hancuff-Texas)

THE DISPOSAL OF NYLON WASTES,
Chemstrand Corp., Pensacola, Fla.
E. D. Remy, and D. T. Lauria.
Proceedings of the Industrial Waste Conference, 13th, 1959, p 596-624. 12 fig, 12 ref, 4 tab.

Descriptors: *Activated sludge, *Solvents, *Waste water treatment, Lagoons, Sedimentation, Flotation, Disposal, Streams.
Identifiers: *Nylon 66, Combusion, Adipic acid, Nylon salt, Solvent stripping, Man-made fiber plant wastes.

At the plant of Chemstrand Corporation near Pensacola, Florida, manufacturing nylon 66, the waste waters were formerly stored in lagoons and discharged to the Escumbia River during periods of high flow. When the plant was expanded, however, treatment of the waste waters became necessary. The more concentrated waste waters were burned to recover heat. Of the remaining waste waters, about 90% came from the manufacture of adipic acid, a principal component of nylon salt. Detailed studies were made on the treatment of these waste waters; the results are discussed, and shown in tables and graphs. It was found that one stream of adipic acid waste was best treated by solvent stripping, using a submerged combustion process. The stripped waste water could then be mixed with the second stream for biological treatment by the activiated sludge process. Sedimentation was found to be more effective than flotation for recovery of sludge. Based on the laboratory and pilot-plant studies, a full-scale treatment plant was put in operation in 1957 and has operated efficiently. (Livengood-North Carolina State)

TREATMENT OF WOOL SCOURING WASTES,
Worthen H. Taylor.
Sanitalk, Vol 1, p 13-14, 1952.

Descriptors: *Calcium chloride, Centrifugation, Turbidity, Suspended load, *Waste water treatment.
Identifiers: *Wool grease, *Wool scouring wastes.

This article relates to the treatment of wool scouring wastes by the addition of CaCl2 and centrifuging in a Sharples DG-2 centrifuge. This method resulted in a reduction of wool grease, turbidity, and suspended solids by 98-99 percent. The amount of CaCl2 used varied from 0.25 to 1.5 percent of the total weight of the wastes treated, the amount depending on the concentration of the wastes. However, wool scouring wastes resulting from the use of a minimum quanitity of water in scouring required less chemicals. The success of the process is adding the solution of CaCl2 three seconds before centrifuging and then holding the effluent in a skimming tank from 20 to 30 minutes. Temperature had little effect upon the process. (Livengood-North Carolina State)

BIOLOGICAL TREATMENT OF MIXTURES OF HIGHLY ALKALINE TEXTILE-MILL WASTE AND SEWAGE,
Cone Mills Corp., Greensboro, N. C.
R. H. Souther, and T. A. Alspaugh.
American Dyestuff Reporter, Vol 44, p 390-395, 1955. 1 fig, 10 tab, 7 ref.

Descriptors: *Sewage effluents, *Trickling filters, *Activated sludge, Biochemical Oxygen Demand, Color, Domestic wastes, Pilot plants, Waste water treatment, *Biological treatment.
Identifiers: *Textile mill wastes, Alkaline wastes, Finishing wastes, Dyehouse wastes.

Pilot plants studies are being made on the treatment of mixtures of domestic sewage and textile-mill dye and finishing wastes by high-rate trickling filters, by activated sludge, and by chemical treatment to determine the most economical and most efficient method for treating such a mixture. Results indicate that pretreatment through a trickling filter and subsequent treatment through activated sludge is the most efficient method and can be satisfactorily used for treating highly alkaline textile wastes. An usually high removal of BOD and color is obtained. Certain process changes in the plant were also made to reduce the BOD loading through the treatment plant. (Livengood-North Carolina State)

PURIFICATION OF THE SEWAGE WATERS FROM RAYON MANUFACTURING (IN RUSSIAN),
V. S. Morgenshtern, Ya. Z. Sorkin, Yu. E. Matuskov, and V. A. Malikov.
Khimicheskie Volokna, Vol. 1, p44-47, 1966. 1 fig, 3 tab.

Descriptors: *Lime, *Waste water treatment, Sulfates, Sodium sulfate, Sulfides, Cellulose, *Chemical precipitation, Surface waters, Setting basins, *Effluents.
Identifiers: *Textile wastes, Sulfuric acid, Zinc compounds, Carbon disulfide, Grease, Rayon (Regenerated cellulose fibers), Regeneration, Baths, Clarifying agent, Suspended residues, Contact clarifier, Soda, Sodium sulfide, Staple fibers.

Waste waters containing sulfuric acid, corrosive nitrogen compounds, sulfates of sodium and zinc, carbon disulfide, hydrogen and other sulfides, thiocarbonates, cellulose pulp, and grease result from rayon manufacturing. Today viscose rayon plants use regeneration of the plastification, and precipitation baths to reclaim chemicals and to clean wastes to meet regulations protecting surface resevoirs. Lime is used as a reagent in a two-stage scheme of purification. Settling tanks or clarifying agents handle suspended residues and a contact clarifier guarantees removal of zinc from the effluent. Soda and sodium sulfide are used to regenerate zinc from effluents of the manufacture of high-strength rayon tirecord and staple. (Lonon - North Carolina State)

A DYNAMIC MODEL OF THE ANAEROBIC DIGESTION PROCESS,
Clemson Univ., S.C. Dept. of Environmental System Engineering.
John F. Andrews.
Proceedings of the Industrial Waste Conference, 23rd, 1969, p 285-310. 18 fig, 1 tab, 31 ref.

Descriptors: *Anaerobic digestion, *Simulation analysis, *Inhibition, *Hydrogen ion concentration, *Mathematical model, Anaerobic bacteria, Laboratory tests, Waste water treatment.
Identifiers: *Volatile acid concentration, *Process stability.

Process stability has been the major problem associated with the anaerobic digestion process. A dynamic model which utilizes an inhibition function to predict the failure of an anaerobic digester was presented. The key features of the model were: (1) the use of an inhibition function to relate volatile acid concentration and specific growth rate for the methane bacteria; and (2) consideration of the un-ionized acid as the growth-limiting substrate and inhibiting agent. The consideration of the un-ionized acid as the inhibiting agent resolves the conflict between volatile acid inhibition and pH inhibition because the concentration of un-ionized acid is a function of both total volatile acid concentration and pH. The model was kept as simple as possible by assuming that there was no lag phase, organism death, endogenous respiration, substrate utilization for maintenance energy, or inhibition byproducts. Experimental evidence from laboratory studies and evidence from the bacteriological literature were presented in support of the model. Simulation studies, utilizing a digital-analog simulation program (PACTOLUS), of both batch and continuous flow systems provided additional evidence by predicting results commonly observed in the field during the start-up, or failure, or recovery of anaerobic digesters. The simulation studies should be considered as only semiquantitative as reliable values of the growth parameters were not available. (Galwardi-Texas)
W70-07804

ANNUAL DIGESTER UPSET CORRECTED,
San Mateo Waste Water Treatment Plant, Calif.
John P. Lee.
Water and Sewage Works, Vol 116, No 2, p 56-58, Feb 1969. 1 fig, 3 tab.

Descriptors: *Anaerobic digestion, *Operation and maintenance, *Waste water treatment, Hydrogen ion concentration, Lime, California, Activated sludge, Sludge digestion.
Identifiers: *Volatile acids, Carbon dioxide, Gas production, San Mateo (Cal).

San Mateo, California has experienced three identical primary sewage digester upsets in the past three years at its municipal waste water treatment plant. The primary digester handles approximately 20,000 gallons of thickened sludge per day. The upsets were characterized by (1) an increase in the volatile acid content of the digester, (2) an increase in the carbon dioxide fraction of the gas produced and (3) a dramatic decrease in gas production.

Operational data were presented for the periods just before, during and after correction of the upsets for each of the three years. For instance, volatile acid content increased from 108 to 2070 mg/l while CO2 increased from 27 to 43 and gas production decreased from 91,600 to 47,200 cu. ft. during the upset of 1966. The breaking up of the grease blanket on the top of the digester at the start of warm weather increased the activity of the acid-forming bacteria. Control of the upsets was obtained by the addition of up to 600 pounds of lime and the diversion of the raw sludge to the secondary digester. (Galwardi-Texas)

START-UP PROBLEMS AT A METROPOLITAN DISTRICT PLANT,
Metropolitan Denver Sewage Disposal District No. 1, Commerce City, Colo.
Louis D. Kifer.
Journal of the Water Pollution Control Federation, Vol 40, No 7, p 1338-1345, July 1968.

Descriptors: *Sewage treatment, *Operations, *Failures, *Equipment, Control systems, Waste water treatment, Sludge disposal, Chemicals, Incineration, Pumps, Irrigation, Personnel.
Identifiers: *Blowers, Suspended solids, Air flow, Start-ups.

The large number of start-up problems encountered at the Metropolitan Denver Sewage Treatment Plant in Colorado are described. The plant includes primary treatment for part of the wastes and activated sludge for treating both these and wastes given primary treatment elsewhere. Initial start-up problems included foam build-up on the primary tanks due to clogging of the foam dispersion spray system (cured by utilizing secondary effluent in place of primary). All four blowers of the plant failed within 74 hours after the start of operation. This was due to the veins pulling away from the main portion of the wheel, resulting in stricking the casing. After the second start-up further problems developed. These included improper hydraulic control of the aeration tanks; deposition of oil fractions in the control system; air drops due to leaking at knee joints, caked grease in the tank due to underdesign of pumps; difficulty in furnishing adequate volumes of sludge to the vacuum filters; and further problems in sludge conditioning, drying, incineration and further difficulties in blower operation. (Hancuff-Texas)

CENTRAL PRE-TREATMENT OF OMAHA PACKING HOUSE WASTE WATERS,
Omaha Dept. of Public Works, Nebr.
E. Bruce Meier, and William E. Korbitz.
Journal of the Water Pollution Control Federation, Vol 40, No 4, p 627-636, Apr 1968. 10 fig, 1 tab.

Descriptors: *Industrial waste, Waste water treatment, Design, Sedimentation, Financing, Profit, Costs, Farm wastes, Livestock wastes, Cattle, Hogs, Sheep.
Identifiers: *Meat packing, Flotation, Solids, Collection, Fats, Greases, Processing.

The daily kill day discharges of waste water from the meat packing operations in the City of Omaha average more than 15 million gallons and contain at least 70 dry tons of suspended solids in addition to approximately 25-40 dry tons of animal fat. The suspended solids are predominantly kill floor scraps and paunch manure from cattle, hogs and sheep. The simple and inexpensive method of paunch manure and grease disposal by sluicing from the premises is no longer acceptable. The difficulty of owning and operating privately 18 separate facilities would be difficult if not impossible. The City and industry joined hands in an effort to find an economically feasible solution. The final solution involved the design of collector sewer systems, gravity settling basins, conventional dewatering and conveying facilities, air flotation units, solids and skimmings storage, and a continuous dehydration system for skimmings using oil as a process vehicle. The pre-treated waste water will be discharged to the city sewers. Total estimated cost of the Omaha plant is 6.7 million dollars and will be financed chiefly by bonds. The bonds will be funded from revenues derived from the sale of processes grease recovered from the two-stage facility, and by payments from individual packing companies. (Hancuff-Texas)
W70-07807

SUBSTRATE UTILIZATION IN HETEROGENOUS COMMUNITIES,
Harvard Univ., Cambridge, Mass.
Elisabeth Stumm-Zollinger.
Journal of the Water Pollution Control Administration, Vol 40, No 5, Part 2, p R213-R220, May 1968. 4 fig, 4 tab, 25 ref.

Descriptors: *Microorganisms, *Biodegradation, *Cultures, Bacteria, Natural streams, Activated sludge, Growth rates.
Identifiers: *Heterogenous systems, Glucose, Consumption, Substrate utilization.

Mixed laboratory cultures growing on non-selective multi-substrate medium do not simulate satisfactorily a natural bacterial population because accumulation leads to selective enrichment of one or several types. A mixed acclimated laboratory culture resembling a natural community in kind and relative abundance can be reconstituted from pure cultures of natural isolates. The slowly growing bacteria of natural waters can utilize many substrates concurrently, but sequential substrate utilization can occur where a few substrates predominate in solution enriching the microorganisms favored by these substrates. Sequential substrate utilization was observed in coliform dominated cultures. (Hancuff-Texas)

PRETREATMENT OF SEWAGE SLUDGE,
Technische Hochschule, Aachen (West Germany). Institut fuer Siedlungswasserwirtshaft.
B. Boehnke.
4th International Congress of the IRGR, (International Research Group on Refuse Disposal) Based, 2-5 June 1969, working group 5, p 608-614. 1 fig, 1 tab.

Descriptors: *Sludge, *Sludge disposal, *Sludge treatment, *Sewage sludge, *Sewage disposal, *Sewage treatment, *Sludge digestion, Aerobic treatment, Anaerobic digestion, Dewatering, Drying, Filtration, Vacuum drying, Centrifugation.
Identifiers: *Sludge pre-treatment, Aerobic digestion.

Solid waste and sludge production in West Germany amount to some 50 x 10 6m3 per year, of which 40% or 20 x 10 6m3 is raw, unthickened sewage sludge. With increasing population and decreased agricultural use of sewage sludges as fertilizer, new methods of treatment and disposal must be found. Methods of disposal acknowledged by experts include incineration, composting, and tipping (sanitary landfill). Sludge processing must fulfill two basic requirements. (1) The sludge must be stabilized through decomposition of high value proteins and carbohydrates into low valued ones. (2) volume must be reduced by removal of ballast water. The 20 x 10 6m3 sludge produced yearly in West Germany, if treated anaerobically and dried to 60% water, could be reduced in volume to 2.4 x 10 6m3 of a paste-like material and easily stored. Dehydration to 60% water yields a tenfold disposal volume, but further dehydration to 40% water content increases disposal volume only another 50%. Further reduction in water content is uneconomical. Dehydration may be acheived by centrifugation or filtration. Both processes are discussed briefly. (Makela-Texas)

CHEMICAL PROCESSING OF WASTE WATE FOR NUTRIENT REMOVAL,
Stanford Univ., Calif.
Rolf Eliassen, and George Tchobanoglous.
Journal of the Water Pollution Control Federatio Vol 40, No 5, Part 2, p R171-R180, May 1968. fig, 4 tab, 9 ref.

Descriptors: *Nutrients, *Nitrogen, *Phosphoru *Waste water treatment, *Costs, Chemicals, Ab sorption, Chemical precipitation, Electro-dialysi Disposal, Efficiencies, Ion exchange, Sewage trea ment.
Identifiers: *Methods, Removal.

Nutrient removal methods can be classified a biological, chemical and physical. Chemica methods for the removal of nitrogen include; am monia stripping, ion exchange, and electro-chem cal treatment. Chemical precipitation, io exchange, sorbtion, and electro-chemical trea ment are also available for removal of phosphorus Typical removal efficiencies are 80-98% nitroge and 85-99% for phosphorus. The key factors i planning and designing nutrient removal facilitie are the nutrients to be removed, the use of treate waste water, means for ultimate disposal of con taminants, and economic feasibility. Costs for dif ferent processes vary widely. For example, so spreading varies between $0.001 to $0.3/1000 ga While deep-well injection varies between $13 an $27/1000 phosphorus removal varies between $4 and $70 per million gal. (Hancuff-Texas)

THE TREATMENT OF KIER LIQUOR IN AD MIXTURE WITH SEWAGE,
Sewage Works, Saddleworth (England).
K. A. Deighton.
Water Pollution Control, Vol. 66, No. 5, p 484 491, 1967. 8 tab.

Descriptors: *Activated sludge, *Waste wate treatment.
Identifiers: *Textile mill wastes, *Pulp mill wastes Caustic liquor, Kier process.

The Greenfield, Lancaster, England sewage disposal system was quite capable of handling the trade waste from the area, including some textile mills and dye houses until a cigarette paper purifying plant was built. Studies showed that the caustic liquor from the kier boiling of pulp would over load it. Laboratory and pilot plant experiments developed methods and modifications in the sewage plant. It was found that sewage containing kier liquor and other trade effluents could be suc cessfully purified by two-stage treatment using a partial-treatment activated-sludge plant followed by biological filtration. While no set of conditions ensured a 30:20 effluent at all times, departure from this were generally slight. On average, during the later stage of the experiment, effluents were within the 30:20 standard. (Work - North Carolina State University)

Descriptors: *Mixing, *Activated sludge, *Microorganism, Dissolved oxygen, Sewage treatment, Biological treatment, Sludge, Laboratory scale, Waste water treatment, Chemical oxygen demand, Biological oxygen demand, Turbulance, Bacteria.
Identifiers: *Agitation, *Compositions, RNA, DNA.

Operation of a steady-state bacterial system at a constant dilution rate with varying agitation rates has shown that solids yield and oxygen uptake both

with the amount of agitation provided. As a sure of agitation, the average velocity gradient as measured. The decrease in solid yield with easing turbulance appears to occur primarily at expense of cellular carbohydrate. This results in production of a sludge having a higher protein tent at a higher agitation rate. On the basis of ature cited, and work presented five hanisms are advanced to explain the increased gen uptake and decrease in solids yield. These (1) change in predominance, (2) increased uency of contact between cells and substrate, production of smaller floc particles with ltant improved penetration of substrate and ox-n, (4) increase in the rate of oxygen transfer ss cell liquid interfaces, (5) maintenance of a er DO concentration with increasing turbu-e. Although none of these mechanisms can be inated, the increased oxygen uptake probably lts from the reduction in the cell liquid interfa- resistance to oxygen transfer with increase of ing energy and decrease in the biological solids d probably results from an increased ratio of iration to synthesis. SIGN AND OPERATION OF THE FIRST GESTER GAS TURBINE IN THE U.S.A.,
ollo (John) Engineers, Lafayette, Calif.
Harvey Hunt, and William N. Clarke, Sr.
rnal of the Water Pollution Federation, Vol 40, 7, p 1346-1357, July 1968. 4 fig.

criptors: *Turbines, *Digestion, *Fuels, dge, Waste water treatment, Costs, Operations, ign, Sewage treatment, Sludge digestion.
ntifiers: *Power generation, *Gas turbine en-e.

e gas turbine now in operation at the County itation Districts of Orange County, California, he first in the United States and the second in world to utilize waste digester gas as a fuel. The er presents the thinking and decisions which d to the turbine system's design, installation and ration. The turbine generator is suited ideally peaking and stand-by power generation as it is necessary to start a boiler and wait for steam eration before power can be produced. Also the bine requires much less space than the diesel en-e. The unit is light weight and can produce 70 to 0 kilowatts of electrical energy per ton of total chinery as compared to 27 kilowatts per ton h the diesel engine. One of the biggest ad-ntages of the gas turbine is that no water is ded for either cooling or power, with the excep-n of water required to cool the gas. The turbine rchased is a dual fuel type rated at 1080 owatts, and drives a synchronous brushless alter-ing current generator rated at 1000 kilowatts. e exhaust gas from the turbine passes through a at recovery unit which has a steam capacity rat-of 12,500 pounds per hour. The steam from this t drives a steam turbine which in turn drives a 0 kilowatt induction generator. The initial cost the above equipment was $250,000. Cost for in-llation was $261,000. FECT OF PRIMARY EFFLUENT SPENDED SOLIDS AND BOD ON AC-VATED SLUDGE PRODUCTION,
and Rapids Water Pollution Control Plant, ch., and Dow Chemical Co., Midland, Mich.
ris Voshel, and J. G. Sak.
rnal of the Water Pollution Control Federation, l 40, No 5, Part 2, p R203-R212, May 1968. 8 , 3 tab, 10 ref.

scriptors: *Activated sludge, *Biochemical ox-en demand, *Operation, Costs, Sewage treat-nt, Chlorine, Waste water treatment, Sedimen-ion.
ntifiers: *Suspended j solids, *Concentration, r supply, Grand Rapids, Michigan, Polymers, occulation.

The Grand Rapids Water Pollution Control Plant was constructed in 1929, and consisted of a primary plant only. In 1953 the plant was expanded to include the activated sludge process, and again in 1958 it was further expanded. The primary effluent suspended solids level was observed to have a major influence on the total weight of excess sludge production. The primary effluent suspended solids can be controlled by addition of an organic flocculant to the raw waste water stream. Approximately 1 mg/l of anionic polymer was added to the raw waste water ahead of the grit channel. Little flocculation occurred in the grit channel, but turbulence at the proportional weirs of the channel exit provided excellent mixing. The resulting flocculation removed a greater portion of BOD than is removed normally across the primary clarifier. Additional removal of suspended solids and BOD across the primaries resulted in reduction of extra sludge. Primary effluent suspended solids dropped from 112 mg/l to 45 mg/l. The primary effluent BOD dropped from 77 mg/l to 54 mg/l. Excess activated sludge production was reduced from 34,000 lbs/day to 13,500 lbs/day. Savings in the plant operating costs resulted from reduction of aeration air requirements, decrease in chlorine demand and improved filterability of the sludge. The final effluent quality also improved. (Hancuff-Texas)

DECOMPOSITION OF PYRUVIC ACID,
Bureau of Sewers, Baltimore, Md.
C. E. Keefer, and H. Watkins.
Journal Water Pollution Control Federation, Vol 40, No 5, Part 2, p R230-R234, May 1968. 3 fig, 2 tab, 1 ref.

Descriptors: *Anaerobic conditions, *Degradation (Decomposition), Digestion, Sludge, Methane, Waste water treatment, Sewage treatment.
Identifiers: *Pyruvic acid, *Volatile acid.

The results of three experiments investigating the decomposition of pyruvic acid seeded by digested sludge are shown. In the first experiment pyruvic acid additions amounting to 1.5% of the dry volatile solids in the sludge were made for a period of 28 days. The pH varied from 7.64 to 8.09 volatile acids ranged from 995 to 1407 mg/l, and gas production averaged 513 ml/g of acid added. Methane gas production varied between 40.3 and 48.7%. This was followed by a 7-day period in which acid additions were increased to 3.5% of the dry volatile sludge solids, which in turn was followed by an increase to 5.5%. With the increases in feed there was marked decrease in pH and a marked increase in volatile acids. The same tests were run on two additional sludges. (Hancuff-Texas)

MODELING AND OPTIMIZATION OF STEP AERATION WASTE TREATMENT SYSTEMS,
Kansas State Univ., Manhattan.
Larry E. Erickson, Y. S. Ho, and L. T. Fan.
Journal of the Water Pollution Control Federation, Vol 40, No 5, Part 1, p 717-732, May 1968. 6 fig, 2 tab, 5 ref.

Descriptors: *Mathematical models, *Activated sludge, *Kinetics, Optimization, Mixing, Aeration, Sewage treatment, Waste water treatment.
Identifiers: *Step aeration, Growth, Sludge flow, Completely mixed.

Several flow systems for use with the step aeration process have been examined under optimal operating conditions. These systems include several completely mixed tanks in series, several plug flow systems, and a composite system composed of a completely mixed aeration tank and a plug flow aeration tank. After making simplifying assumptions the optimum operating conditions were determined using a discrete version of the maximum principle. The optimization studies show that allocation of feed along the system is desirable under the conditions that are considered in this study. In other words, the step aeration system is theoretically desirable in some types of operating situations. The study also shows how to determine the optimum allocation and the optimum tank volumes for a given type of step aeration system. When all the systems that were considered are compared, the plug flow system with continuous feed allocation along it minimizes the required volume. The mathematical model used was developed based on certain simplifying assumptions and is considered only an approximation of the complex treatment process. (Hancuff-Texas)

BIOLOGICAL CHEMICAL COMBINATION DRAMATICALLY CUTS TREATMENT COSTS,
Ben Davis, and Syd Love.
Water and Pollution Control, Vol 107, No 5, May 1969. p 35-37. 3 fig.

Descriptors: *Biological treatment, *Waste water treatment, *Sewage treatment, *Chemical precipitation, Biodegradation.
Identifiers: Cyanide, Kukland Lake (Ontario).

The community of Kukland Lake, Ontario, produces a high volume of very weak sewage due to excessive infiltration and running of water taps in winter to prevent freezing. In 1965, it was decided to treat this waste and an investigation was initiated. Two hour settling tests yielded 25% BOD removal and 31% SS removal, and showed primary treatment alone would be insufficient. A biodegradability study showed a bulking sludge due to the presence of a toxic substance later identified as cyanide in concentrations of 0.04-0.80 mg/l. In the absence of the cyanide, it was expected contact stabilization would work, but the dilute nature of the sewage would inhibit sludge development. A coagulation study using jar tests resulted in 85% reduction in BOD and suspended solids (SS) at a cost of 2.0-2.5 cents per 1000 gallons. A pilot plant was built and yielded 85% SS removal and 60% BOD reduction with chemical dosages of 8 mg/l lime, 28 mg/l alum and 0.5 mg/l Dow Purifloc A-21, an anionic copolymer. Since BOD removal could not be increased above 60%, a combination chemical-biological pilot plant was tried. With chemical dosages of 20 mg/l alum added directly to the aeration tank Dow A-23 anionic copolymer added to the mixing compartment, a BOD reduction of 83% and SS removal of 90% was achieved. The effluent BOD was consistently less than 24 mg/l. (Makela-Texas)

A PREDICTIVE MODEL FOR THE DESIGN OF FLUID BED ADSORBERS,
Michigan Univ., Ann Arbor.
Thomas M. Keinath, and Walter J. Weber, Jr.

Journal of the Water Pollution Control Federation, Vol. 40, No. 5, p 741-765, May 1968. 14 fig, 1 tab, 29 ref.

Descriptors: *Activated carbon, *Design, *Columns, *Mathematical models, Adsorption, Waste water treatment, Organics, Mass transfer, Diffusion, Reclamation, Reuse, Herbicides, Beds, Depth.
Identifiers: *Fluid bed, Concentration.

A mathematical model describing mass transfer rates for organic pollutants in fluid bed adsorbers is presented. The model has been found to predict adequately the concentration time profiles for systems in which liquid flow rate, particle size of adsorbant, solute concentration, and depth of bed have been varied. Good agreement between experimental data and predicted adsorption behavior is demonstrated. Prediction of the breakthrough curves has been facilitated by measurement of specific adsorption and mass transfer parameters and simple batch-type systems. Because determination of film diffusion controlled mass transfer coefficients is not possible with rapidly agitated batch-type systems, these values have been obtained from generalized correlation of a transfer factor j with the systems specific parametric group (NR/NGA). Conversely, internal diffusion controlled mass transfer coefficients have been determined in non-flow systems and have been shown to be less important than external diffusion control kinetic parameters in determining the overall rate of mass transport. It appears reasonable that the model can be extended to prediction of concentration time profiles for each component of a complex mixture of pollutants. (Hancuff-Texas)

RECOVERY OF CYANIDES BY MODIFIED SERFASS DISTILLATION,
Federal Water Pollution Control Administration, Grosse Ile, Mich.
Charles T. Elly.
Journal of the Water Pollution Control Federation, Vol. 40, No. 5, p 848-856, May 1968. 1 fig, 7 tab, 5 ref.

Descriptors: *Chemical analysis, *Distillation, *Industrial waste, Waste water treatment.
Identifiers: *Cyanides, *Detection, *Determination, Recovery, Serfass distillation.

A significant improvement of simple and complex recovery is developed through a modification of a standard method for determining cyanides. The modified method is effective for measuring cyanide from 0.01 mg/l to higher concentrations of over 1 mg/l. The method is effective for detecting the number of complex cyanides as well as cyanide in domestic and industrial waste water and river water. The proposed method works on nearly all types of samples encountered. The modification which prevents the formation of complex mercuric cyanide ion consists of adding 10 ml of mercuric chloride and 30 mg of magnesium chloride to the standard Serfass method. CONSIDERATIONS IN DIGESTED SLUDGE ELUTRIATION,
Canadian-British Engineering Consultants, Ltd.
T. G. Scott.
Water and Pollution Control, Vol 107, No 10, p 419, October 1969.

Descriptors: *Sludge disposal, *Sludge treatment, *Filtration, Anaerobic digestion, Lime sewage treatment, Waste water treatment.
Identifiers: *Elutriation, Vacuum filtration, Ferric chloride, Spent pickle liquor, North Toronto.

The elutriation process was considered in solving the problem of sewage sludge disposal. The elutriation tank at the North Toronto Sewage Treatment Plant was fitted with a thickener mechanism. Plant effluent was used as elutriation wash water and mixed with the digested sludge in ratios varying from two to one, to eight to one. Satisfactory filtration was obtained on the vacuum filter using both a chemical dosage of ferric chloride at the rate of 4% by weight of the solids filtered along with 6.5% lime and spent pickle liquor along with 10% lime. A substantial reduction in conditioning chemical demand by the removal of as much as 80% of the digested sludge alkalinity was noted. Problems of filtrate disposal were also eliminated as the filtrate was returned to the elutriation tank. (Galwardi-Texas)

SIMPLIFIED AUTOMATED VOLATILE FATTY ACIDS ANALYSIS,
National Inst. for Water Research, Pretoria (South Africa).
J. E. Harwood, and D. J. Huyser.
Water Research, Vol 2, No 10 p 631-636, October 1968. 2 fig, 1 tab, 3 ref.

Descriptors: *Chemical analysis, Laboratory tests, Anaerobic digestion, *Automation, *Analytical techniques, Waste water treatment, Sewage treatment.
Identifiers: *Volatile fatty acids, *Manifold design, Pretoria, South Africa.

A method is proposed for the automated determination of the total volatile fatty acid content of aqueous samples. The manifold used in the proposed method is simpler and the method quicker than existing procedures. The long mixing coils used for mixing two reagent streams before addition to the sample streams are omitted. A flow diagram of the manifold is presented. Sampling speeds have been increased from 10 to 15 samples/hr to 30 to 40 samples/hr at a 1:2 sample/wash ratio. A steadier base-line is obtained using the simplified manifold. No special preparation of the reagents is required. Accuracy is improved by introducing the determination of a sample blank, which makes allowances for any natural color introduced by the sample itself. A comparison of manual and automatic analyses with and without blank correction is presented. (Galwardi-Texas)

SOILS SYSTEMS FOR LIQUID WASTE TREATMENT AND DISPOSAL: ENVIRONMENTAL FACTORS,
Robert A. Taft Water Research Center, Cincinnati, Ohio.
Warren A. Schwartz, and Thomas W. Bendixen.
Journal of the Water Pollution Control Federation, Vol. 42, No. 4, p 624-630, April 1970. 8 tab, 4 ref.

Descriptors: *Liquid wastes, *Groundwater, Waste water treatment, Biological treatment, Disposal, Chemical oxygen demand, Temperature, Depth, Vegetation, Lysimeters.
Identifiers: *Soil systems.

A study of the interaction of environmental factors with design factors such as dosing frequency, and waste pre-treatment is an essential prerequisite for the establishment of design principles for soil systems. A number of environmental factors were investigated for their effect on the treatment potential and hydraulics of soil systems. The parameters used for this investigation were chemical oxygen demand, MBAS, ammonia-nitrogen, and hydraulic longevity. The controlling factor for hydraulic longevity and treatment efficiency was the effect of depth in shallow systems, 2 to 4 feet. It is reported that this is probably due to the limited reaeration opportunity in the unsaturated zone. The effects of climate on removal efficiency are also studied. The tables are given presenting the effect of unsaturated depth on performance, interaction between climate and pre-treatment, interaction between climate and dosing frequency, and effect of vegetation on performance. In studying the climatological effects, the mean daily temperature in winter was 33 deg. F and in summer was 73 deg. F. Summer longevities were uniformly three times the winter longevities. It should be noted that the early days of operation are critical for the rate of biological development and extended longevities. The un started in summer ran through the following wint without any difficulty. (Hancuff-Texas)

TRAINING AND CERTIFICATION OF WAST WATER OPERATORS IN TEXAS,
Huppert (Jack) Co., Inc., San Antonio, Tex.
Jack E. Huppert.
Journal of the Water Pollution Control Federatio Vol. 42, No. 4, p 641-644, April 1970. 1 tab.

Descriptors: *Training, *Education, Sewage trea ment, Waste water treatment, Operations, Permit
Identifiers: *Certification, Responsibility, Licens Texas.

The history of the development of certification the State of Texas is presented. The program bega on a voluntary basis in 1939 and was so well a cepted that by 1945 certification became mandat ry without opposition. Almost 600 certificates we issued under the voluntary plan and were 'gran fathered' when the mandatory law was passe Cooperation between state agencies, operat groups, universities, and municipal officials h been the key to success of the program for trainin and certifying operators. An annual short school held each year on the campus of Texas A and M University. The school extends over a period of days with one half of the time devoted to wat works instruction and one half to waste water i struction. The Texas Water Utilities Associatio encompasses 40 district associations and has a tot membership of approximately 40,500. Monthl meetings are held and attended by operators withi the areas. Programs consist of round table discus sions, education films, or lectures from visiting c local speakers. In addition to the monthly meeting some district associations within the region joi together to sponsor a 3 day short school. The re gion schools are designed to provide for those wh can not attend the annual short school at Texas A and M. A list of the various qualifications for cer tification of grades A through D is tabulated. A on and two year water and waste water technolog course is conducted at James Connally Technica Institute in Waco. (Hancuff-Texas)

FILTRATION TECHNIQUES IN TERTIARY TREATMENT,
Stanford Univ., Calif.
George Tchobanoglous.
Journal of the Water Pollution Control Federation Vol 42, No 4, p 604-623, April 1970. 15 fig, 8 tab 18 ref.

Descriptors: *Filtration, *Tertiary treatment, *Per formance, *Headloss, Sewage treatment, Waste water treatment, Activated sludge, Pilot plant, Tur bidity, Mathematical model, Design, Operations research.
Identifiers: *Removal mechanisms, Polyelec trolytes, Suspended solids.

A thorough investigation of filtration techniques used for treating settled secondary effluent is described. The removal efficiency for filtration without the addition of chemicals is primarily a function of grain size. Typical removal efficiencies using conventional single medium sand or anthracite filter beds with depths of 18 to 30 inches varied depending upon the grain size from 10 to 60%. In the filtration of settled effluent with and without the addition of chemicals turbidity breakthroughs were not observed within the headloss range studied, 8 to 10 feet. As presently designed the sand layer in most duel medium filter beds is not utilized effectively. In multi-media filter bed if the anthracite layer is greater than 16 to 20 inches media placed below the anthracite contributes little to the overall suspended solids removal. Polyelectrolytes can be used as an additive to achieve varying degrees of suspended solids removal from secondary effluents using single, dual and multi-media filter beds. The distribution of

pended solids within the filter can be controlled varing the amount and point of addition of yelectrolytes. The grain sizes utilized in this dy varied from 0.49 mm to 0.98 mm and dings varied from 2.0 gal/min/sq ft. to 10.0 min/sq ft. For studying the suspended solids noval the polyelectrolyte dosage varied from 20 40 mg/l, while the electrophoritic mobility was asured varying polyelectrolyte dosage from 0 to mg/l. (Hancuff-Texas)

IGNOSULFONATES IN PETROLEUM FER- ENTATION,
ritish Columbia Univ., Vancouver.
. L. Liu, and P. M. Townsley.
Journal of the Water Pollution Control Federation, Vol 42, No 4, p 531-537, April 1970. 9 fig, 2 tab, 2 ref.

Descriptors: *Fermentation, *Growth rates, Respiration, Microorganisms, Bacteria, Pulp wastes, Surfactants.
Identifiers: *Petroleum, *Lignosulfonate, Culture media, Kerosene, Vancouver (British Columbia).

The addition of polymerized lignosulfonates into hydrocarbon fermentation media greatly increases the fermentation rate and the yield of biomass. Lignin itself does not appear to decompose during the fermentation; however, immediately upon the addition and vigorous mixing a stable oil water medium emulsion is formed. This emulsion increases the hydrocarbon water interfacial area, thus overcoming the major factor limiting microbial activity. The removal of hydrocarbon as a growth limiting factor in fermentation greatly reduces the requirement for oil dispersion equipment. The effects of the addition of a commercial grade lignin and a surface active agent on acid production, oxygen uptake rate and cell yield are determined on cultures isolated by the kerosene enrichment procedure. The oxygen uptake rate as a function of the carbon chain length in the basic medium was determined. C7 to C11 showed significant increase in dry cell weight in the presence of commerical lignin. A comparison of the dry cell yield and the acid production as a function of kerosene concentrations also is determined. This study indicates that lignosulfonates may be an inexpensive ingredient in water and pollution control fermentations. (Hancuff-Texas)

STOP-GO DIGESTERS AT READING,
R. L. Summers, J. F. Marshall, and S. D. Wood.
Water Pollution Control, Vol 69, No 2, p 149-158, March-April 1970. 7 fig, 5 tab, 4 ref.

Descriptors: *Anaerobic digestion, *Toxicity, *Ammonia, Performance, Laboratory tests, Detergents.
Identifiers: *Anionic detergent, *Loading rates, Failure, Concentrations, Reading (England).

The conventional control parameters of anaerobic digestion gave no advance warning of a series of failures which were described. An empirical anaerobic 'activity' test in which digester samples were slug fed and hourly gas production rates recorded was proposed as a means of indicating environmental change and consequently could give an early indication of impending failure. Laboratory studies were conducted to investigate the toxicity of ammonia nitrogen and anionic detergent concentration on anaerobic digestion. Results showed severe suppression at an ammonia nitrogen concentration of 1500 mg/l with the anionic detergent level held at 2% of dry solids, and an ammonia nitrogen concentration of 1050 mg/l and anionic detergent as 2.4% of the dry solids. A related study of high loading rates is presented. Results from laboratory digesters showed that the loading rate could be increased from 0.1 lb volatile matter/cu ft-day to 0.3 lb volatile matter/cu ft-day. (Galwardi-Texas)

WATER MANAGEMENT SAVES MONEY,
C. R. Kolzow.
Water and Sewage Works, Vol 116, No 5, May 1969. p 6-7, 3 tab.

Descriptors: *Metals, *Industrial wastes, *Industrial water, *Water reuse, *Water users, Chromium, Water pollution control.
Identifiers: *Metal finishing industry, Zinc cyanide.

Water use in the U.S. increased from 40 bgd in 1900 to 320 bgd in 1960 and is expected to increase to 600 bgd by 1980. By reuse and recirculation, the total water requirement of industry can be reduced. 80% of total water is used in irrigation and 94% of this volume is consumed by plant growth or evaporation. Industry consumes only 8% of the water it uses. In-plant control of industrial wastes should be investigated. Every industry can reduce their primary water needs by process improvement, water conservation, and water reuse. Where cooling is the principle use, substitution of recycle for once through can reduce water intake by as much as 90%. Savings of $40,000 per year in a metal finishing plant were recognized as a result of installation of counter-current rinsing, chrome recovery, plating salt recovery, demineralized water recovery, zinc cyanide recovery, and temperature regulation. SEWAGE WORKS MAINTENANCE,
W. E. Oliver, B. J. Vousden, and E. G. Eves.
Water Pollution Control, Vol 69, No 2, p 166-169, March-April 1970.

Descriptors: *Maintenance, *Facilities, *Sewage treatment, *Labor, Management, Waste water treatment.
Identifiers: *Preventive maintenance, *Comminutors.

The method of preventive maintenance which evolved at the sewage treatment plant at the London Borough of Sutton is described. The basic concepts presented can be used as a foundation for almost any sewage plant. Equipment breakdown, and subsequent shut-down of plant operation can be avoided by a proper program of well planned preventive maintenance. All operating machinery should be lubricated regularly and inspected for defects in equipment or operation. Defects should be registered by a Defect Report, and Maintenance Reports should also be required. Certain commonly used spare parts should be stockpiled. Standardization of equipment is recommended both from the viewpoint of interchangeability of parts and decreased requirements for stockpiled parts not neglecting the increased familiarity of maintenance personnel working on only one line of equipment. Painting increases the life of equipment. The use of three coats of different color helps in inspection to see the coats are properly applied. Buildings, roads, and grounds need less frequent maintenance. (Makela-Texas)

ENUMERATION STUDIES ON METHANOGENIC BACTERIA,
National Inst. for Water Research, Pretoria (South Africa).
M. L. Siebert, D. F. Toerien, and W. H. J. Hattingh.
Water Research, Vol 2, No 9, September 1968, p 545-554. 5 tab, 2 ref.

Descriptors: *Anaerobic bacteria, *Methane bacteria, *Statistical methods, Carbon dioxide, Hydrogen, Vitamins.
Identifiers: *Media, Mineral salts, Fatty acids, Digester fluids, Rumen fluids, Acetate, Formate, Glucose, Colony counts.

A statistical comparison of various media for the enumeration of methanogenic bacteria was performed. A digester receiving a synthetic substrate was used as a source of innocula during these studies. Two experiments were carried out. In the first experiment eight treatments with five replications of each treatment, and in the second experiment twenty-two treatments with five replicates of each treatment were compared. A reduced medium containing mineral salts, vitamins, small amounts of fatty acids, carbon dioxide (22%) and hydrogen (78%) should be used for the enumeration of methanogenic bacteria. The addition of rumen fluid and digester fluids to the media seemed to have stimulated the growth of more colonies, some of which may have been non-methanogenic in origin. Additions of formate, acetate and glucose resulted in repressed bacterial counts in certain circumstances. (Galwardi-Texas)

Identifiers: *Autoxidation, Refinery waste, Chemical oxidation, Aeration tower, Free radical.

Residual dissolved organic contaminants are harbingers of trouble in industrial water systems and must be reduced to a minimum before the waste water can be reused successfully. Methods of removal of these organic residuals generally fall into three classes: (1) Biological degradation, (2) Chemical oxidation, (3) Physical stripping. A chemical oxidation process which utilizes autoxidation reactions is described. The process takes advantage of stripping and cooling action as well as oxidation. A series of chain reactions in the autoxidation system are presented. The role in initiators in the formation of free radicals is discussed. Aeration techniques in design of an aeration tower are presented. The influence of biological activity on reduction of chemical oxygen demand was evaluated with the conclusion that chemical oxidation existed independently of biological oxidation. The results of this study indicated that the oxidation-aeration tower offers an economical method for removal of small organic residuals by autoxidation, and stripping of ammonia and other unwanted gases at about the same cost as that of cooling the water. The aeration tower used for these studies has a height of 25 feet, a width of 4 feet, and a depth of 6 feet. The volume of water charged to the tower which gave the best results was 25 gal/min/sq ft. and an air flow of 7600 cfm. Residence time for water flowing through the tower was estimated at 3 to 6 minutes. (Hancuff-Texas)

METAL-FINISHING WASTES CAN BECOME POTABLE WASTES,
Leeds and Northrup Co., North Wales, Pa.
F. C. Snowden.
Water and Sewage Wastes, Vol 116, No 5, p 9-11, May 1969. 4 fig, 2 tab.

Descriptors: *Industrial wastes, Copper, *Chromium, *Treatment facilities, Hydrogen ion concentration, Chemical reactions, Industrial waste, Waste water treatment, Oxidation, Reduction, Potential.
Identifiers: *Metal finishing, North Wales (Pa), *Cyanides, *Nickel.

A description of the waste treatment facility for Leeds and Northrup Company metal-finishing plant is presented. The major pollutants in the waste include cyanides, chromates, copper and nickel. At various times the effluent is either highly alkaline or acidic. The waste treatment facility is a Lancy Laboratories, Inc. design and is basically a series of processes, each designed to neutralize a particular contaminant. Each process is equipped with its own set of pH and/or ORP controls. A conductivity monitor checks steam condensate from the heating coils in the plating solutions. The treatment system provides for the removal of cyanide, nickel, chromium and copper in addition to neutralization of the waste. Equilibrium equations used in the design of each system were presented along with an average analysis of the waste stream after treatment. (Galwardi-Texas)

WATER REUSE IN INDUSTRY,
Engineering-Science, Inc./Texas, Austin.
E. F. Gloyna, D. L. Ford, and J. Eller.
Journal of the Water Pollution Control Federation, Vol 42, No 2, p 237-242, Feb 1970. 8 fig, 2 tab.

Descriptors: *Waste water treatment, *Oil industry, *Water reuse, *Industrial wastes, *Cooling towers, Cation exchange.
Identifiers: *Refineries, *Storm water runoff, *Collection system, Boiler blowdown.

A system designed to treat liquid wastes from oil refineries and produce a salable product is described. About 40 million gallons of spent phenolic caustic wastes and 20 million gallons of spent sulfide caustic wastes are shipped to the treatment plant. Known pollutants in the waste material include phenols, cresols, cresylic acid, mercaptans, sulfides, thiophenols, caustic soda, and heavy metals. The finished products are cresylic acid and sodium sulfide solutions. The waste water collection system consists of a comprehensive network of drip-pans, collection troughs, dikes, and tanks. This network is interconnected to the process system and cooling towers. The cooling towers are used to reduce the concentration of organics and to concentrate the undesirable precipitates. High concentrations of heavy metals are reported in the cooling tower sludge and total carbon in the settled sludge and filtrate, respectively, is about 200,000 mg/l and 50,000 mg/l. The first half inch of rainfall is diverted to tankage, the second half inch is sent to storage for ultimate use as cooling tower makeup water, and any uncontaminated excess storm water overflow is released to a nearby water course. Cation exchangers are used to treat blowdown from the boilers. (Galwardi-Texas)

DETECTION OF INDUSTRIAL WASTES IN MUNICIPAL SYSTEMS,
San Diego Water Quality Control Board, Calif.
Ladin H. Delaney.
Journal of the Water Pollution Control Federation, Vol 42, No 4, p 645-648, April 1970.

Descriptors: *Industrial waste, *Sewage treatment, *Sampling, Waste water treatment, Activated sludge, Digestion, Maintenance, Odor.
Identifiers: *Detection, *Surveilance, Collection systems.

Because of the wide range and infinite variety of industrial wastes it is almost physically impossible to install automatic sampling and analytical equipment that will do an adequate job of detecting all industrial wastes in a non-homogenous waste water flow such as municipal waste. It is necessary for operating and maintenance personnel to represent the first line of attack for industrial waste detection. A most important indication that an industrial waste is being discharged to the system is a change in color. Many industries impart a characteristic color to the waste water. Copper sulfate is blue, chromium is green, milk waste is white, slaughter house waste is red. Odors also can be an important indicator. Solvents and many other chemical have peculiar smells which will impart a different odor to the waste water. Temperature sometimes is an indication that thermal wastes are being discharged. Excessive amounts of water vapor rising from the influent stream should be investigated. Many times visual olfactory signs are not manifested and it becomes necessary to observe the side effects on the system itself. Corrosion is an excellent example. Other side effects are activated sludge and digester upsets. An example is cited in which an increase in sludge production was found to indicate a potential overload of the digester system. NTA REMOVAL BY ACTIVATED SLUDGE--FIELD STUDY,
Ohio State Univ., Columbus; and Proctor and Gamble Co., Cincinnati, Ohio.
K. S. Shumate, J. E. Thompson, J. D. Brookhart, and C. L. Dean.
Journal of the Water Pollution Control Federation, Vol 42, No 4, p 631-640, April 1970. 5 fig, 3 tab, 6 ref.

Descriptors: *Activated sludge, *Degradation (Decomposition), Removal, Operations, Waste water treatment, Sewage treatment, Detergents, Surfactants.
Identifiers: *Trisodium nitrilotriacetate.

A one MGD conventional activated sludge treatment plant was used for the study of trisodium nitrilotriacetate (NTA) degradation. The NTA was fed at a maximum expected level of 8 mg/l and was 90% removed by the activated sludge treatment. At a higher level, 16 mg/l, removal varied widely but averaged 75%. At no time did the addition of NTA have any effect on plant performance and degradation of NTA continued in the receiving stream and was probably essentially complete within two miles downstream. The data presented indicated that there is a very slight removal of NTA in the primary tanks amounting to an average of about 8% for the entire duration of the study. Variability of NTA removal increased with increasing NTA dosage resulting in a significant decrease in average removal. (Hancuff-Texas)

ALGAL PERIODICITY AND WASTE RECLAMATION IN A STABILIZATION POND ECOSYSTEM,
Iowa State Univ., Ames.
Ronald L. Raschke.
Journal of the Water Pollution Control Federation, Vol 42, No 4, p 518-530, April 1970. 2 fig, 6 tab, 40 ref.

Descriptors: *Waste water treatment, *Ponds, *Algae, Lagoons, Biochemical oxygen demand, Chemical oxygen demand, Phosphates, Nitrogen, Stabilization.
Identifiers: *Water reclamation, Variations, Composition.

In an attempt to evaluate possible procedures for meeting new standards of the Federal Water Quality Act, the Ames Water Pollution Control Department built a number of experimental ponds. One of them was made available for the present investigation in which the intent has been to study algal composition and periodicity, dissolved oxygen, pH, temperature, and the extent of reduction in 5-day BOD, COD, solids, phosphates, ammonia, and nitrates through the plant pond complex. The pond is 0.12 acres in area with a water holding capacity of 105, 562 gallons and an average depth of 2.53 feet. The pond detention time ranged between 3.7 to 4.2 days. Results showed that algal periodicity and BOD analysis may be influenced by algal inhibitors. Green fagellates dominated in winter and spring, while coccoid greens dominated in summer and fall. The maximum per cent removal at any one time was 78% and 75% for BOD and filtered BOD respectively. The maximum COD removal was 63%. Total suspended solids ranged from 458 to 687 which is less than a limit of 1000 mg/l set by the U.S. Public Health Service Standards. Ammonia nitrogen ranged from 0.0 to 21.0 mg/l and nitrate nitrogen ranged from 0.5 to 1.8 mg/l. pH ranged from 7.35 to 9.09 and temperature from 0.8 deg C to 29.9 deg C. The effluent usually met the Iowa Water Pollution Control Commission's standards for temperature, pH, dissolved oxygen concentration, but phosphorus and nitrogen contents were high. (Hancuff-Texas)

MICROBIOLOGY OF DOMESTIC WASTES, I. PHYSIOLOGICAL ACTIVITY OF BACTERIA INDIGENOUS TO LAGOON OPERATION AS A FUNCTION OF SEASONAL CHANGE,
Manitoba Univ., Winnipeg.
Harvest Halvorson, M. Ishaque, and H. Lees.
Canadian Journal of Microbiology, Vol 14, No 4, p 369-376, Apr 1968. 6 fig, 20 ref.

Descriptors: *Bacteria, *Domestic wastes, *Lagoons, Microbiology, Waste water treatment.
Identifiers: *Physiological activity.

ıe physiological activity of bacteria indigenous to midicontinental domestic waste disposal unit agoon) was studied over a period extending from id-May to the beginning of December 1965. A gorous climate induces a layer of ice over the goon for approximately 5 months of the year; this udy entailed the interval under ice-free condi-ons during the first year of operation. Samples ere collected roughly at weekly intervals and the tivity of the bacteria free of algae was studied ainst several arbitrarily selected organic sub-rates. The activity was found to be a function of) the number of bacteria, (b) the temperature of e lagoon, and (c) the nature of the best substrate. ıe most rapid rates of oxidation occurred with samino acids, acetate, and palmitate. Glucose, g albumin, and liqui-nox, a biodegradable deter-nt were oxidized in a variable manner. Maximum tivity occurred at 23 deg C, the highest tempera-re reached by the lagoon during the summer. The tes of oxidation decreased as a result of the onset fall but all activities were not affected equally by e same temperature change. (Aguirre-Texas)

IICROBIOLOGY OF DOMESTIC WASTES. II. COMPARATIVE STUDY OF THE SEASONAL HYSIOLOGICAL ACTIVITY OF BACTERIA NDIGENOUS TO A SEWAGE LAGOON,
Ianitoba Univ., Winnipeg.
arvest Halvorson, M. Ishaque, and H. Lees.
anadian Journal of Microbiology, Vol 15, No 6, p 63-569, June 1969. 2 fig, 35 ref.

escriptors: *Metabolism, *Sewage lagoons, Temperature, Bacteria, Domestic wastes, licrobiology, Waste water treatment.
lentifiers: *Physiological activity.

comparative study was made of the physiological ctivity of bacteria seasonally present in a sewage agoon which experiences warm summers and very old winters. Bacteria recovered from surface sam-les of lagoon water during summer were able to etabolize glucose, acetate, palmitate, creatinine, itamin-free casamino acids, egg albumin, and urea erobically at 25 deg C, the highest prevailing tem-erature during the summer. Under anaerobic con-itions, acetate and palmitate were the only sub-trates not metabolized. Bacteria recovered from amples of lagoon water taken during winter were ble to metabolize aerobically glucose, acetate, almitate, creatinine, and urea at 2 deg C, the revailing temperature under ice cover, but asamino acids and egg albumin were not etabolized aerobically at 2 deg C or 25 deg C. cetate, palmitate, casamino acids, and egg albu-in were not metabolized anaerobically by bac-eria in winter samples. Urea was hydrolyzed much nore rapidly by bacteria in the winter samples and probably the preferred nitrogen source for rowth under winter conditions. The optimum pH or oxidation of acetate and casamino acids by bac-eria in summer samples was 7.0; only 50% of the naximum activity was obtained at pH 9.0, virtually he highest pH that was found under natural condi-ions. Bacteria active at low temperatures con-ribute appreciably to the stabilization of domestic vastes by the lagooning method even under severe vinter conditions. (Aguirre-Texas)

A CHARACTERIZATION OF TUNA PACKING WASTE,
Hawaii Univ., Honolulu.
Michael J. Chun, Reginald H. F. Young, and Nathan C. Burbank, Jr.
Proceedings of the Industrial Waste Conference, 23rd, p 786-805, May 1968. 10 fig, 6 tab, 10 ref.

Descriptors: *Biodegradation, *Biochemical oxygen demand, *Biological treatment, *Fish, *Wastes, Nutrients, Toxicity.
Identifiers: *Characterization, *Treatability, *Tuna packing wastes.

The characterization of a tuna cannery waste revealed a pH, temperature and dissolved oxygen content suitable for biological treatment. The total solids content of the tuna packing waste was 17,900 mg/l of which 37% was organic matter. Biodegradation of the tuna waste was limited as indicated by a COD/BOD ratio of 0.4. Treatability studies conducted on the waste gave an average daily COD range from 1300 to 3250 mg/l and an average daily BOD5 range from 500 to 1550 mg/l. Excess nutrient material was present in the form of phosphorus and nitrogen with a BOD5/N/P ratio of 100/68/7. The tuna waste alone was not conducive to aerobic biological treatment due to some inhibitory or toxic reaction. Dilution with domestic sewage in a ratio of 4/1 resulted in a material that was treated to about 60% of the theoretical oxygen demand. Long-term BOD studies indicated that the nitrogenous oxygen demand was about 40% of the total demand. (Aguirre-Texas)

POLLUTION ABATEMENT TECHNOLOGY DEGREE OFFERED.
Charles County Community Coll., La Plata, Md. Dept. of Biology.

Water and Sewage Works, Vol 116, No 1, p 20-22, January 1969.

Descriptors: *Education, *Training, *Waste treatment, *Waste water treatment, Treatment facilities, Operation and maintenance.
Identifiers: Treatment plant operators.

In 1966, Charles County Community College began a project, the primary goal being the training of technical manpower in the fields of water pollution and waste management. An Associate of Arts degree will be awarded to graduates of the two-year, one summer curriculum which covers the background, theory, and technical training in each subject area. Facilities include a new building with classrooms and laboratories, and a functional waste treatment plant serving both the college and the community. Career opportunities are expected to be unlimited and may include such positions as treatment plant supervisor, field technician, laboratory technicial, and industrial waste technician. A listing of the proposed curriculum is included. (Makela-Texas)

FISH OIL AND PROTEIN RECOVERED FROM FISH PROCESSING EFFLUENT,
Kurita Water Industries Ltd., Yokahama (Japan); and Hayashikane Sangyo Co., Ltd., Shimonoeski (Japan).
Kenji Kato, and Shizuhiro Ishikawa.
Water and Sewage Works, Vol 116, No 10, p 412-416, October 1969. 5 fig, 6 tab, 1 ref.

Descriptors: *Industrial wastes, *Waste water treatment, *Fish, *Proteins, Fish handling facilities.
Identifiers: *Fish oil, *Product recovery.

Fish oil and protein are recovered as a valuable byproduct in the treatment of an effluent from a fish processing plant in Shimonoseki, Japan. Fish meat from horse mackerel, scabbard fish, and yellow croaker is first machined to remove head and guts, and then is separated from the bones to make a chop, with a yield of 60-65% by weight. Water is added to form a slurry. The slurry is put through a gravity settling unit and oil is removed by skimming. Meat solids are centrifuged to form a primary product. The effluent produced then passes into another unit where oil is removed by gravitational flotation. The oil is heated to 90 deg C to coagulate protein mixed in with the oil and the mixture is centrifuged to remove the protein. The underflow from the oil separator is sent to coagulation tanks where HCl is added to lower the pH from 6.0-7.0 to 5.0-5.5, and a coagulant aid is added. The coagulated protein is then subjected to pressurized floation for 30 minutes. The protein is removed by skimmers and is vacuum filtered. Recovered protein brings 0.6 cents/lb based on 82% moisture content. Recovered oil brings 3.5 cents/lb. A total of 25 tons of protein and 1.6 tons of oil are recovered daily from 1,170 tons of raw effluent. Suspended solids were reduced 86%, and BOD was reduced 77%. (Makela-Texas)

NEW FLOTATION AIR FOR PAPER MILL WHITE WATER SYSTEM,
Proctor and Gamble Co., Cincinnati, Ohio.
D. J. Hahn, J. J. Jende, T. F. Rich, and F. J. Tremel.
Water and Sewage Works, Vol 116, No 8, p 321-324, August 1969. 5 fig, 1 tab, 2 ref.

Descriptors: *Industrial wastes, *Flotation, Waste water treatment, Laboratory tests, Pilot plants, Performance, *Pulp wastes, Pulp and paper industry.
Identifiers: *Suspended solids, *Coagulant, *Cationic, *Guar gum, Full-scale unit, Concentration.

The establishment of new and more stringent suspended solids discharge allowances, required the improvement of the white water flotation process. Approximately fifty different chemicals were evaluated by the Charmen Paper Products Company for flotation improvement. Based upon the laboratory results, six chemicals were selected for further study in a pilot flotation unit. A modified cationic guar gum coagulant yielded the best results. The effluent suspended solids concentration dropped to less than 10 mg/l and the solids being scraped off the unit became noticeably more compact and thicker. Tests on full-scale units showed that the effluent suspended solids dropped from over 120 mg/l to less than 36 mg/l with an addition of about 2 mg/l of the chemical. (Galwardi-Texas)
W70-07954

WATER CONSERVATION REDUCES LOAD ON SOHIO'S WASTE TREATMENT PLANT,
Sohio Refinery, Lima, Ohio.
B. A. Rose.
Water and Sewage Works, Vol 116, No 9, p 4-8, September 1969. 3 fig.

Descriptors: *Industrial wastes, *Industrial water, *Oil, *Waste water treatment, *Water reuse, *Waste water disposal, *Oily water, Oil industry.
Identifiers: Oil-water separator.

The Sohio refinery at Lima, Ohio, on the Ottawa River currently processes 55,000 barrels of crude oil per day. This refinery burns about one billion BTU/hr in its furnaces, and requires 40,000 gpm of water for cooling purposes, if the water is used once, and picks up 30 deg F. Groundwater makes up the source of supply. Cooling towers permit recirculation of 40,000 gpm of water for cooling and condensing operations. Make up waters include 3000 gpm of well water to replace water lost by evaporation, physical loss, and the 1800 gpm of cooling tower blowdown. Smaller quantities of process waste waters also contribute to the plants waste stream. Recirculation of cooling waters conserves water, reduces the volume of waste water to be treated, and minimizes loss of pollutants. Sodium hydroxide solutions used in several treatment operations are regenerated for reuse or sold. Separate sewer systems allow recovery and reuse of lost chemicals. Water used in the high pressure hydraulic coke cutter is recycled to prevent contamination of oily waters with fines which might stabilize oil-water emulsions. Sulfides are removed in steam strippers, and phenolic waters are used as makeup in the crude oil desalting process. In spite of all closed sewer systems and conservation procedures, 2500 gpm of waste water are produced and need to be treated. Primary treatment occurs in an API oil-water separator, which recovers more than 300 barrels of oil per day. (Makela-Texas)

POULTRY PROCESSOR MEETS CHALLENGE OF INCREASED WASTE LOAD,
Gold Kist Poultry, Atlanta, Ga.
William J. Camp.
Water and Sewage Works, Vol 116, No 9, p 24-26, September 1969.

Descriptors: *Design criteria, *Industrial wastes, *Poultry, Waste water treatment, Biochemical oxygen demand (BOD), Performance, Farm wastes, Florida.
Identifiers: *Extended aeration, *Suspended solids, Live Oak (Fla).

Design criteria and operating results of an extended aeration treatment system for a complete poultry processing plant are presented. The processing plant is designed to handle 50,000 birds per day utilizing 10 gal of water per bird and have an organic load of 52 lb BOD per 1000 birds. The treatment system consists of a by-products collector tank, 80-minute detention time; two extended aeration tanks, 24-hour detention time; final settling tank, 2-hour detention time; aerobic digester; polishing pond; chlorination system; and two sludge drying beds. Operating results obtained indicate a water usage of about 7.6 gal per bird, with a BOD loading of about 39 lb per 1000 birds. Effluent from the final clarifer shows a 99% BOD removal with an average of 8 mg/l BOD and 98% suspended solids removal with an average of 10 mg/l. The effluent from the polishing pond averages 3 mg/l BOD with a dissolved oxygen average of about 8.0 mg/l. (Galwardi-Texas)

EFFECTS OF NITROGEN LIMITATION ON THE GROWTH AND COMPOSITION OF UNICELLULAR ALGAE IN CONTINUOUS CULTURE,
School of Aerospace Medicine, Brooks AFB, Tex.
B. Richardson, D. M. Orcutt, H. A. Schwertner, Cara L. Martinez, and Hazel E. Wickline.
Applied Microbiology, Vol 18, No 2, p 245-250, August 1969, 3 fig, 4 tab, 19 ref.

Descriptors: *Growth, *Algae, Lipids, Nutrients, Chlorella, Cultures.
Identifiers: *Fat accumulation, *Laboratory studies, *Nitrogen limitation, Batch cultures, Chlorella sorokiniana, Composition of algae, Continuous cultures, Fatty acids, Oocystis polymorpha, Unicellular algae.

Fat accumulation takes place in many algae as a response to exhaustion of the nitrogen supply and may provide a means of enchancing the potential food value of algae. Chemostatic continuous cultures of Chlorella sorokiniana and Oocystis polymorpha were subjected to successive reductions in influent nitrogen. As cellular nitrogen content decreased from about 10 to 4%, oxygen evolution, carbon dioxide uptake, chlorophyll content, and tissue production were drastically reduced, but total lipid content was essentially unchanged. In batch-cultured cells, nitrogen could be reduced to 3% of dry weight, causing an increase in total fatty acids and pronounced changes in the composition of the fatty acid fraction. These results suggest that cellular nitrogen must fall to about 3% of dry weight before appreciable increases in lipid synthesis can occur. All nitrogen is then apparently completely bound in essential cell constituents, and carbon subsequently fixed is converted into lipid products. Nitrogen limitation may be useful in increasing the food quality of batch-cultured cells, but the technique has little value for continuous culture systems per se. (Aguirre-Texas)

WATER AND EFFLUENTS,
Society of Dyers and Colourists, London (England).
R. W. Moncrieff.
Textile Manufacturer, Vol 93, p 11-13, 1967.

Descriptors: *Effluents, *Surfactants, Waste water treatments.
Identifiers: *Effluent treatment, *Water consumption, Dyehouse wastes, Rinsing wastes, Textile mill wastes.

At a symposium sponsored by the Society of Dyers and Colourists (London), two papers dealt with textile wastes and treatment thereof: Surface Active Agents in Processes and Effluents, by W. V. Barnes and S. Dobson, and Treatment of Effluents, by A. H. Little. (1) On today's market, 300-400 commercial surfactants are available in the United Kingdom and 2,000 - 3,000 in the United States. Along with giving the main classes of Textile Surfactants, the authors listed ten considerations which would lead to a suitable choice: (a) Nature of fiber, type of sail, and kind of machine used, (b) Foaming present or not, (c) Hardness of water, (d) Stability in presence of acids alkalis and metal salts, (e) Compatability with dyestuff and finish, (f) Absorption characteristics, (g) Cost, (h) Physical form, (i) Activity at low concentration, and (j) Influence on effluents. (2) The treatment of effluents is inevitable in today's textile industry. The surfactant used has much to do with the treatment afforded. This treatment determines the waste's acceptability by sewage works and must be dealt with early. The author in answering a question about rubber latex in the effluent gave a use for the waste. He commented his company had allowed the latex to collect on pebbles used as a filter. When these pebbles were completely coated they were used for a new covering of the parking lot. RECENT PROGRESS IN TREATMENT OF TEXTILE WASTE WATERS,
Peter W. Sherwood.
Canadian Textile Journal, Vol 82, p 40-43, September 3, 1965. 1 fig, 1 tab.

Descriptors: *Textiles, *Waste water treatment, *Oil wastes, Acidity, Alkalinity, Salts, Organic acids, Phenols, Soaps, Suspended load, Turbidity, Sulphur compounds, Nitrogen compounds, Odor, Taste, Oxygen requirements, Flow separation, Turbulance, Centrifugal pumps, Condensors, Filtration, Hydrogen ion concentration, Toxicity, Hardness, Separation techniques, Phosphorous compounds, Chlorine.
Identifiers: *Oil-in-water emulsions, Biological growths, Gravity separators, Demulsification, Aluminum compounds, Hydrogen-fluorene compounds, Sodium hypochlorite.

A classification of aqueous contaminants arising from textile operations breaks down into these categories: oil, both free and emulsified; acid or alkaline solutions; inorganic salts; organic acids and phenols or soaps of these compounds; suspended solids that increase turbidity; and various phenolic, napthenic, and organic sulphur and nitrogen compounds, toxic to marine life and causing unpleasant odors and tastes in water. Many of these organic compounds have a high oxygen demand. Biological growths occur in some of these wastes. For decontamination of oil-containing separable waters, gravity separators are used, but oil-water emulsions require chemical or electrical demulsifications processes. Three flow systems, recirculation, split flow, and pressurized flow, were studied. Recirculation was not used, but the method adopted proved highly effective, especially when activated silica and alum were added. Heat, chemical, and electrical costs used to treat oil-water emulsions may be reduced by jointly treating the emulsions and chemical wastes. Turbulent flow, centrifugal pumps, barometric condensers, and steam syphons should be avoided whenever possible because they favor formation of emulsions. Filtration can break up some emulsions by removing the stabilizing solids. Chemical factors which must be considered in textile wastes are pH, taste and odor, oxygen demand, toxicity, hardness, and suspended solids. Particularly troublesome regarding taste and odor are phenolic compounds and nitrogen bases, but extractive methods can reduce their nuisance. Aluminum chloride and phosphoric acids should be neutralized and HF-containing tars and aqueous liquers must be given special attention. Liquid chlorine or sodium hypochlorite centrol bacteria growths. (Lonon-North Carolina State)

NEW PROCESS FOR THE TREATMENT OF EFFLUENTS IN THE TEXTILE INDUSTRY (IN GERMAN),
Heinrich Riemer.
Zietschrift fur die Gesamte Textil Industrie, Vol 64, No 4, p 299-304, 1962. 3 fig, 4 tab.

Descriptors: *Flocculation, *Aeration, *Effluents, Storage tanks, Surfactants, Organic compounds, Adsorption, Resins, Costs, Chemical precipitation, Treatment facilities, *Waste water treatment.
Identifiers: Impurities, Dyes, Surface skin, Residues, Plant layout.

A new process which dispenses with the need for a large storage vessel and is thus particularly recommended for industrial concerns in highly built-up areas consists in the addition of a flocculating agent to and intense aeration of the effluent with simultaneous pH adjustment. This precipitates solid and colloidal impurities as a surface skin which can be easily removed, while residues of dyes, surface-active agents, and organic compounds are removed by adsorption into artificial resins. Typical layouts for the treatment plant are shown and costs are discussed. (Livengood-North Carolina State)

DOW SURFPAC PILOT STUDY ON TEXTILE WASTE,
Crompton-Shenandoah Co., Inc., Waynesboro, Va.
Duane W. Snyder.
Purdue University Engineering Extension Department, Extension Series No 115, p 476-482, 1963. 5 fig, 2 tab, 2 ref.

Descriptors: *Biological treatment, *Biological oxygen demand, *Trickling filters, *Waste water treatment, Waste water (Pollution), Pilot plants, Lagoon.
Identifiers: *Textile mill wastes, Shenandoah River.

At the Waynesboro, Virginia, plant of Crompton-Shenandoah Co., Inc., manufacturing corduroys, velvets, and velveteens, measures have been taken to modify plant processes to reduce the strength of the waste waters, which are discharged to South river, a tributary of the Shenandoah River. In view of the need to reduce the BOD of the effluent still further, various treatment processes were investigated, and pilot-plant studies were made on biological filtration, using synthetic Surfpac medium; results are tabulated, showing that the process was stable to shock loadings and the BOD was reduced by at least 50 per cent. The data obtained have been used to design a full-scale treatment plant which will also have an equalization pond, to permit operation over a 7-day period, and a final sedimentation tank; this should increase the reduction in BOD to 60-70 per cent. (Livengood and Work-North Carolina State)

INDUSTRIAL WASTES FROM SCOURING RUG WOOLS AND THE REMOVAL OF DIELDRIN,
Wiedeman and Singleton, Atlanta, Ga.
Robert D. Wilroy.
Proceedings of the Industrial Waste Conference, 18th, 1964, p 413-417.

Descriptors: *Dieldrin, *Waste water treatment, Streams, Suspended load, Screens, Sedimentation, Waste storage, Rivers, Septic tanks, Sewage, Fish, Dewatering, Sludge, Inorganic compounds, Effluents, Biochemical oxygen demand, Waste treatment, Lagoons, Solid wastes, Insecticides, Aquatic environment, Sedimentation.
Identifiers: Wool, Grit, Grease, Insect resistance treatments, Dyeing, Dyes, Decomposition, Equalization, Sand beds, Carpet mill wastes, Dyestuffs, Dyehouse wastes, Wool scouring.

hen it was planned to construct a rug manufacring plant in southeast USA, detailed studies ere made on the composition of the waste waters, e condition of the receiving stream, and the best pe of treatment. The coarse heavy wool used in eaving rugs has a high concentration of grit and organic suspended solids and a low initial grease ontent. It was learned that the waste waters would so contain large amounts of dieldrin, used for oth-proofing the wool, and there would also be aste waters from the dyeing process. The treatent facilities constructed consisted of fine reens, a sedimentation tank, and a baffled ualization lagoon to provide a long detention eriod with automatic discharge of the effluent at a te proportional to the flow in the river. Waste aters from the dyeing process are discharged to a nall creek flowing into the river, except when the yeing processes are deep red and black dyes are to e dumped, when the waste water is deverted to the goon. Effluent from the septic tank treating sanary sewage is also discharged to the lagoon. lthough the lagoon was designed only for ualization, there is evidence that active anaeroic decomposition is occurring, with reductions in OD of 80-90 percent. The concentration of dielrin in the final effluent is about 0.25 mg./l, and hen diluted with river water this should be educed to 0.0005 mg./l, which is much less than ne mean tolerance limit for the fish in the river. ome difficulty was experienced in dewatering the ludge on the sand beds, since the very fine wool nd grease form an impervious layer on top of the and and excess water collects on top of this. At resent, the excess water is removed by pumping nd the sludge dries rapidly. A dewatering system is o be installed. (Livengood-North Carolina State)

IMPLE BIO-AERATION KILLS STRONG WASTES CHEAPLY,
Frances Ridgway.
Chemical Engineering, Vol 70, No 1, p 40-41, 963.

Descriptors: *Biochemical oxygen demand, *Microorganisms, *Costs, Textiles, Sewage, Setling basins, Starch, Desizing wastes, Waste water reatment.
dentifiers: Aeration, Non-toxic wastes, Baffles, *Textile mill wastes.

A new bio-aeration system, based on action of microorganisms in a one-stage, prolonged process, s helping textile mills remove up to 90 percent of biochemical oxygen demand from strong starch desizing wastes. Developed by R. H. Souther, Greensboro, North Carolina, the process has four major advantages: (1) lower operational cost, (2) elimination of primary settling tanks and anaerobic sludge digesters, (3) decreases in the adverse effect from variable flow, changes in pH, and shock organic loadings in treatment of sewage and nontoxic organic wastes, and (4) increased flexibility in the use of air to obtain desired effluent characteristics. Waste water passes through a bar screen and a measuring device into an aeration tank, then through baffles to a final settling tank, and finally over weirs to the receiving stream. Sludge is returned to the influent end of the aeration tank to obtain highest BOD efficiency. Operating costs average 0.6 cents per pound of BOD influent per day, about 33 percent less than the cost for a conventional treatment plant. (Dandridge-North Carolina State)

ECONOMICAL UTILIZATION OF CAUSTIC SODA IN COTTON BLEACHERIES,
Allied Chemical Corp., New York. Textile Section.
W. R. Steele.
American Dyestuff Reporter, Vol 51, No 1, p 29-30, 1962.

Descriptors: *Costs, Air pollution, *Filtration, Cotton, Dialysis, Waste water treatment.
Identifiers: *Caustic soda, Sodium hydroxide, *Bleaching wastes.

Procedures have been developed for increasing the quantity and concentration of recovered caustic soda liquor to permit reuse of the maximum amount of caustic soda without reconditioning. If the concentration of caustic used liquor is not too low, it can be evaporated, purified, and reused. Because impurities must be concentrated before evaporation, filtration is required. Sometimes, dialysis is necessary to reduce soluble impurity content. A caustic reutilization survey may show that, although collection, filtration, evaporation, dialyzation, and re-evaporation may be needed, annual cost savings may exceed 50 percent. Beneficial side effects such as increased yardage return and alleviation of water and air pollution may also be obtained. (Dandridge-North Carolina State)

TREATMENT OF TEXTILE WASTES IN AERATED LAGOONS,
O'Brien and Gere, Syracuse, N.Y.
Samuel W. Williams, Jr., and George A. Hutto, Jr.
Proceedings of the Industrial Waste Conference, 16th, 1962, p 518-529. 7 fig, 2 tab.

Descriptors: *Waste storage, *Aeration, *Pilot plants, Chemical precipitation, Filtration, Sedimentation, Coagulation, Biological treatment, Biochemical oxygen demand, Cotton, Sludge, Sewers, Foaming, Sprays, Waste water treatment.
Identifiers: *Textile mill wastes, *Dyehouse wastes, Man-made fibers, Anti-foaming agents. Dyeing, Finishing, Caustic recovery, Starch.

The authors describe pilot-plant studies on treatment of waste waters from two textile mills of Burlington Industries, Inc. The plant at Mooresville, North Carolina, is an integrated cotton textile mill; various process modifications were made to reduce the volume strength of the waste waters, including installation of a caustic recovery unit and use of CMC instead of starch. Pilot-plant studies on treatment of the waste waters by chemical coagulation, biological filtration, and lagooning showed that good results could be obtained in aerated lagoons, and full-scale plant is being constructed; it will consist of two aerated lagoons with detention periods of 48 hours, and two sedimentation lagoons with detention periods of 12 hours with provision for recirculation of effluent if required. Sludge from the lagoons will be discharged to the municipal sewers. Foaming in the aerated lagoons will be controlled by addition of antifoaming agents, but sprays can be installed later if required. The mill at Wake Forest, North Carolina, receives fabrics from other mills for dyeing and finishing. In view of the successful results obtained with the aerated lagoons at the Mooresville plants, similar pilot-plant lagoons have been constructed at Wake Forest and are giving good results, with reductions in BOD of 75-80 percent. PRECIPITATION OF DIRECT DYES AND ACID DYES BY IRON SALTS (IN JAPANESE),
H. Iida, and M. Endo.
English summary included. Kogyo Kwagaku Zasshi, Vol 70, p 403-404, 1967. 4 ref.

Descriptors: *Chemical precipitation, Sodium sulfate, Waste water treatment.
Identifiers: *Direct dyes, *Acid dyes, *Iron salts, Clarification, Dyehouse wastes, Ferric chloride, Ferrous sulfate, Dyestuffs.

In order to obtain basic data for the clarification of industrial waste water containing dye, 18 direct dyes and six acid dyes were precipitated from each aqueous solution by the addition of ferric chloride or ferrous sulfate, and the amounts of precipitated dyes was determined. From the results it was found that ferric chloride and ferrous sulfate were excellent for the precipitation of direct dye, but were not useful for acid dye. It was difficult to precipitate acid dyes from their aqueous solution containing sodium sulfate by the above method. (Livengood-North Carolina State)

THE EFFECT OF SURFACE-ACTIVE AGENTS ON THE BIOCHEMICAL PURIFICATION OF EFFLUENTS FROM TEXTILE MILLS (IN RUSSIAN),
S. V. Yakovler, Y. M. Laskov, and Yu-Lin Yo.
Vodosnabzhenie i Sanitarnaya Tekhnika, Vol 9, p 12-14, 1963.

Descriptors: *Effluents, Aerokic treatment, Cotton, BOD, Sewage treatment, Sulfite liquirs, *Water purification, Waste water treatment.
Identifiers: *Biochemical purification, Printing, Sulfite liquirs, Cotton mill wastes, *Textile printing plant wastes.

As a result of widespread use of surface-active agents in the textile industry, the effluents from textile mills contain 50-125 mg/l of such agents, and higher concentrations can be expected in the future. The effect of these on the biochemical purification of effluents was studied in laboratory models of aeration tanks. The experiments were conducted on effluents from a textile printing plant to which various amounts of the most widely used surfactants were added, and on effluents from a cotton mill, containing surfactants in a total concentration of 60-130 mg/l. As determined by the reduction of BOD and organic chemicals demand, the addition of 20 mg/l of sulfanoles had no significant effect on the biochemical purification process. Higher concentrations substantually reduced and purification efficiency. In experiments with the cotton-mill effluents, satisfactory purification was obtained when the effluents were diluted with 40-100 percent domestic sewage, the needed amount of the diluent being determined by the nature and concentration of I, their maximum permissible concentration for effective purification ranged from 35 to 70 mg/l. THE SEWAGE TREATMENT PLANT AT NORDHORN (IN GERMAN),
D. Kehr, and P. Pflanz.
Gas- und Wasserfach, Vol. 7, p260-266, 1966.

Descriptors: *Activated sludge, *Sludge digestion, Pilot plants, Anaerobic digestion, Aerobic digestion, Biochemical oxygen demand, Solid wastes, Turbidity, Waste water treatment.
Identifiers: Permangenate demand, *Textile mill wastes.

An illustrated account of the design and operation of the activated-sludge plant at Nordhorn, Germany, designed for treatment of both sewage and textile industry waste waters. Extensive pilot-plant experiments carried out to prevent putrescible matter from inhibiting sludge digestion led to replacement of the anaerobic sludge digestion unit by a specially developed aerobic sludge-stabilization plant which is ordorless, less costly, and has proved most successful. Results showed removal of 70 percent of the permanganate demand and 93.5 percent of the 5-day BOD, leaving the effluent free from solids and reduced in turbidity. (C. Livengood - Robinson, North Carolina State)

AERATION, SETTLING, AND CHLORINATION OF THE COMBINED WASTE FROM A VISCOSE FIBER PLANT (IN RUSSIAN),
O. P. Sinev.
Trudy Novocherkasskogo Politeknicheskogo Instituta, Vol. 162, p33-43, 1966.

Descriptors: *Cellulose, *Textiles, Sludge disposal, Chlorination, Filtration, Flocculation, Aeration, Waste water treatment.
Identifiers: Hydrocellulose, *Rayon plant wastes, Zinc compounds, *Carbon disulfide.

Aeration of waste waters at a rate of 10-10.4 cu m/cu m waste water reduced the CS2 concentration from 41.6-82.3 to 5.2-9.0 mg/l., and H2S from 13.7-26 to 1.45-3.1 mg/l. Combined precipitation of suspended solids at pH > or = 10 gave intensive flocculation and precipitation of hydrocellulose and better conditions for extension of Zn (OH)2. Chlorination was most effective for a supplementary clarification after lime treatment and removal of suspended solids. The CL absorbability of the waste water after lime treatment, settling, and filtering through a sand filter was 46-73 mg/l. Residual CS2 and H2S concentrations in the waste waters at Cl2 doses equal to Cl absorbability were 5.3-12.9 and 0-7.1 mg/l., respectively. A preliminary aeration of the waste waters at pH < 3 considerably reduced Cl absorbability. Chlorination of aerated waste waters ensured complete oxidation of H2S and a decrease in CS2 concentration to 0.94-2.5 mg/l. and BOD to 32-60 mg/l. (Rhine-North Carolina State)

STUDIES ON THE TREATMENT OF WASTE WATERS FROM THE TEXTILE INDUSTRY (IN RUMANIAN),
E. Mambet, E. Cute, and L. Weiner.
Summaries in Russian, French and English. Studii de Protectia si Epurarea Apelor, Vol. 4, p307-332, 1962.

Descriptors: Cotton, Biochemical oxygen demand, Calcium chloride, *Waste water treatment.
Identifiers: *Dyehouse wastes, *Textile mill wastes, Wool scouring, Man-made fibers, Wool, Fabrics, Dyestuffs, Color.

Tests were conducted on the textile mill wastes which are most difficult to treat: those from the scouring of wool, spinning of natural silk, and finishing of fabrics containing cotton, wool, and man-made fibers. Data on the physico-chemical characteristics of the waste waters are reported in tables and graphs, and pilot-plant studies are described on possible methods of treatment of waste waters from the finishing of wool and man-made fibers. The wool finishing waste waters were generally alkaline, with a five-day BOD of 390-317.0 mg/l. and a highly variable color which disappeared at dilution between 1/5 and 1/500. With the finishing waste waters from man-made fibers, the color disappeared at dilutions between 1/7 and 1/10, the pH value was 6.5-9.0, and the five-day BOD was 85.0-130.0 mg/l. The best color removal, with simultaneous improvement of pH value, was obtained by treating the wool finishing waste waters with calcium chloride and aluminum sulfate in doses of 1.0-2.0 kg and .2 kg/cu m, respectively. These treatments also reduced the quantity of sludge produced by chemical treatment of the waste waters. After this treatment for color removal, waste waters resemble domestic sewage and can be treated biologically. (Work-North Carolina State)

INDUSTRIAL WASTES AND SALVAGE: CONSERVATION AND UTILIZATION,
C. H. Lipsett.
Atlas Publishing Company, New York, 1963, 2d Ed., 406 p.

Descriptors: *Dialysis, Sodium sulfate, Evaporation, Crystallization, Filtration, *Waste treatment.
Identifiers: *Caustic soda, *Rayon, *Dialysis, *Carbon disulfide, Viscose rayon, Man-made fiber plant wastes, Sodium hydroxide.

Except for Chapter 45 (p.258) the textile wastes referred to in this book consists of rags, threads, yarns and the like which are commercially salvageable. Caustic soda (sodium hydroxide) from the viscose rayon precipitating bath is recovered by dialysis, sodium sulfate is removed by vacuum evaporation followed by cooling, crystallization and filtration. Carbon disulfide in wash water is removed by vaporization before the waste water is discharged to the sewer. (Work-North Carolina State)

THE PURIFICATION OF WASTE WATER IN THE PRODUCTION OF POLYAMIDE-FIBER (IN GERMAN),
J. Kaeding.
Fortschritte der Wasserchemie und Ihrer Grenzgebiette, Vol. 5, p258-283, 1967. 13 ref.

Descriptors: *Biological treatment, *Chemical precipitation, Activated sludge, *Waste water treatment.
Identifiers: *Polyamides, Nylon-6, Man-Made fiber plant, Caprolactam.

Water from the production of nylon-6 was contaminated with organic substances, such as caprolactam oligomers, other by-products and detergents. Waste water purification by the activated sludge process was studied. Laboratory scale tests were carried out on a two-stage biological treatment followed by flocculation. The purification depended on the concentration of the influx and on the load. The conversion rate increased with the influx concentration. Holding time of 6 to 8 hours sufficed for the decomposition, with 30 deg C being better than at 20 deg C. The water containing only lactam was more readily purified than the waste water from the polymerization and the polyamide fiber production. The lactam was consumed by the micro organisms, so that only phosphates had to be added for microbial decomposition. Substances not easily biodegradable were removed from the waste water by absorption with coagulants such as aluminum sulfate, ferric chloride, ferrous sulfate and calcium hydroxide and the decomposition capacity was then approximately that of lactam-containing water. EXPERIENCE IN DECONTAMINATION OF EFFLUENTS FROM THE RODNIKOVSKY SPINNING MILL (IN RUSSIAN),
L. V. Krasovskii.
Gigiena i Sanitariya, Vol. 32, No. 7, p98-99, 1967.

Descriptors: *Coliforms, *Irradiation, Color, pH, Biochemical oxygen demand, *Chlorination, Chlorine, Waste water treatment.
Identifiers: *Textile mill wastes.

A table is given showing the change in color, pH, suspended solids and B.O.D. produced by a purification plant involving sand traps, settling basins, and aero-tanks. The coliforms required chlorination and a graph of residual chlorine vs. dosage is included. Promising reduction of coli-index and number of colonies were obtained with irradiation by using a low-pressure Ar-Hg lamp. The lamp was 55 mm. above the surface of the water, the depth was 75 mm., and the width of stream 140 mm. At 0.14 litters/seconds, this resulted in a 30-second exposure. (Work-North Carolina State)

WASTE WATER TREATMENT IN MODERN TEXTILE OPERATIONS (IN GERMAN),
H. F. Kuisel.
Oesterreichische-Abwasser-Rundschan, Vol. 11, No. 5, p80-84, 1966.

Descriptors: *Activated sludge, pH, Biochemical Oxygen Demand, Chlorine, *Legal aspects, Chemicals, Legislation, Color, Waste water treatment.
Identifiers: *Dyestuffs, *Textile mill wastes.

Utilization of Lake Constance as a drinking water reservoir, and an agreement between Austria, Germany and Switzerland, placed limitations on waste water discharged into the lake. The limitations suspended solids <0.3, organic solvents and extractable matter; by petroleum ether <10; B.O.D. <25; KMnO4 consumption <80 mg/liter, and absence of toxic matter; and temperature <30 deg. Activated sludge is poisoned by chemicals used in the textile industry (phenol, ureaformaldehyde, or mineral oils) as these are liberated in biological treatment. Collection and mixing of all effluents of a textile plant is a partial solution to this problem. Excess clorine decolorizes dyes in solution. The temperature can be controlled by a heat exchanger which also results in a fuel savings. The water is clearified and treated by activated sludge, to be used as an organic fertilizer. High pH and B.O.D. are reduced by aeration for 48 hours; hard detergents are to be excluded either by legislation or voluntarily. Phenol is to be removed in the plant by ion exchange, and may be recovered. Examples are given of treatment in various textile plants. (Work-North Carolina State)
W70-07977

DEVELOPMENT OF A METHOD FOR TREATING WASTE WATERS CONTAINING SULPHUR DYES FROM THE 'ASEN ZLATAROV' PLANT, ISKAR STATION, SOFIA (IN BULGARIAN),
Kh. Popov.
English Summary. Trudy Nauchnoizsledovatelskiya Institut Vodosnabzhenie Kanalizatsiya Sanitarnaya Tekhmika, Sofia, Vol. 2, p167-184, 1965.

Descriptors: *Chemical reactions, Chemical precipitation, Laboratory tests, *Waste water treatment.
Identifiers: *Sulfur dyes, *Dyehouse wastes, *Dyestuffs.

Laboratory tests showed that the most economical and effective method for the treatment of waste waters containing sulphur dyes was acidification with sulphuric acid to give a pH value of 3.5-4, followed by neutralization with lime to give a pH value of 8-8.5, the neutralization tanks being closed and slightly pressurized. The sulphur dioxide and hydrogen sulphide which are evolved react together and become harmless, and the treated waste water is suitable for discharge to the municipal sewer. Based on the results of the tests, which are given in tables and graphs, a treatment plant was designed and is shown diagrammatically. The pH value during acidification and neutralization will be controlled automatically. A period of 2-2.5 hours is required for sedimentation and 1-1.5 hours for neutralization. Alkaline sludge can be reused. (Work-North Carolina State)

TEXTILE WATER POLLUTION CLEANUP PICKS UP SPEED,
R. W. Pinault.
Textile World, Vol. 117, p52-66, 1967. 1 tab, 1 fig, 17 pictures.

Descriptors: *Cost Analysis, Lagoons, *Waste water treatment.
Identifiers: *Textile mill wastes, Dyeing, Fabric finishing, *Dyehouse wastes.

It is estimated that the textile industry will be required to spend $350 million dollars in the next 10 years to reduce the pollution from their plants to an acceptable level. For a plant dyeing and finishing 150 million yards of fabric a year, an added cost may be about one-tenth of a cent per yard. The operations of five plants are described. These are: (1) plant for the dyeing and bleaching of tricot

ric made from man-made fibers, (2) a plant ere color is removed by treating with lime and ting in a lagoon, (3) a plant where color was not roblem and uses aeration lagoons, (4) a printing d finishing plant using 9 to 10 million gallons of ter per day, and (5) a mill which can discharge waste water, after treatment, into a large fresh ter lake. ATER POLLUTION ABATEMENT BY IM-OVED COAGULATION OF EFFLUENTS OM LYE-PEEL POTATO PROCESSING ANTS,
rth Dakota Water Resources Research Inst, Far-

ilford O. Fossum, and Albert M. Cooley.
ailable from the Clearinghouse as PB-192 632, .00 in paper copy, $0.65 in microfiche. Research oject Technical Completion Report, Water sources Research Institute WI221-006-70, Jan 70. 29 p, 12 tab, 7 fig, 3 ref. OWRR Project A-2-NDAK (1).

escriptors: Coagulant aids, *Coagulation/COD duction, Floc formation, Food processing wastes, eonardite, *Lye-peel waste, Neutralization of ste, *Polyelectrolyte use, *Potato processing stes.
entifiers: Coagulation, Sedimentation, Zeta tential, *Pollution abatement, Potatoes, Humic ids, *Waste water treatment.

e lye-peel process produces a waste from the eling stage which is very high in organic content d has a pH of 12 or more. This high alkalinity and e colloidal nature of the organic solids make their moval by coagulation very difficult. Leonardite is naturally-occurring material consisting of humic ids. It can be made colloidal in water and then ecipitated as a floc or gel. The possibility of using s floc to aid in removing the organic solids from e-peel waste is discussed. The addition of onardite to lye-peel waste in combination with her prime coagulants formed a dense settleable c. However, at high values of pH, the floc was in-fective as it actually resulted in increased COD lues for the supernatant liquor after two-hour ttling. At neutral or acidic pH values the onardite did assist in removal of solids. Even in ese cases, however, the supernatant was not clear t was dark-colored from the unprecipitated onardite. The addition of polyelectrolyte coagu-nt aids further improved the COD reduction. The tionic polyelectrolytes were considerable more fective than nonionic ones. Lowering of the pH natural fermentation instead of by acid addition d not materially alter the results.

TATE OF THE ART REVIEW ON PRODUCT ECOVERY.
esource Engineering Associates, Wilton, Conn.

vailable from the Clearinghouse as PB-192 634, .00 in paper copy, $0.65 in microfiche. Water ollution Control Research Series, Nov 1969. 95 p, tab, 18 fig, 106 ref, 3 append. FWQA Project 7070 DJW--11/69, Contract No. 14-12-495.

escriptors: Waste water treatment, *Reviews, Waste treatment, Solid wastes, *Industrial wastes, quid wastes, *Byproducts.
entifiers: By-product recovery, *Recovery, Reuse, Product recovery, Industrial waste covery.

he recovery, reuse and sale of materials from quid effluents, or produced as a result of the treat-ent of liquid effluents is discussed. A critical view of literature up to date on product recovery major water use industries is presented. The conomical, technical and philosophical amework which determines the application of oduct recovery is presented wherever possible. his report does not cover water renovation for euse and product recovery from solid wastes. However, an evaluation of the utilization and product recovery of municipal sludge is presented. The principal areas of discussion are waste reduction practices including in-plant control, recovery techniques and practices, practical operating problems and the relationship between recovery and treatment. It is concluded that product recovery is an accepted practice with increasing usage; industry needs increasingly complex processes to develop optimum recovery schemes; by-product recovery results in a net cost to industry generally of a smaller magnitude than conventional treatment; and the situation is complicated by the tax exemption laws.

AEROBIC TREATMENT OF TEXTILE MILL WASTE,
E. L. Jones, T. A. Alspaugh, and H. B. Stokes.
Journal of the Water Pollution Control Federation, Vol 34, p 495-512, 1962.

Descriptors: *Aerobic treatment, *Activated sludge, *Contact stabilization, Biological treatment, Biochemical oxygen demand, Chlorination, *Waste water treatment.
Identifiers: *Textile mill wastes, Aerobic stabilization.

A full-scale, single-stage modification was made of the conventional activated sludge process to the contact stabilization process. The results of further pilot-plant studies on the biological treatment of textile waste waters in admixture with sewage at Greensboro, N.C. are given and discussed. Contact stabilization and prolonged aerobic stabilization modifications of the activated sludge process were investigated. The contact stabilization was found to give good results with mixtures in which about half the BOD load was contributed by textile wastes and reductions in BOD of 85-90% were obtained without chlorination; good color removals were also obtained. The Maitland, Ontario, plant of DuPont of Canada Ltd., manufactures nylon intermediates, 'Freon' flourinated hydrocarbons, and 'Orlon' acrylic fibers. The sources and nature of the principal contaminants in the waste waters are shown in a table, together with a method of disposal. Combustible wastes are burned. Dilute chemical wastes are settled for removal of oil, neutralized if necessary, and discharged on the bed of the St. Lawrence River at a depth of 46 feet and a distance of 1,000 feet from the shore. Waste waters relatively free from contaminants are collected in an off-the-shore line. Sanitary wastes are digested in an Imhoff tank and chlorinated before discharges. PROFITABLE USE OF WASTE MATERIALS IN COTTON MILLS,
Vasant Industrial and Engineering Works, Bombay (India).
V. S. Nathan.
Indian Textile Journal, Vol 64, p 763-764, 1954.

Descriptors: *Cotton, *Potassum compounds, Iron compounds, Waste water treatment, Industrial wastes.
Identifiers: *Textile mill wastes, Ferrous sulfate, Caustic soda, Tin compounds, *Alum, Lime, Chemical recovery.

Effluent waste water from the scouring and bleaching of cotton fabric can be treated with ferrons sulfate and air bubbled through it. Insoluble iron compounds settle out and after collection, the solids treated with sulfuric acid in order to recover fatty acids and iron sulfate. Potassium salts can be recovered from wool scouring wastes, in addition to the usual recovery of wool grease. The salts can be concentrated from the weighting of silk. Waste water from the mercerizing of cotton can be concentrated to recover the caustic in it after other impurities are removed by precipitation with alum or lime. (Work-North CarolinaState Univ)

POLLUTION CONTROL BY RECOVERY OF CAUSTIC SODA,
Solvay Process Div., Allied Chemical Corp., Syracuse, N.Y.
W. R. Steele.
American Dyestuff Reporter, Vol 44, No 12, p 400, 1955.

Descriptors: *Waste water treatment, Water pollution control.
Identifiers: *Caustic soda, *Recovery (Waste), *Textile mill wastes.

Eighty percent of caustic entering a bleachery operation is not consumed and can be recovered. The keys to recovery are washing out caustic on the tenter frame and increasing the concentration of caustic in wash liquors. Concentrated caustic solutions can be reused directly, and dilute solutions can be evaporated and concentrated for use in mercerization. High-purity caustic can also be removed. Efficient removal of caustic from cotton decreases shrinkage. (Sheffield-North Carolina State Univ)

BASIC STUDIES ON THE CLARIFICATION OF WASTE WATER CONTAINING DYES. I. PRECIPITATION OF DIRECT DYES BY FERRIC CHLORIDE,
H Iida, and N Kuwahara.
Representative Government Chemical Industries Research Institute, Tokyo, Vol 58, No 3, p 137-144, 1963.

Descriptors: *Chemical precipitation, Centrifugation, Sodium sulfate, *Waste water treatment.
Identifiers: *Flucculation, *Direct dyes, *Ferric chloride, Precipitation, Clarification, Dyehouse wastes, Dyestuffs.

In studies on the hetero flucculation of 5 direct dyes by ferric chloride from aqueous solutions, the precipitates were removed by centrifuging and the amount of unprecipitated dye was estimated colorimetrically. Precipitation was increased when the pH value was less than 5, and 95-100% of the dye was precipitated from a solution with 10 parts per million at pH 5 by the addition of 60-100 parts per million ferric chloride. Precipitation varied with the dye; some dyes precipitated in amounts less than 30% and others precipitated completely under the same conditions. With some dyes, precipitation was reduced by addition of sodium sulfate. (Robinson-North Carolina State Univ)

TREATMENT OF WOOL SCOURING LIQUORS,
E. W. Clark, and G. F. Kitchen.
Patent no. 1,029,114, May 11, 1965.

Descriptors: Flocculation, Filtration, Chemical precipitation, *Detergents, *Waste water treatment.
Identifiers: *Wool scouring, *Wool grease, *Ferrous sulfate, Sulfuric acid.

When synthetic detergents, rather than soap, are used to scour raw wool, it is quite difficult to separate the grease, suspended solids and dissolved solids from the waste water. A new and inexpensive method of so doing is based upon the use of ferrous sulfate (copperas). The preferred procedure is to treat the liquid with 0.2-1.5% of ferrous sulfate, blow with air at the boil, acidify with sulfuric acid to a pH of 1.0 to 4.0, boil for an hour, cool to room temperature and filter. By this process waste water containing about 2.0% wool grease, 3.5% total solids and possessing a 4 hour permanganate value of about 6000 p.p.m. can be reduced to 0.1%, 25 p.p.m. and about 3000 p.p.m., respectively. THE ECONOMICS OF BASE METAL RECOVERY BY ION EXCHANGE,
Permutit Company, Paramus, N.J.
A. B. Mindler.
Metallurgical Society Conferences, Vol 14, p 851-859, 1963. Science Publishers, New York, 1964.

Descriptors: *Waste water treatment, *Copper, Ion-Exchange, Copper compounds.
Identifiers: *Viscose rayon wastes, *Cuprammonium rayon plant wastes, *Zinc, Zinc compounds, Rayon plant wastes.

Waste waters from the manufacture of viscose rayon contain zinc which can be recovered by passing the water through cation exchange beds (Permutit Q) at a rate of 1 g.p.m. per cubic foot of bed. The solution eluted from the bed containing 12-14% zinc sulfate, is sent back to the process as make-up. Waste water from the manufacture of cuprammonium rayon, in the only plant in the United States, contains copper compounds in solution which is recovered by passing the solution through a bed of Zeo-Karb, a sulfonated coal. ALGAE HANDLED EFFICIENTLY BY AUGUSTA WATER DISTRICT,
Augusta Water District, Maine.
Sidney S. Anthony.
Water and Sewage Works, Vol 116, p 185-189, 1969. 1 fig, 6 photos.

Descriptors: *Algae, *Maine, *Water supply, Copper sulfate, Reservoirs, Water pollution, Microorganisms, History, Taste, Odor, Deep wells, Water treatment, Mechanical equipment, Pumping plants, Maine.
Identifiers: *Augusta (Maine), Carleton Pond (Maine), Synura, Asterionella, Typhoid fever, Kennebec River (Maine), Cobbosseecontee Lake (Maine), Barge.

The history of the Augusta, Maine, water supply after 1870 is described. At that time the Kennebec River was used as the source of water; in the winter of 1902-1903 widespread typhoid fever outbreaks, traceable to the water supply, caused the inauguration of a water district. Carlton Pond, the principal reservoir, was chosen by the Augusta Water District and placed in operation in 1906. The pond, however, is subject to periodic infestations of algae, primarily Synura, with Asterionella also present. To alleviate the taste and odor problem caused by algae, control measures are taken. A special barge and pumps were developed for application of copper sulfate (the only chemical used) in dilution of 0.35 milligrams/liter. The treatment is completed in one day, in the fall, when water turbulence is minimal, and application is made to the entire lake and shoreline. One treatment is usually adequate to eliminate the algae. (Jones-Wisconsin)

determination of the efficiency of algal removal various unit operations of potable water treatent process was made. Samples were collected at rious locations throughout the treatment plant d examined to determine kinds and numbers of gal forms present. The results indicate a wide sparity in the efficiency of algal removal among e several unit processes studied. Numerous ornisms pass the filters into finished tap water; unts as high as 44 organisms/milliliter were obned. Cyclotella and Chlorella appear with the eatest frequency in the plant effluent. The use of um as a coagulant seems moderately effective for gal removal, but lime appears to be much more ficient due to formation of heavy floc which enps the cells upon settling. Both types of filters effct a high degree of algal removal at the start of a ter run; the sand continues to show fairly efficient moval until the head loss goes above six feet. The thrafilt filter shows a higher number of algae ssing through the filter. The importance of mainining a chlorine residual is shown by the number algae found in the finished tap water. 5G. Water Quality Control

ROGERS V BOND BROS (WELL POLLUTED BY NEARBY CREOSOTE PLANT).

279 Ky 239, 130 SW2d 22-24 (1939).

Descriptors: *Kentucky, *Artesian wells, *Water pollution, *Creosote, Soil contamination effects, Cities, Impaired water quality, Pollutants, Industrial wastes, Oily wastes, Groundwater, Water pollution effects, Water supply, Railroads, Legal aspects, Judicial decisions, Water law, Groundwater movement, Municipal water, Remedies, Damages, Potable water, Explosions, Land clearing, Wood preservatives (Pesticides).
Identifiers: *Negligence, *Nuisance.

Plaintiff owned an artesian well which was the local municipal water supply source. Over a period of years, a creosote plant was operated in the vicinity of the well location, first by a railroad company, then by defendant. After acquisition, defendant used dynamite to clear timber on the property. Shortly thereafter, plaintiff discovered his well was so polluted with creosote that the water was unfit for drinking. He brought suit alleging that the careless operation of the plant and the use of dynamite had caused the contamination of his well. The court first noted tha the doctrine of absolute liability for one who harbors harmful substances on his property did not apply in Kentucky, and that the nuisance doctrine required the showing of continuing harm rather than an isolated invasion of rights. In holding for the defendant, the court stated that the evidence pertaining to the source of the creosote in the well was insufficient for submission to the jury. The court pointed out that the creosote pollution could have been the product of railroad company negligence and that defendant could not be liable since he was not a joint tort-feasor. The court also noted other possible sources of the contamination and ruled that plaintiff failed to prove a cause of action against defendant. (Hubener-Florida)
W70-07719

USE OF ACTIVATED SILICAIN WATER FOR TEXTILE FINISHING,
Brookneal Mills, Va.
Frederic A. Prisley.
Journal of the American Water Works Association, Vol 49, Pt 1, No 4, April 1957, p 459-463. 1 fig, 2 ref.

Descriptors: Flocculation, Rivers, Turbidity, Alkalinity, Ammonium compounds, Neutralization, Chlorine, Filtration, Waste water treatment.
Identifiers: *Activated silica, Alum, Sodium carbonate, Backwashing, Dyehouse wastes.

Activated silica increases speed of formation of aluminum floc as well as size, density, and strength. It is used at the Brookneal Filter Plant, which supplies a dyeing and finishing plant and the town of Brookneal, Virginia. The water comes from the Falling River and is quite soft. The raw water is allowed to settle and is then treated with alum and soda ash. Warm weather produces no problems other than rapid changes in turbidity and alkalinity due to heavy runoffs. Colder weather introduces problems of low turbidity and colder water, necessitating a maximum rate of filter operation. A test using PQN Sol A (the silicate), known as the N-sol process, was run, adding the sol in the flash mixer, and proved highly successful. Ammonium sulfate was used as a neutralizing agent in the test, but in permanent operation the chlorine itself was used. Installation of piping and a chlorine-feeding manifold was the major task necessary to put the system into operation. Results have shown that frequency of backwash was reduced, dumping of basins rose from every three months to every four weeks, filter rates were significantly increased, some chlorine residuals remained, and very little service was needed on the silica generator. (Lonon-North Carolina State)

USE OF TAXES, SUBSIDIES, AND REGULATIONS FOR POLLUTION ABATEMENT,
Clemson Univ., S.C. Water Resources Research Inst.
Hugh H. Macaulay.
Available from the Clearinghouse as PB-192 631, $3.00 in paper copy, $0.65 in microfiche. Water Resources Research Institute, Clemson University, Report No. 16, June 1970. 81 p, 6 fig, 29 ref. OWRR Project B-004-SC (9).

Descriptors: *Equilibrium prices, *Economic justification, *Welfare (Economics), Compensation, Taxes, *Water pollution control, Water quality, Regulation.
Identifiers: *Charges, *Subsidies, *Externalities.

The Knight and Coase articles on social costs (see W69-07188) are examined in the light of their relevance to water pollution. These articles emphasize the two-way nature of social costs that can be seen in congestion of highways. A mathematical presentation shows that the market solution of congestion is also Pareto-optimal. Forces that affect upstream and downstream costs are shown graphically and the optimal use of water quality derived. The presentation stresses the role of alternative opportunities and the public goods nature of water quality. A comparison of charges, subsidies, and regulations, shows that the latter two will result in an overdemand for stream quality. Charges are not subject to this defect. Externalities associated with water pollution are shown to conform to the Knight and Coase conditions; both upstream firms and downstream residents create external diseconomies for each other. As a consequence, the measures proposed for pollution abatement should be applied to all parties along the stream. The Buchanan, Stubblebein, Turvey argument that a charge must be coupled with a subsidy is shown to be inappropriate when all parties are charged for external diseconomies they create, or subsidized for those they forego. The relationship between pecuniary and technological externalities is discussed.

PHOTOSYNTHESIS AND OXYGEN BALANCE IN STREAMS,
Manhattan Coll., Bronx, N.Y. Dept. of Civil Engineering.
Donald J. O'Connor, and Dominic M. Di Toro.
Proceedings, American Society of Civil Engineers, J of the Sanit Eng Div, Vol 96, No SA2, Proc Paper 7240, p 547-571, April 1970. 25 p, 8 fig, 3 tab, 30 ref, 4 append.

Descriptors: *Mathematical studies, *Dissolved oxygen, *Photosynthetic oxygen, *Biochemical oxygen demand, *Time, Spatial distribution, Rivers, Streams, Steady flow, Temperature.
Identifiers: Algal oxygen source, Equation.

The equation expressing the dissolved oxygen balance in a flowing stream was mathematically formulated to include a time varying photosynthetic oxygen source. The solution to the equation was compared to diurnal dissolved oxygen data obtained from five streams for which the algal oxygen source was the primary cause of the diurnal dissolved oxygen fluctuation. A review of previous work was given and the theory used was presented. The importance of the nitrogenous component of BOD was also evident. The resulting agreement between the theoretical solution and the data indicated that the equation presented was an adequate representation of the dissolved oxygen balance in a time varying as well as spatially varying situation. The five rivers selected for analysis were the Grand River, the Clinton River, and the Flint River in Michigan; the Truckee River in Nevada, and the Ivel River in Great Britain. The data available was obtained during periods when a reasonable

approximation of a steady-state flow and temperature prevailed. Fourier analysis of photosynthetic oxygen source and time varying deficit of DO were described in the appendices. (Kriss-Cornell)

MASONITE CORP V STEEDE (RELATIVE RIGHTS OF WATER USE AND DAMAGES FOR INDUSTRIAL POLLUTION).

23 So 2d 756-760 (Miss 1945).

Descriptors: *Mississippi, *Fishkill, *Competing uses, *Damages, Colloids, Effluents, Water pollution sources, Industrial wastes, Pulp wastes, Organic matter, Organic wastes, Path of pollutants, Pollutants, Water pollution effects, Riparian rights, Navigable waters, Relative rights, Riparian waters, Watercourses (Legal), Industrial plants, Judicial decisions, Legal aspects.

Plaintiff sought damages for the destruction of her business, a fishing resort on a navigable river. The destruction was allegedly the result of effluent which defendant corporation allowed to escape into the river. The court held that plaintiff and others who could gain access to the river had the right to take fish therefrom. Plaintiff had the right to control access to the river via her property. The court stated that damages were recoverable, for the destruction of these rights, and the related right to profit from business. The jury was warranted in finding that defendant's action materially contributed to, if not solely caused, the destruction of plaintiff's business. The court found, however, that plaintiff had not proved with reasonable certainty any loss of profits or damages, but went on to say that she was entitled to actual damages if she could prove them, and nominal damages if she could not. Furthermore, defendant could be held liable only for its proportionate share of the damage inflicted. (Price-Florida)

ULTRASONIC EMULSIFICATION OF OIL TANKER CARGO, FEASIBILITY STUDY USING AN ULTRASONIC PROCESS TO EMULSIFY PETROLEUM TO REDUCE OIL SLICK HAZARDS IN EVENT OF SPILLAGE AT SEA.
Sonics International, Inc., Dallas, Tex.

Available from the Clearinghouse as PB-192 633, $3.00 in paper copy, $0.65 in microfiche. Water Pollution Control Research Series, Apr 1970. 164 p, 58 tab, 86 fig. FWQA Program 15080-DJQ 04/70.

Descriptors: Toxicity, Tanker, *Water Pollution Control, *Emulsions Safety, Evaluation, Costs, *Emulsifiers, *Dispersion, *Oil spills, Oily water, Oil-water interfaces.
Identifiers: Continuous process, Ultrasonics, Transportation, Flammability, Tanker.

The purpose of this project was to study the feasibility of producing emulsified oil at a rate comparable with conventional tanker loading rates and to investigate the economic and ecological factors. To determine blender parameters and emulsified oil characteristics, two crude oils and one fuel oil were chosen. A Libyan light oil, a Venezuelan oil and No. 6 Fuel Oil were used. Only two emulsifiers were used and they were base-neutralized sulfonated nonionics. These are compatible with sea water and of low toxicity. The emulsions tested were oil-in-water. Oil was the internal phase and 97% of the total. Water and chemical was the external phase and 3% of the total. The tests on the emulsions were to determine: stability under simulated transportation conditions, dispersibility in sea water, toxicity to fish, and product alteration. Included were tests with safety aspects: evaporation rates, flash points, vapor pressures and rupture leak tests. An economic study was made which shows emulsification costs of about 20 cents per barrel without considering possible offsets or side benefits.

FAIRWOOD BLUFFS CONSERVANCY DISTRICT V IMEL (DISCHARGE OF RAW SEWAGE INTO OPEN DITCH).

255 NE2d 674-684 (Ind Ct App 1970).

Descriptors: *Indiana, *Sewage, *Easements, *Waste disposal, Cities, Right-of-way, Municipal wastes, Sewage districts, Water pollution sources, Sewage treatment, Ditches, Sewage disposal, Local governments, Waste water (Pollution), Damages, Erosion, Environmental effects, Bank eerosion, Judicial decisions, Legal aspects, Remedies.

Defendant water conservancy district obtained an easement across plaintiffs' property for construction of an enclosed sanitary sewer and an open ditch to carry storm water. The conservancy district promised that the storm water drain would never carry raw sewage or excessive quantities of water. Subsequently, large quantities of water were directed throught the storm drainage ditch causing erosion of its banks. Raw sewage was also conveyed through the open ditch and plaintiffs were forced to abandon their home. In this action plaintiffs sought damages for nuisance, an injunction for its abatement, and cancellation of the easement. The appellate court affirmed the trial court's granting of damages, holding that the district was liable for damages in a civil action, as would be a municipal corporation, for creating and maintaining a nuisance by discharging raw sewage onto plaintiffs' land. (Hubener-Florida)

GRIGSBY V BD EDUC OF FLOYD COUNTY (CONSTRUCTION OF SEWAGE PLANT UPSTREAM FROM MUNICIPALITY).
542 SW2d 827-838 (Ky 1970).

Descriptors: *Kentucky, *Sewage treatment, *Municipal water, *Treatment facilities, Local governments, Water pollution, Waste treatment, Legislation, Administration, Water pollution control, Effluents, Public health, Water supply, Reasonable use, Water quality, Administrative agencies, Streams, Potable water, Adjudication procedure, Remedies, Sewage disposal, Sewage, Judicial decisions.

Defendant board of education obtained approval from the state Water Pollution Control Commission for a sewage-disposal system to be used in connection with a new high school situated on a certain creek. Plaintiffs, representing the citizens of a town downstream, sought to prevent construction of the disposal system alleging it would pollute the stream which furnished their public water supply. The court, pointing to substantial evidence indicating that the plant would adequately fulfill its purpose without causing pollution, held for defendants. The court stated that in such circumstances its scope of review was limited as to whether the action of the Commission was arbitrary, capricious or unreasonable. Since the action of the Commission was supported by substantial evidence, the court refused to overturn it. (Hubener-Florida)

DAHLSTROM V CITY OF WHITEHALL (MUNICIPAL REGULATION OF INDUSTRIAL SEWAGE DISCHARGE).
14 Mich App 349, 165 NW 2d 443-445 (1969).

Descriptors: *Michigan, *Sewers, *Local governments, *Regulation, Taxes, Legal aspects, Judicial decisions, Legislation, Sewage disposal, Outlets, Sanitary engineering, Municipal wastes, Administration, Planning, Industrial wastes, Industries.

Plaintiff taxpayer brought an action to have a amendment to one of defendant's city ordinance declared unconstitutional and an action for a wr of mandamus to compel the mayor of defendar city to require Genesco, a large business concern to connect its buildings to the city sewer system The ordinance before amendment required all r sidents with sewage to connect their sewer line wit a public sewer main if there was one within 100 fe of their property line. The ordinance was amende to require residents to connect if the buildings o their property were within 100 feet of a publi sewer main. Genesco's property abutted a publi sewer line but its buildings were more than 100 fe from a public sewer line. Plaintiff sought to sho that the amendment was passed solely to exemp Genesco from connecting with the city sewe system. The trial court held that plaintiff failed t state a cause of action. On appeal, the case was re manded because the trial court failed to state an reasons for its dismissal of the action; consequentl the appellate court could not rule whether or no the trial judge had abused his discretion i dismissing the action. (Barnett-Florida)
W70-08018

MASONITE CORP V STEEDE (RELATIV RIGHTS TO USE OF WATER--DAMAGE RESULTING FROM WATER POLLUTION).
21 So 2d 463-466 (Miss 1945).

Descriptors: *Mississippi, *Fishkill, *Competin uses, *Damages, Colloids, Effluents, Water pollu tion sources, Industrial wastes, Pulp wastes, Or ganic matter, Organic wastes, Path of pollutants Pollutants, Water pollution effects, Riparian rights Navigable waters, Relative rights, Watercourse (Legal), Industrial plants, Riparian waters, Judicia decisions, Legal aspects.

Plaintiff owned a fishing resort which was locate on a river into which fed a creek. The creek serve as a conveyance for wood fiber effluent from de fendant manufacturing plant. Plaintiff sued for los of business occasioned by said pollution. Plaintif received judgment at the trial court and defendan appealed. The court held that the plaintiff coul recover, if at all, only when it clearly appeared tha because of the killing of the fish the profits of plain tiff's business were less than they would have bee had the fish not been killed. That consequence wa not sufficiently shown so as to warrant a jury ver dict for plaintiff; consequently, defendant shoul have received a directed verdict below. (Price Florida)

Identifiers: *Nuisance.

Plaintiff owned farmland on which he raised crop and pigs. Defendant owned a gas station on adjoin ing land. A break occurred in a pipeline to a tan on defendant's property and over 800,000 gallon of gas escaped into the ground. A year and a hal later plaintiff claimed gasoline appeared in the wel on his land. In an action for nuisance, plaintiff al leged that the gasoline had percolated in ground waters to plaintiff's premises, polluting his wate

pply and causing the deaths of his pigs. The court nd that the defendant was negligent in handling gasoline. However, in holding for the defen- nt, the court held the evidence insufficient to ablish that gasoline had entered plaintiff's well l stream or was the cause of death of the hogs. stimony that the water had the taste of gas, or an y appearance, was not sufficient to prove that gasoline spilled on defendant's ground had in- led plaintiff's water supply. Moreover, the dence tended to show that the groundwater pe from defendant's premises did not lead in the ection of plaintiff's well. (Hubener-Florida)

ntifiers: Cemeteries.

nsidered herein is the liability in damages for, or enjoining of, the pollution of subterranean ers. A definitional section explains the terms d in the annotation. Various aspects of the ts and liabilities of parties who pollute subter- ean or percolating waters form the bulk of this k. Major cases in various jurisdictions are cited authority for the propositions presented in the y of the text. Generally, the areas considered : (1) liability for the pollution of waters whether colating or in subterranean streams; (2) the t to enjoin the continuance of an existing or a sible future pollution; (3) whether liability ex- under a charge of negligence or nuisance; (4) sources of pollution of subterranean waters in- ding refineries, cesspools, privies, oil and gas ks, saline intrusion, municipal wastes, manure, d animals and the like; and (5) injunctions inst the establishment of cemeteries if pollution kely to result. A distinction is made between the erican rule of reasonable use and the English e of absolute ownership. (See also W70-08050 W70-08051). (Barnett-Florida)
W70-08049

LIABILITY FOR POLLUTION OF SUBTERRANEAN WATERS (THE DISTINCTION BETWEEN SUBTERRANEAN STREAMS AND PERCOLATING WATERS).

38 ALR2d p 1269-1272 (1954)

Descriptors: *Percolating water, *Water pollution, *Seepage, *Subsurface waters, Groundwater, Underground streams, Subsurface runoff, Reasonable use, Prior appropriation, Water pollution sources, Judicial decisions, Legal aspects, Deep percolation.

With regard to liability for their pollution, a clear distinction is made between well-defined subterranean streams and percolating waters. The general rule is that the owner of land abutting on a surface stream may not pollute it to the injury of other ripparian owners. This same rule was found applicable in Rhode Island to subterranean streams following a well-defined course, but not so for waters passing by percolation or seepage. In Michigan, an inadvertent and non-negligent pollution of subterranean waters was held to be not actionable. The problem of differentiation between 'flow and seepage' is discussed with regard to liability for pollution of a well by seepage where a contrast was drawn only to impose liability for the flow of certain waters. (See also W70-08049 and W70-08051). (Barnett-Florida)
W70-08050

LIABILITY FOR POLLUTION OF SUBTERRANEAN WATERS (NEGLIGENCE FOR THE POLLUTION OF SUBTERRANEAN WATERS OR NUISANCE ACTIONS).
38 ALR2d 1265-1306, p 1285-1290 (1954).

Descriptors: *Percolating water, *Seepage, *Water pollution, *Subsurface waters, Deep percolation, Underground streams, Damages, Oil wells, Water pollution sources, Judicial decisions, Legal aspects, Remedies, Adjudication procedure.

The theories of negligence or nuisance are two grounds for the recovery of damages or for an injunction against the pollution of subterranean streams. Where it is found that the existence of a nuisance caused the pollution of subterranean waters, continuance of the nuisance may be enjoined or damages recovered. Examples of such nuisances are the improper burying of a cow, the improper location of a grave site, or the disposal of sewage so as to cause damage to the health or welfare of society. Two rules are used to impose liability for the pollution of subterranean waters. The American rule states that in the absence of negligence there is no liability if there was legitimate or a reasonable use of the defendant's property. The common law rule is that one must in all events so use his property as not to injure the legal rights of his neighbors. The different jurisdictions that adhere to either one or the other of these rules are listed. (See also W70-08049 and W70-08050). (Barnett-Florida)

RACINE V CATHOLIC BISHOP OF CHICAGO (STREAM POLLUTION AS A CONTINUING NUISANCE).
290 111 App 284, 8 NE2d 210-212 (1937).

Descriptors: *Illinois, *Water pollution, *Odor, *Sewage disposal, Streams, Sewage, Riparian rights, Surface waters, Judicial decisions, Legal aspects, Air pollution effects, Water pollution effects, Open channels, Damages, Water pollution sources, Remedies, Relative rights.
Identifiers: Nuisance (Continuing).

Plaintiff owned land which he subdivided for the purposes of sale. Defendant erected a seminary in the vicinity of this land. Plaintiff alleged that defendant allowed the sewage from the seminary buildings to flow into a creek that bordered plaintiff's land and thus filled the air with noxious odors, destroying plaintiff's business. The trial court directed a verdict for defendant. Plaintiff appealed, alleging a total loss of value in his land. Defendant contended that the alleged nuisance was a continuing nuisance, not a permanent one. The appellate court agreed and held that the pollution of a stream by sewage is a continuing nuisance and that judgments at law are held to afford compensation only for the injury sustained to the time of such judgment and not for future damages. Since the record failed to show a proper allegation of damages by the plaintiffs, the trial court's judgment was affirmed. (Barnett-Florida)

SIMON V HUDSON COAL CO (DISCHARGE OF MINE DRAINAGE INTO DITCH).

350 Pa 82, 38 A2d 259-262 (1944).

Descriptors: *Pennsylvania, *Mine water, *Mine drainage, *Discharge (Water), Coal mines, Waste dumps, Mine waster, Ditches, Water release, Effluents, Streamflow, Waste dilution, Conduits, Drainage engineering, Banks, Overflow, Judicial decisions, Legal aspects, Relative rights.
Identifiers: *Negligence.

Plaintiff owned property through which ran a ditch that originated in defendant's coal mining area. Defendant discharged drainage water into the ditch at irregular intervals. Following one discharge that increased the depth of water in the ditch by three to six feet, plaintiff's son fell into the ditch and drowned. Plaintiff brought action for damages. Plaintiff contended defendant was negligent in discharging such quantities of water without giving notice to children near the watercourse. The court gave summary judgment for defendant, holding that he had a legal right to discharge water into the stream without any liability to lower owners so long as the banks of the ditch were not overflowd. The defendant was held not negligent for failing to provide warning since the child fell into the water after the level had been raised and since notice of the discharge would not have prevented the child from playing along the ditch. (Hubener-Florida)

COMMONWEALTH V DOUGHERTY (POLICY BEHIND LICENSING OF PLUMBERS).

40 A2d 902-904 (Pa 1945).

Descriptors: *Pennsylvania, *Plumbing, *Regulation, *Water quality control, Drainage, Industrial plants, Sewers, Pipes, Construction, Legal aspects, Industrial wastes, Legislation, Public health, Judicial decisions, Permits, Sewage, Drainage effects, Impaired water quality, Water pollution, Engineering structures.
Identifiers: Licenses.

Appellant steamfitters tapped a subsidiary water pipe which connected a city water main with tanks located in the factory where appellants were engaged in construction work. From these tanks, which contained mercury cyanide solution, water was drained into a nearby sewer. Appellants were charged and convicted of performing plumbing work without plumbers' licenses, in violation of the state plumbing code. Appellants maintained the statute in question was unconstitutional on the ground that the legislature arbitrarily invaded the personal property rights of the appellants and unnecessarily interfered with their personal liberty under the guise of proper police regulations. The appellate court, however, affirmed the convictions and held that the control of connections with the city's water pipes bears a vital relation to public health since improper connections could lead to a contaminated water supply and inadequate drainage facilities. Consequently, the statute was a valid exercise of the police power. (Finman-Florida)

COMMONWEALTH EX REL MCCORMICK V PHILADELPHIA AND R COAL AND IRON CO (POLLUTION OF RIVER BY COAL MINING OPERATION).

347 Pa 602, A2d 19-22 (1943).

Descriptors: *Pennsylvania, *Water pollution, *Coal mine wastes, *Pollution abatement, Rivers, Water pollution sources, Legal aspects, Judicial decisions, Industrial wastes, Sedimentation, Groundwater movement, Dredging, Municipal water, Cities, Relative rights, Mine drainage, Coal mines, Remedies, Mine wastes, Mining, Water supply.
Identifiers: *Injunction.

Defendant company carried on coal mining operations and permitted coal dirt and mine refuse to wash into and pollute a river which was the water supply of plaintiff city. In a prior action in 1907 the court had denied injunctive relief against defendant upon finding that it had begun to impound its wastes. However, the court did grant plaintiff leave to re-apply for any orders necessary to ensure abatement of the pollution. The contaminating mines were subsequently leased to other corporations whose activities caused pollution of the river. Plaintiff, along with other intervening cities, brought action pursuant to the 1907 decisions, sought to join defendant and its lessees, and applied for an injunctive order against the pollution of the river. Plaintiff also asked that defendants be ordered to pay the costs of dredging sediment deposited in the river by defendants' mining operations. The court held that the application for an injunction was not within the terms of the original decree and defendants were entitled to a trial. (Hubener-Florida)

APPLICATIONS OF FLUORESCENT TRACER TECHNIQUES IN POLLUTION CONTROL STUDIES,
Beak (T.W.) Consultants Ltd., Montreal (Quebec).
P. L. Timpany.
Pulp and Paper, Vol 71, No 7, T145-T148, 1970. 8 fig, 8 ref.

Descriptors: *Tracers, *Water pollution control, *Dye releases, Fluorometry, Mixing, Evaluation, Water measurement, Dispersion, Time, Pulp and paper industry, Surfaces, Effluents, Analysis, Stratification, Analytical techniques, Tagging, River flow, Flow rates, Dispersion, Data collections, Pulp wastes.
Identifiers: Dilution, Fluorescent dyes, Rhodamine WT, Newfoundland.

Fluorescent tracer techniques are efficient tools in water pollution control studies. Large or small quantities of water may be tagged by the techniques outlined to study water distribution under any flow or mixing conditions. All fluorescent tracers are temperature dependent and must be calibrated and analyzed at a constant temperature or adjusted to calibrated temperature. Rhodamine W T (Dupont) is recommended for most long term studies of surface waters or flow studies of concentrated waste effluents occurring in 5-day pulp and paper mill aerated lagoons. Valuable information can be obtained relatively easily for flow rates, time-of-travel, dispersion, dilution, mixing, stratification, short-circuiting, and stagnant volumes. It is especially significant in evaluating the effects of spills or accidental dumps of soluble pollutants on water users downstream from a particular outfall. The field of fluorometric analysis makes it possible to measure accurately and analyze natural and industrial hydraulic processes including those of protection against shock loading, effects of hydraulic short-circuiting or stratification, aerator mixing capabilities, and volumetric measurement of stagnant or dead areas. SIMULATION MODELING OF THERMAL EFFLUENT IN AN IRRIGATION SYSTEM,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
D. E. Peterson, and R. T. Jaske.
AEC Research and Development Report, BNWL-1277, UC-70, Pacific Northwest Laboratories, Richland, Jan. 1970. 21 p, 11 fig.

Descriptors: *Temperature, *Canals, *Irrigation, Heat transfer, Meteorological data, Evaporation, Conduction, Radiation, Water pollution control, *Simulation.
Identifiers: *Thermal effluent, COLHEAT simulation system, Advected heat, Flow records.

Simulations of hourly average water temperatures along a 40 mile reach of the Phelps county canal of south-central Nebraska were carried out by utilizing moving means of hourly regional weather data as input to the COLHEAT computer program. The COLHEAT simulation model applied a heat budget to a given section of a river or canal. The water temperature for a section Tw is determined. The simulation of the addition of a 500% increase in heat rejection to the canal system indicated a large potential sink capability for future expansion of the system without extensive modifications of the simulated thermal history. The computed rates of heat transfer from the canal indicate overall coefficients as high as 700 BTU/ (day) (ft2) (deg F) compared to 100-200 BTU/ (day) (ft2) (deg F) for lakes and ponds. Neither benefits nor liabilities to agriculture resulted from water temperature modification. (Upadhyaya-Vanderbilt)

MASONITE CORP V DENNIS (BURDEN OF PROOF FOR POLLUTION DAMAGE).

168 So 613-616 (Miss 1936).

Descriptors: *Mississippi, *Riparian land, *Industrial wastes, *Wood wastes, Water pollution, Public health, Pollutants, Pollutant identification, Wastes, Effluents, Water pollution sources, Industrial plants, Judicial decisions, Legal aspects, Remedies, Regulation, Depreciation, Productivity, Fibers (Plant), Upstream, Discharge (Water), Damages, Deposition (Sediments), Fish kill, Property values.

Defendant's manufacturing plant discharged waste products, consisting primarily of wood fiber, at a point fifty miles upstream from plaintiff's land. Plaintiff alleged that as a result of such discharge a sediment, as well as large numbers of dead fish, were deposited on his land, thereby adversely affecting the land's productivity. Plaintiff brought action for damages for the depreciation in value of the land. Defendant maintained that the effluent from its plant alone could not have destroyed animal life in the stream but would have had to be joined by effluents from other nearby sources. Also, although defendant discharged a million or more gallons of water and wood fiber into the stream daily, the amount of wood fiber was infinitesimal as compared to the immense volume of water discharged. The court took notice of the fact that polluted water would purify itself within a reasonably short distance, and that fish within a short distance downstream from defendant's plant were not normally destroyed by the effluent therefrom. The court concluded that since there was also a great distance from defendant's plant to plaintiff's land, there was no evidence to establish defendant's liability to plaintiff. (Finman-Florida)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

THE DEVELOPMENT OF A MODEL TO EVA UATE HYDROLOGIC RISK IN A WAT RESOURCE SYSTEM,
Battelle Memorial Inst., Richland, Wash.; Texas A and M Univ., College Station.
William L. Bathke, and R. J. Freund.
Water Resources Bulletin, Vol 5, No 1, p 53-March 1969. 9 p, 15 ref, 3 fig.

Descriptors: *Economic analysis, *Risks, *Wa supply, *Irrigation design, *Simulation analy *Probability, Prices, Floods, Benefits, Optimi tion, Reservoir, Water inflow, Hydrologic aspe Computers, Economics, Watersheds, Model s dies, Storage capacity, Stream flow, Co Economic evaluation, Water resource planni Operations research, Dynamic programming, rigation efficiency.
Identifiers: *Irrigation development, *Surf technology, Operational hydrology, Hydrolo risks.

A technique is described for analyzing a wa resource sytem whose inflow is highly variable. T use of this technique requires not only that mathematical model be developed of the physi hydrological and economic characteristics of water resource sytem under study, but also t there be an economic evaluation of the benefits the system, including full and partial water deli ries for irrigation development. Data from watershed in the South Concho River, Texas v used. A region of tolerable water shortages v computed and a three-dimensional economic l function derived. A response surface of net ben was then fitted to the resulting net benefits of various design combinations. Standard respo surface technology was used to derive the optim combinations for a desired irrigation developm level. (Murphy-Rutgers)

E ELEMENTS OF INPUT-OUTPUT ANALY-

st Virginia Univ., Morgantown. Regional earch Inst.
liam H. Miernyk.
v York, Random House, 1965. 156 p.

scriptors: *Input-output analysis, Leontief dels, Statistical methods, Economic, Industries, ecasting, Regional analysis.
ntifiers: *econometrics, *Input-output table, nsaction, Sectors, Technical coefficients, chases, Stability conditions, Multiplier analysis, ployment multiplier, Interregional analysis, velopment.

e author presents the essentials of input-output lysis in nonmathematical terms, although a cer- amount of arithmetic is used to illustrate vari- steps in the analysis. The book is concerned y with input-output analysis rather than with the istical problems involved in the construction of nput-output table. The last chapter of the book cusses the rudiments of input-output mathe- tics. Most of this book deals with a static, open ut-output model. This model is the type upon ch the 1947 tables for the United States were ed. Input-output analysis has been used exten- ly in the water area. For example, such a nique has been used in an analysis of western er resource development. In light of its promis- uses in the water area, this book will be of value he water researcher unfamiliar with input-out- analysis. (Loeb-Rutgers)

CUNIARY AND TECHNOLOGICAL EXTER- LITY, FACTOR RENTS, AND SOCIAL STS,
shington Univ., Seattle.
an A. Worcester, Jr.
erican Economic Review, Vol 59, No 5, p 873- , December 1969. 4 fig, 1 tab, 23 ref.

scriptors: Rent, Welfare, Prices, Alternative ts, Marginal costs, Average costs, Competition, nand, Monopoly.
ntifiers: *Pecuniary externality, *Technological ernality, Externalities, Factor rents, Social costs, rginal products, Opportunity cost, Production ction, Monopsony.

his paper the author considers the effects of uniary and technological externalities in a classical analysis. The author concludes that all ernal effects are found in principle to be reduci- by correct input pricing to economies or dis- nomies. This holds for separable and non- arable externalities in production and for exter- ties viewed either in terms of specific firms or ong industries. Different industry structures duce optimal allocation either for technological or pecuniary externalities if the externalities are rnal to an industry and the firms therein use the e factor proportions. When these conditions do hold, only competitive structures and pecunia- externalities suffice to produce an optimum in absence of complicated combinations of taxes subsidies which require a wealth of accurate ailed data. This article may prove to be of in- st to the water researcher investigating the ef- s of externalities of water production. (Loeb- gers)

MANAGEMENT'S NEW ROLE,
New York Univ., N.Y. Graduate School of Business Administration.
Peter F. Drucker.
Harvard Business Review, p 49-54, November-December 1969.

Descriptors: *Management.
Identifiers: Social responsibility, Science, Discipline, Economic development, Entrepreneurial innovation, Humanity.

The author reviews five assumptions that may have formed the foundation of the theory and practice of management in the last half century. These assumptions deal with the scope, the task, the position and the nature of management. These assumptions were: (1) Only business has 'social responsibility.' (2) Entrepreneurship and innovation lie outside the management scope. (3) It is managements' task to make the manual worker productive. (4) Management is a 'science' or at least a 'discipline.' (5) Management is the result of economic development. The author argues that many of these assumptions have become obsolete and formulates five new assumptions which correspond to the management realities of today. These new assumptions are (1) all institutions, including business, are accountable for the 'quality of life.' (2) Entrepreneurial innovation will become the core of management. (3) It is management's task to make knowledge more productive. (4) Management will have to be considered as both a 'science' and a 'humanity.' (5) Economic and social development are the result of management. The author contends that these new assumptions are better guides to effective management. This discussion would be helpful to the water manager who must use science and the natural environment in order to achieve water needs and maintain the quality of life. (Loeb-Rutgers)

DYNAMIC PROGRAMMING OF ECONOMIC DECISIONS,
Martin J. Beckmann.
New York, Springer-Verlag Inc, 1968. 143 p.

Descriptors: *Dynamic programming, Mathematical studies, Economics, Operations research, Technology, Sequence, Risks, Linear programming, Stability, Resource allocation, Constraints.
Identifiers: *Economic decisions, Mathematical theory, Discrete sequences, Continuous sequences, Continuous decision variables, Discrete decision variables, Certainty, Finite alternatives, Optimality, Value function, Machine care, Inventory control, Exponential weighting, Turnpike theorem, Sequential programming.

Dynamic programming is the analysis of multistage decision in the sequential mode. It is now widely recognized as a tool of versatility and power, and is applied to an increasing extent in all phases of economic analysis, operations research, technology, and also in mathematical theory itself. In this monograph the reader is introduced to the basic ideas of dynamic programming. An attempt is made to show the breadth of this method by a careful exposition of its principles followed by some typical applications to economic analysis, operations research and decisions making in general. Some effort has been made to give a systematic exposition of the various possibilities: discrete and continuous sequences; discrete and continuous decision variables; certainty, risk, and uncertainty. Dynamic programming has proven to be quite applicable in the water area for solving such problems as the optimal sequencing of water supply projects. (Loeb-Rutgers)

ON THE SOCIAL RATE OF DISCOUNT: COMMENT III,
California Univ., Berkeley.
Carl Landauer.
American Economic Review, Vol 59, No 5, p 917-918, December 1969. 6 ref.

Descriptors: Demand, Risks, Time.
Identifiers: *Social rate of discount, Time preference, Mission, Irreversibilities, Disproduct.

The author provides an additional argument of why the search for a unitary, optimal rate of social discount is futile. The author considers a factor which in historically important instances has increased the difference between private and public time preference in the minds of at least some members of a community. This factor is that of a sense of national mission requiring heavy present sacrifice for the sake of the future. The Tullock objection to this is discussed (i.e. that the next generation will be wealthier than us) as well as the counterarguments to this such as the impossibility of restoring the fertility of the soil or the beauty of the land once they have been destroyed. The author points out that some public investments have a close relationship to our private fortunes while others have a much looser relationship to our personal lives. These arguments would be directly applicable to the water area where a sense of national mission may be influential as a catalyst for water project investment decisions. (Loeb-Rutgers)

A GEOMETRIC TREATMENT OF AVERCH-JOHNSON'S BEHAVIOR OF THE FIRM MODEL,
Bell Telephone Lab., Inc.
E. E. Zajac.
American Economic Review Vol LX, No 1, p 117-125, March 1970.

Descriptors: *Model studies, *Cost minimization, *Rate of return, Capital, Profits, Management, Resource allocation, Economic efficiency, Prices, Technology.
Identifiers: *Firm regulation, *Social costs, Geometric analysis, Stockholders equity, Rate regulation.

The Averch-Johnson model of the regulated firm concluded that a profit-maximizing firm, regulated on fair rate of return, operates inefficiently in the sense that social cost is not minimized at the output selected and that the firm adjusts to the regulatory constraint by substituting capital for labor. Thus, regulated firms are driven to socially undesirable operations. This article gives a geometric analysis of the model and discusses its conclusions. The author examines the behavior of the firm and its regulators and replaces the profit maximization hypothesis is with that of maximizing rate of return on equity. An attempt is also made to model the effect of the labor constraints to which the firm is subject. The last section examines the rate base expansion by acquisition of nonproductive capital in order to show how it differs from the Averch-Johnson effect. The article has particular relevance for the water resource area where water utilities are subject to the regulatory process. (Murphy-Rutgers)

STRATEGY FOR FINANCIAL EMERGENCIES,
Harvard Univ., Boston, Mass. Graduate School of Business Administration.
Gordon Donaldson.
Harvard Business Review, p 67-79, Nov-Dec 1969. 2 charts, 1 ref.

Descriptors: *Risks, Financing, Model studies, Management, Computers.
Identifiers: *Financial emergencies, *Contingency planning, Contingency analysis, Inventory, Reserves, Strategy, Information system, Cash-flow computer model, Financial mobility.

Uncertainty has always been a part of business experience. However, current planning techniques and the philosophy of management by goals and objectives seem insensitive to unexpected change.

With business uncertainties increasing as the nation attempts to readjust its commitments abroad and solve major social and economic problems at home, the need for formal planning to cope with unexpected deficit in funds flow becomes important. In this article the author suggests three steps in a strategy for dealing with financial emergencies around which a new approach to the problem can be organized. The first step is to provide the company with an information system capable of analyzing data about the likely course of events in the future. The second step in contingency planning is the preparation of inventory of resources of financial mobility. The third step is the formulation of a strategy for dealing with the unknown. This approach might be quite helpful to the water planner whose investment decisions are often beset by the uncertainties of the political system. (Loeb-Rutgers)
W70-07749

ON THE SOCIAL RATE OF DISCOUNT: COMMENT V,
Queen's Univ., Kingston (Ontario).
Dan Usher.
American Economic Review, Vol 59, No 5, p 925-929, Dec 1969. 1 fig, 2 ref.

Descriptors: Interest, Risks, Taxes, Discount rate, Welfare.
Identifiers: *Social rate of discount, Consumption, Time preference, Opportunity cost.

Referring to Baumol's recent paper, the author contends that the choice of discount rate cannot be literally indeterminate if the correct rate can be found using the theory of the second best. Even when the rate of time preferences differs from the rate of opportunity cost in the private sector, an optimal rate of discount for the public sector is implied by the rules for maximizing the welfare of the community in the choice of public and private goods. Using the method developed by Lipsey and Lancaster the author shows how to choose the interest rate on government projects and proves that, under quite general assumptions, the appropriate interest rate on government projects lies between the rate of time preference and the rate of opportunity cost between present and future consumption in the private sector. This may prove valuable to the water researcher in light of the impact of interest rates on his investment decisions. (Loeb-Rutgers)

THE EXISTENCE OF AN OPTIMAL ECONOMIC POLICY,
California Univ., Berkeley; and Iowa State Univ., Ames.
T. Krishna Kumar.
Econometrica, Vol 37, No 4, p 600-610, Oct 1969. 21 ref.

Descriptors: Mathematical studies, Mathematical models, Economics, Linear programming.
Identifiers: *Optimal economic policy, Optimal policy, Planning horizon, Control variables, State variables, Optimal control, Helby's Theorem.

In its most general form an optimal economic policy is characterized as an optimal choice among alternative feasible time paths in transforming the economy from a given initial state to a desired final state at the end of a planning horizon. Since the mathematical description of the economy consists of variables, some of which are control variables, while the rest are the controlled variables or the state variables, the problem is analogous to the structure of optimal control policies. The question of the existence of optimal economic policies in dynamic models posed recently by Chakravarty and Yaari is examined here within a more general framework. In the particular case of a linear model, the problem can be shown to be equivalent to a continuous (or infinite) linear programming problem. The existence of optimal policy in this use is equivalent to the duality theorem for a continuous linear programming problem. This analysis would prove applicable to economic policy problems in the water area where a policy maker's welfare function, dependent upon the time paths of some specified state variables and instrument variables (constraints), is to be maximized. (Loeb-Rutgers)

ESTIMATION OF THE LINEAR EXPENDITURE SYSTEM,
Pennsylvania Univ., Philadelphia.
Robert A. Pollak, and Terence J. Wales.
Econometrica, Vol 37, No 4, p 611-628, Oct 1969. 4 tab, 3 append.

Descriptors: *Estimating, Expenditures, Demand, Economics, Statistical methods, Prices.
Identifiers: *Estimation, *Linear expenditure system, Maximum likelihood estimates, Consumption, Dynamic specification, Stochastic specification.

In this paper the authors estimate a complete system of demand equations making full use of the restrictions implied by economic theory. The theoretical model is based on the Klein-Rubin linear expenditure system which was first estimated by Stone. Primary emphasis is placed on maximum likelihood estimates obtained using annual time series observations of prices and per capita consumption for the U.S. economy in the period 1948-1965. The plan of the paper is as folows: Section 1 begins with a discussion of the problems involved in making systematic use of economic theory to estimate demand functions; this is followed by a brief description of the linear expenditure system and a discussion of the specification of its dynamic and stochastic structure. In section 2 three methods of estimating the linear expenditure system are described, including the maximum likelihood procedure which the authors believe to be most appropriate. The results are reported in Section 3 and conclusions in Section 4. This article would prove applicable to the water area when using econometric methods to estimate water demand equations.

ON OPTIMIZATION METHODS FO BRANCHING MULTISTAGE WATE RESOURCE SYSTEMS,
Montana State Univ., Bozeman.
Oscar R. Burt.
Water Resources Research, Vol 6, No 1, p 34 346, Feb 1970. 2 p, 8 ref.

Descriptors: *Optimization, *Linear programmi *Dynamic programming, *Constraints, *Wa resources.
Identifiers: *Nonlinear programming, Branching

Presentation of linear and nonlinear programi models and dynamic programing models for app cation to branching multistate systems was the p mary objective of the letter written in reference a recent paper by Meier and Beightler and su sequent discussions between Loucks and Meier a Beightler. The positions taken by the men me tioned ruled out the use of linear programing (a nonlinear programing) jointly with dynamic p graming within the same optimization scheme. was noted that the class of problems considered Meier and Beightler had the following properti (1) additivity in the criterion function, (2) linear in the constraints, and (3) essentially the so-call angular form in the constraint equations. It seem surprising that the Dantzig-Wolfe decompositi was not mentioned by Loucks or Meier a Beightler, since it was so applicable to proble with the three properties listed. The first two pr perties were ruled out by the author and the thi dynamic programing was considered. It was stat that recurrence relation of dynamic programi permits recursive optimization stage by stage, a there is nothing to prevent the use of linear or no linear programing in the optimization of each sta The virtues and advantages of the meth described were apparent to the author. OPTIMIZATION OF A REVERSE OSMOS SYSTEM USING NONLINEAR PR GRAMMING,
California Univ., Los Angeles. Graduate School Business Administration.
G. B. Hatfield, and Glenn W. Graves.
Desalination, Vol 7, No 2, p 147-177, Feb 1970. p, 2 fig, 6 tab, 18 ref, append.

scriptors: *Optimization, *Mathematical dels, *Desalination, Brackish water, *Reverse nosis, Computer programs, Costs.
ntifiers: *Nonlinear programming, *Coalinga ot Plant, Parameters.

mathematical model of a large tube reverse os- sis system for desalination of brackish water was veloped. The system was said to be similar to the ular assemblies of the Coalinga Pilot Plant scribed. Performance equations of a tubular as- bly developed by Rosenfeld and Lieb were sented. Then a mathematical model charac- izing a series of assemblies where the output m the first assembly is the input to the second, . was built. The parameters of pressure, flow e, salt concentration, tube length and diameter, d brine temperature characterizing the Coalinga nt were used with the performance equations to ermine the product flux and the product salt ncentration. The results were compared with ac- l operating curves from the Coalinga Plant to ermine the validity of the mathematical model d the performance equations. A nonlinear pro- mming problem was formulated with the objec- e of maximizing product flux and determining optimal arrangement of assemblies with respect fabrication temperature and was run on the IBM stem 360 Model 75 computer at UCLA. The ution of the problem pointed out that by using dern computing machines and optimization hniques substantial gains can be made in reduc- the size of reverse osmosis systems and thus ducing the cost of the water produced. scriptors: *Systems analysis, *Design, *Opera- ns research, *Engineering.
ntifiers: *Scientific method, Basic research, Ap- ed research, *Flow charts.

e thesis that the scientific method may generally applied to all types of problems, and that where method appears inapplicable it appears thus cause of application of the wrong pattern of the entific method's triad of patterns of problem ving, was presented. The three patterns within scientific method were entitled: (1) Basic search; (2) Applied Research; and (3) Systems proach and details of each were presented. A w chart sequence of steps involved in an efficient proach to basic research was shown. The key p shown is the process of induction in which a ory or principle is derived. A second flow chart monstrated the pattern of problem solving in ap- ed research. The most significant difference tween patterns of problem solving in basic and plied research was said to be in the types of as- mptions used. For the pattern characteristically ed in solving individual problems directly ap- cable to man's needs and desires, the systems ap- ach was described in a third flow chart. The ior differences between all three patterns of blem solving were summarized. (Kriss-Cornell)

MPUTER MODELING TECHNIQUES FOR VIRONMENTAL SYSTEMS,
lytechnic Inst. of Brooklyn, N.Y. Center for ban Environmental Studies.
ul R. DeCicco, and Richard Slutzah.
w York State Science and Technology Founda- n Report, Dec 1969. 172 p, 63 fig, 7 ref. Grant SSF (8)-1.

scriptors: *Computer programs, *Data cessing, *Input-output analysis, *Waste water atment, *Sewers, Design, Costs.

Identifiers: *Heuristic networks, Demographics, Topographics, Potential links, Digitizer, Nassau County.

The principal effort of the study was the development of a computerized heuristic technique for the layout of waste water collection systems. The general approach was predicted on the availability of a series of computer programs for testing by designing and costing the heuristic networks developed. A system was constructed for the consideration of demographic, topographic, and service characteristic information in the generation of 'Potential Links' for the area to be designed. The trial network was then developed by establishing each final link in accordance with priority ratings based on a number of weighted criteria. The system contained 32 routines including five major routines for defining the network, and ten special routines for determining the elevation at any point, the assignment of street code information, rating of how well each link satisfied the service requirement, and for performing a number of other functions which convert the trial network into a practical layout. The remaining routines were for sorting and ordering data, for printing tables and for performing special operations, such as reversing flow direction of a link, correcting service ratings, and printing error and other messages. A system was developed using an electronic x-y digitizer for input data. The possible use of mark-sense input techniques was also considered and described. A detailed design and cost estimating program and an evaluation of the heuristic network procedure based upon the output program was given. The street model used was in Nassau County. (Kriss-Cornell)

6B. Evaluation Process

SOCIAL AND ECONOMIC IMPACT OF SNOW SURVEY DATA,
Soil Conservation Service, Boise, Idaho.
Morlan W. Nelson.
Proceedings 37th Annual Meeting of Western Snow Conference, April 15-17, 1969, Salt Lake City, Utah; printed by Colorado State University, Fort Collins, p 83-87, 1969. 5 p, 2 fig, 5 ref.

Descriptors: *Snow surveys, *Social aspects, *Economics, *Cost-benefit analysis, Flood control, Water pollution control, Recreation, Reservoir operation, Water management (Applied), Planning, Economic impact, Social impact.
Identifiers: Snow survey data.

In general, there is a social and economic impact on many businesses or activities in the western United States from basic snow survey and water supply forecast data. However, in all cases, these data exert their influence through more efficient management of our basic resources of water and soil. Future generations will be more dependent upon the snow survey data than we are today, and upon the improvements that will be made through telemetry and new electronic equipment. A conservative estimate of the economic value of water supply forecasts to agriculture alone, excluding all Bureau of Reclamation projects, is responsible for a new increase in farm income of somewhere between $32,000,000 and $65,000,000 per year. The total economic and social impact is far greater than the primary farm income benefit. (Knapp-USGS)

CONFLICTS IN WATER USE AND REGIONAL PLANNING IMPLICATIONS,
Washington Univ., Seattle.
Ronald R. Boyce.
Edited by M. E. Marts, Regional Development and the Wabash Basin, p 145-156, University of Illinois Press, Urbana, 1964.

Descriptors: *Water utilization, Regions, Water resources development, Economics, Pacific Northwest U S.
Identifiers: *Conflicts, Shortages.

Water resource developments, comprising elements of private and public fiscal, economic, social, and political policy, are a fertile field for the generation of conflicts. This discussion provides examples of conflict situations and indicates some implications for planning. The discussion is focused on the Pacific Northwest where large and varied water resources support activities of vital importance in a limited regional economy: irrigation, hydropower production, fisheries, inland navigation, and recreation. Conflicts arise not so much because of shortages, but because of competing proposals for the use of important resources, or because of development proposals being opposed by those who see advantages in maintaining the status quo. (Loeb-Rutgers)

THE ECONOMICS OF PRODUCTION FROM NATURAL RESOURCES: NOTE,
Montana State Univ., Bozeman.
Ronald G. Cummings, and Oscar R. Burt.
American Economic Review, Vol 59, No 5, p 985-990, December 1969. 9 ref, 1 append.

Descriptors: *Natural resources, Economics, Resources, Investment, Capital, Mining, Profit.
Identifiers: *Production, Exhaustible resources, Replenishable resources.

The authors discuss a recent article by Vernon Smith which attempts to provide '...a unified theory of production from natural resources' encompassing production from exhaustible, as well as replenishable, resources. The authors question the general applicability of Smith's model with

reference to the optimum rate of production from exhaustible resources, and therefore his description of the optimum rate of investment in these industries. The purpose of this paper is first to discuss the limited nature of Smith's results concerning production and investment within the context of exhaustible resources, and secondly to present a model that retains Smith's emphasis on the interrelationship of capital and resource extraction, but conforms to the established theory concerning the economics of exhaustible resources. The model presented focuses on the individual firm and may prove to be applicable to the water resource area. (Loeb-Rutgers)

A COMPARISON OF BARTEN'S ESTIMATED DEMAND ELASTICITIES--WITH THOSE OBTAINED USING FRISCH'S METHOD,
California Univ., Los Angeles.
Robert Ayanian.
Econometrica, Vol 37, No 1, p 79-94, Jan 1969. 4 fig, 4 tab.

Descriptors: *Elasticity of demand, Demand, Marginal utility, Prices, Estimating, Statistical methods, Regression analysis.
Identifiers: *Frisch's method, Income elasticity, Direct elasticity, Cross elasticity, Want-independent goods.

From the knowledge of budget proportions, income elasticities, and income elasticity of the marginal utility of income, point estimates of all direct and cross demand elasticities with respect to price may be easily computed for want-independent goods. Estimates obtained in this manner are without standard errors. One method of ascertaining the reliability of such estimates is to compare them, under varying conditions, with corresponding estimates whose standard errors are known. Ragner Frisch has presented a method for computing all direct and cross demand elasticities under conditions of want-independence. Barten, using data for the Netherlands and the United Kingdom and assuming almost additive preferences, has obtained a complete set of direct and cross demand elasticities for a fourteen sector model. This paper gives the results of the application of Frisch's procedure to Barten's data to obtain a complete set of demand elasticities which are then compared to those presented by Barten. The author concludes that Frisch's method for the determination of all direct and cross demand elasticities should be of great value in those areas where little price data is available. This method, although complex, would be applicable in estimating water demand functions.

COMPETITION AND THE REGULATORY PROCESS,
James W. Karber.
The Quarterly Review of Economics and Business, Vol 9, No 3, p 57-64, Autumn 1969. 8 p.

Descriptors: *Public utilities, *Regulation, *Competition, Investment, Technology, Gross National Product, Economics, Costs, Prices, Transportation, Interest rate, Financing, Profits, Productivity, Efficiencies.
Identifiers: *Rate of return, *Promotion, Diversification.

In most regulated industries the issues of competition and promotional practices are being raised with increasing frequency. There are efforts to make greater competition a supplement to regulation. It is often pointed out that competition brings increased productivity and better resource allocation. The article shows, however, that the results of regulation in the U.S. have been good. Public utilities, which would include water utilities, are in the midst of a period of great technological change which presents problems for regulators. It is necessary that competitive forces be properly directed if they are to be useful. Competition and regulation are terms having little meaning in the abstract and must be applied to real regulatory situations if their values are to be tested. The approach to be used should be guided by society's individual and social goals. The importance of the regulatory process in many water resource projects make this a valuable article for the water resource planner. (Murphy-Rutgers)

NOTE ON EVALUATIONS OF R/S FOR FRACTIONAL NOISES AND GEOPHYSICAL RECORDS,
IBM Watson Research Center, Yorktown Heights, N.Y.
Murad Taqqu.
Water Resources Research, Vol 6, No 1, p 349-350, Feb 1970. 2 p, 2 fig, 4 ref.

Descriptors: *Computer programs, *Statistics, Hydrologic aspects, Mathematical models.
Identifiers: Mistake, Fractional noises, Geophysical records.

A mistake in the computer program evaluating the statistic R/S affecting the figures in the papers of Mandelbrot and Wallis (Water Resources Research Vol 5, No 1:228-267, 1969; Vol 5, No 2:321-340, 1969; Vol 5, No. 4:917-920, 1969; Vol 5, No. 5:967-968, 1969) was found. Once the mistake was corrected, the self-similar model of hydrologic time series turned out better than what was thought from the above mentioned papers. The mistake had an important effect only when the lag s was small. Corrected graphs were shown of R/S for a sample of fractional Gaussian noise and a hydrologic record of annual tree ring indices for a bristlecone pine from White Mountain, California. The mistake was due to a discrepancy between the mathematical definitions of the sequential range R and the actual formula used in the program to compute this R. In copies of the R/S program distributed by SHARE the above mentioned error has been corrected. (Kriss-Cornell)

PROBABILISTIC SELECTION OF PROJECT DESIGN FLOODS,
Tennessee Valley Authority, Knoxville.
Bevan W. Brown, Jr.
Paper, American Society of Civil Engineers, National Water Resources Engineering Meeting, Memphis, Tenn, Jan 1970. 26 p, 6 fig, 4 tab.

Descriptors: *Probability, *Design flood, *Decision making, Spillway design flood, Design criteria, Dams, Flood forecasting, Maximum probable flood, Spillways, Hydrology, Floods, Flood damage, Risks, Statistical methods, Statistical models, *Mathematical models, Costs, *Numerical analysis, Equations, Economic justification, Design storm.
Identifiers: Spillway capacity, Design assumptions, Flood probability, Flood hydrology, Flood estimate, Selection.

Using a damsite on the lower Hiwassee River in the Tennessee River Valley as an example, the application of probabilistic techniques and decision theory in selection of project design floods is illustrated. Selection of the design flood for a structure can be divided into 2 steps: (1) forecasting probability of occurrence and magnitude of potential floods by applying probability theory, hydrometeorolog and hydrology; and (2) selecting a particular o timum design flood within the potential range applying statistical decision theory. Current pra tice in selecting design floods does not utilize fu statistical decision theory and is essentially arbitr ry. Bayesian statistical decision theory provides mathematical model for making engineering de sions in the face of uncertainty. The model can used to find the optimum decision and to evalua the price or cost of reducing the degree of risk some lower level. Information from probabilisti economic models should not be used as the so basis for selecting design floods, but such mode do provide the framework for improving curre procedures. (USBR)

ECONOMIC RESPONSIBILITY FOR THE BY PRODUCTS OF PRODUCTION,
Resources for the Future, Inc., Washington, D.C.
Allen V. Kneese.
Annals of the American Academy of Political an Social Science, Vol. 389, May 1970, p 56-62. 1 fi 1 table, 3 ref.

Descriptors: *Economics, *Resource allocatio *Resources, Resource development, Institutions.
Identifiers: Environmental quality, System of in centives, Common property resources, Economi system.

The central concepts governing resources-alloca tion in the United States have historically bee private property, freedom of exchange and com petition. The social engine built on these concept has produced rapid exploitation of resources an rapidly rising per capita income in the Unite States. In recent years, however, resources whic cannot readily be reduced to private ownershi have become rapidly more important, and they ar being overused and misused. The pollution of such 'common property' resources as water and the ai mantle is inherent in an economic system such a ours, once a certain stage of economic develop ment is reached. To deal successfully and effi ciently with these problems will require designin new governmental institutions, and especially, al tering our system of incentives in such a way tha the value of common property resources i reflected in market-type decisions. OUTDOOR RECREATION ECONOMICS,
Resources for the Future, Inc., Washington, D.C. and George Washington Univ., Washington, D.C.
John V. Krutilla, and Jack L. Knetsch.
Annals of the American Academy of Political and Social Science, Vol. 389, May 1970, p 63-70. 3 ref.

Descriptors: *Recreation, *Economics, Resource allocation, Economic efficiency, Distribution, Resource mix.
Identifiers: *Ourdoor recreation.

Outdoor recreation economics is an area similar to numerous other study areas in the general field of economics. Economists working in this area are concerned with the efficiency of the allocation of resources between outdoor recreation facilities and programs, on the one hand, and goods and services, generally, on the other--and, within the area of outdoor recreation, with the efficiency of the resultant mix of facilities and programs. Concomitantly, they become involved with the question of 'distributive justice', namely, the distribution of recreational opportunities among the various segments of the population. In this paper, we distinguish roughly between resource-oriented outdoor recreation and

ulation- or market-oriented outdoor recreation. he former, we find a predominantly middle-or er-middle-income clientele and an economic ironment which favors application of the lytical, management, and policy tools of 'effi- ncy economics'. In the latter, we find concentra- ns of the impoverished among ghetto residents, the question of equitable distribution of recrea- al facilities and programs becomes equally as ortant as the efficiency with which they are pro- d. E TECHNOLOGICAL IMPERATIVE--SO- L IMPLICATIONS OF PROFESSIONAL CHNOLOGY,
Kinsey and Co., Inc., Washington, D.C.
id B. Hertz.
nals of the American Academy of Political and ial Science, Vol 389, May 1970. p 95-106, 35

criptors: *Technology, *Social aspects, *En- nment, Management, Social values.
Identifiers: *Technological imperative, Environmental problems, Professional technology.

Engineers and technologists have always considered themselves to be protagonists and leaders in man's struggle against nature. Each successful engineering project has been conceived as one more victory in the campaign to master the natural environment. By virtue of their successes, feeling has grown that there were no results that could not be achieved. But should man consider nature his enemy. If so, how can he win. Each time that technology has changed nature, there have been negative effects which had not been foreseen. These negative spillovers have rapidly multiplied the total environmental problem of the planet. It has now become clear that increasing population and changes in the rate of energy consumption are pushing toward a destructive total thermodynamic balance. If this change is not to be catastrophic, man will have to find a way to achieve an energy equilibrium. The technologist and engineer must be at the forefront of this search. For some reasonable expectation of success, a new approach will have to become part of technological problem-solving. This approach must involve technological assessments and evaluations that include much broader constraints than have been imposed in the past. The technological imperative calls for the reconstruction of engineering and technological curricula to include truly effective evaluation and assessment of proposed solutions to technological problems. (Davis-Chicago)
W70-07991

THE SOCIAL AND PERSONALITY CORRELATES OF OUTDOOR RECREATION,
Virginia Univ., Charlottesville.
Abbott L. Ferriss.
Annals of the American Academy of Political and Social Science, Vol 389, May 1970. p 46-55, 4 tables, 20 ref.

Descriptors: *Recreation, *Social aspects, *Psychological effects, Social values, Attitudes, Social needs.
Identifiers: Sociocultural system.

The sociocultural system, through rewards such as status, sociability of group activities, value orientations, attitudes, and the like, evokes outdoor recreation preferences, as is revealed by actual participation rates. Physical activity associated with many forms of outdoor recreation leads to more vigorous health. Physical activity groups, such as athletes engaged in a particular sport, exhibit personality traits that are different from those of nonathletes. However, it has not been demonstrated that personality traits are altered through participating in physical exercise or sport. Persons with different socioeconomic characteristics exhibit different recreation participation rates. From 1960 to 1965, these rates have been changing. Major increases in passive recreational activities have occurred, but participation rates in activities that require large allocations of natural resources have increased very little active forms of recreation, chiefly characterizing youth, have increased notably, while backwoods activities have increased only slightly. (Davis-Chicago)
W70-07992

ANTICIPATIONS OF CHANGE: A SOCIO-ECONOMIC DESCRIPTION OF A KENTUCKY COUNTY BEFORE RESERVOIR CONSTRUCTION,
Kentucky Water Resources Inst., Lexington.
Charles Robert Smith.
Available from the Clearinghouse as PB-192 636, $3.00 in paper copy, $0.65 in microfiche. Research Report No. 28, 1970. 161 p, 7 tab, 53 ref. OWRR Project A-022-KY (8).

Descriptors: *Planning, *Attitudes, Human population, *Social impact, *Social change, Social values, Kentucky, Reservoirs, Social adjustment.

In the past the construction of large reservoirs in the United States has been evaluated largely in terms of the economic benefit they bring to the area where they are constructed and to the nation. Where human populations are involved, however, a host of social changes occur, many of which fundamentally alter the way of life of a people. The report is part of a larger study which aims at analyzing the social costs and benefits of reservoir construction. This document concentrates on the social and economic description of a rural county before reservoir construction by the United States Corps of Engineers. The major findings in this study point to the preconstruction impact that the reservoir has on people.

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

THE FIRM'S LONG-RUN AVERAGE COST CURVE,
National Chengchi Univ., Taipei (Taiwan).
Chen Fu Chang.
Quarterly Review of Economics and Business, Vol 9, No 4, p 80-84, Winter 1969. 5 p.

Descriptors: *Costs, *Economics, Economic efficiency, Optimization, Return to scale, Profits, Costs analysis, Technology, Average costs.
Identifiers: *Long-run costs, *Short-run costs, *Least cost point, Plant size, Cost curves.

The normal case of the firm's long-run average cost (LAC) curve has been known as an 'envelope' curve which is tangent to a series of the U-shaped short-run average cost (SAC) curves and which itself takes a flatter U-shape. The author finds fault with the usually assumed shape of the SAC curves which dictates that output at less than the least-cost point of the LAC curve be best produced with a larger plant operating at less than its optimum whereas the output at more than the least-cost point of the LAC curve be best produced with a smaller plant operating at more than its optimum. The author shows that with few exceptions there seems to be no reason for the least-cost of the SAC curves to be standing off the LAC curve, and the normal case of the LAC curve should consist of a series of the least-cost points of U shaped SAC curves. The theoretical implications of this article for scale of plant in water industries should make it of interest to the water researcher. (Murphy-Rutgers)

WATER RESOURCES OF NEW MEXICO: OCCURRENCE, DEVELOPMENT, AND USE,
New Mexico State Engineer Office, and New Mexico Interstate Stream Commission.

Santa Fe, State Planning Office, 1967. 321 p, 46 fig, 4 pl, 63 tab, 229 ref.

Descriptors: *Water resources development, *Water supply, *Planning, *New Mexico, *Hydrology, Colorado River basin, Rio Grande,

Arid lands, Geology, Semiarid climates, River basins, River basin development, Surface waters, Groundwater, Groundwater basins, Water utilization, Water resources, Natural resources, Consumptive use.
Identifiers: Arkansas River basin, Pecos River basin, San Juan River basin.

This report on the water resources of New Mexico was prepared as a contribution to the New Mexico Resources Development Plan. An introductory summary outlines statewide water conditions. Otherwise, the data presented in the report are grouped according to the nine major surface-water drainage areas of the state. These drainages are: Arkansas River basin, Southern High Plains, Pecos River basin, Central closed basins, Rio Grande basin, Western closed basins, San Juan River basin, Lower Colorado River basin, and Southwestern closed basins. Each basin report is divided into two major sections: one part deals with geography, geology, and hydrology; the other concerns the history of settlement, development, and water use. The report is amply supplied with explanatory figures and tables. (Carr - Arizona)

BEMIS V BEMIS (OWNERSHIP OF LAKE BEDS).

11 A2d 218-219 (Vt 1940).

Descriptors: *Vermont, *Riparian rights, *Ownership of beds, *Boundaries (Property), Non-navigable waters, Ponds, Lakes, Land tenure, Legal aspects, Lake shores, Banks, Watercourses (Legal), Boundary disputes, Lake beds, Riparian land, Riparian waters, Judicial decisions, Relative rights.
Identifiers: *Public water.

Plaintiff sued for trespass upon a lake. Defendant had title to most of the land surrounding the lake and claimed ownership of the land under it. A small parcel of defendant's land was previously owned by a third party who gave plaintiff a quit-claim deed to the lake and the land under it. Plaintiff claimed title to the center of the lake under the rule that when conveyed land is bounded by a non-navigable stream or pond, the grantee takes to the center if his grantor owned that far. Defendant claimed that plaintiff's grantor's land ran only to the banks of the lake, and was not bounded by the lake. The court held that it is a fact question whether the grantor's land bounded on the lake. Where the description of the property conveyed runs the boundry along dry land such as a bank, shore or margin of a private pond or lake, land under water is excluded from the conveyance. In the instant case, the court found that plaintiff's grantor's land ran only to the bank of the lake. Consequently, since plaintiff's grantor had no title to the bed of the lake, plaintiff acquired none. (Leesfield-Florida)
W70-07858

LOWE V GREEN MOUNTAIN POWER CORP (DISPUTE BETWEEN ADJACENT RIPARIAN OWNERS AS TO WATER RIGHTS IN POND).

11 A2d 219-222 (Vt 1940).

Descriptors: *Vermont, *Boundary disputes, *Prescriptive rights, *Boundaries (Property), Judicial decisions, Legal aspects, Relative rights, Lakes, Ponds, Land tenure, Lake shores, Boating, Dams, Bulkheads, Bulkhead gates, Mills, Saw mills, Fishing, Water rights, Access routes, Hydroelectric plants, Real property.

Both plaintiff and defendant, owners of adjacent lots on a pond, claimed water rights to three-fifths of a dam and bulkhead on the pond, and to a part of the pond itself. Plaintiff sought to enjoin the occupation and use of such rights by the defenant power corporation. Both claimed the pond rights by virtue of the boundaries set forth in their chains of title, and plaintiff also argued that the boundary line had been established by acquiescence. Plaintiff and her predecessors had used the disputed portion of the pond for boating and fishing, for the washing of clothes, and for the operation of a saw mill. In deciding for the defendant, the appellate court held that the property conveyance upon which plaintiff relied was insufficient to establish her claim to the water rights. Moreover, the facts upon which plaintiff relied to show acquiescence were not so compelling as to require a reversal of the decision by the chancellor in the lower court. (Marsee-Florida)
W70-07862

WALDEN V PINES LAKE LAND (RIGHT OF USE BY CREATORS OF ARTIFICIAL LAKE).
126 N J Esq 249, 8 A2d 581-584 (1939).

Descriptors: *New Jersey, *Easements, *Usufructuary right, *Artificial watercourses, Lake beds, Ownership of beds, Land tenure, Contracts, Claims (Contracts), Benefits, Costs, Judicial decisions, Watercourses (Legal), Buoys, Roads, Boating, Remedies, Legal aspects, Overflow, Dams, Fishing, Water utilization, Damages, Streams.

Plaintiff and defendant owned adjoining tracts of land across which flowed a brook. Pursuant to a contract between them, plaintiff and defendant dammed the brook and created a lake upon both tracts. Defendant then proceeded to establish a dividing line of buoys across the lake, prohibiting the use of the lake as an entity. Plaintiff brought action to reform the contract, to restrain interference with his rights of use in the lake, to restrain maintenance of the buoys, and to recover damages. The court held that plaintiff, without the showing of an easement, had no right to use those portions of the lake above defendant's land. However, pursuant to the terms of their contract, each party had obtained such an easement to use the waters above the other's land. Defendants were estopped to deny plaintiff use of the entire lake. A landowner who permits flowage over part of his land to form a lake, and who pays a portion of the costs for such, obtains an easement or license to use the entire lake. (Marsee-Florida)
W70-07866

SMELCER V RIPPETOE (PRESCRIPTIVE RIGHT TO FLOOD LAND).
147 SW2d 109-115 (Tenn Ct App 1940).

Descriptors: *Tennessee, *Easements, *Prescriptive rights, *Dams, Legal aspects, Boundaries (Property), Proprietary power, Relative rights, Flooding, Repulsion (Legal aspects), Riparian land, Riparian rights, Usufructuary right, Watercourses (Legal), Concrete dams, Mill dams, Backwater, Damsites, Overflow, Floodwater, Water injury.
Identifiers: *Injunction (Prohibitory).

Defendant purchased a dam and adjoining land. The dam had existed in one form or another for over 100 years, during which time the stream that it impounded had continuously flooded plaintiffs' lowlands at high tides. Six years prior to defendant's acquisition of the dam, a presumably criminal dynamite explosion partially destroyed it. The release of impounded waters caused by such partial destruction eliminated the flooding of plaintiffs' land. Defendant's predecessor in title had been financially unable to repair the dam after the explosion; consequently, it had remained out of use until defendant acquired title. Plaintiffs sued to enjoin defendant's repair of the dam, contending that previous owners had not legally owned the dam and, in any event, defendant's immediate predecessor in title had abandoned it in that it had been out of use for 6 years. The court held that the open and continued existence and maintenance of the dam for more than the prescriptive period of 20 years created a prescriptive right in the dam owner to cause flooding of plaintiffs' lands. Such right attached to the dam in serviceable condition, not merely to the damaged remains. Moreover, the financial inability of defendant's vendor to repair the dam indicated no intent to abandon it. (Clark-Florida)

MCDONALD V SARGENT (DESTRUCTION O PRESCRIPTIVE EASEMENT BY NONUSER).

13 NW2d 843-844 (Mich 1944).

Descriptors: *Michigan, *Easements, *Prescriptiv rights, *Flood damage, Land tenure, Legal aspect Dams, Land use, Overflow, Grants, Floodin Streams, Judicial decisions, Pastures, Competir uses, Wetlands, Relative rights.
Identifiers: *Injunction (Prohibitory).

A creek crossed plaintiffs' farm and ran below defendants' land where a dam, owned by defe dants, was located. Between 1901 and 1905 th dam was washed away, and it was not rebuilt un 1930. Plaintiffs claimed that the rebuilt dam r tarded the flowage of water and caused saturatio of their low land, and sought to enjoin suc floodage. Defendants answered that the rebui dam caused no greater floodage than the origin dam and that by old grants and prescriptive righ plaintiffs could not recover. Plaintiffs denied th claimed grants and averred that the prescriptiv rights were lost by defendants' nonuser for 25 yea after the old dam was destroyed and before the ne dam was erected. The court, in granting plaintiff injunction, held that nonuse of the dam by defe dants for a period of 25 years resulted in a loss the original easement. The court drew a distinctio between easements acquired by grant, which cou not be extinguished by nonuser, and easemen acquired by prescription. A prescriptive easeme is an unopposed continuous trespass for 15 yea which can be lost by nonuser for a period equal that required for its creation. (Leesfield-Florida)

GREAT LAKES INSTITUTIONS, A SURVEY O INSTITUTIONS CONCERNED WITH TH WATER AND RELATED RESOURCES IN TH GREAT LAKES BASIN.
Committee on Multiple Use of the Coastal Zon Washington, D.C.

Great Lakes Basin Commission, June 1969. 58 p, append.

Descriptors: *Great Lakes, *Great Lakes Regio *Institutions, Federal government, Communic tion, Planning, Methodology, Coordination, I stitutional constraints, Organizations, Gover ments, Administration.

The purpose of this document is to prepare a co temporary survey of institutions having respon bility for or interest in the Great Lakes which c be used as a tool by these institutions to aid reducing confusion and improving communicatio and coordination. This institutional confusion due to the dramatic increase in recent years of i stitutions concerned with the Great Lakes. Mi sions sometimes are uncoordinated and ove lapping and cohesiveness and unity of purpo among these institutions require strengthenin

sumes of the various institutions concerned with
Great Lakes are presented in five major
oupings: international (United States and
nada) institutions, Canadian institutions, federal
nited States) institutions, states and universities,
d private institutions. (Davis-Chicago)

n-environment relationships, Politico-ethical
ology, Public authority, Public responsibility.

thority and responsibility for ecologically sound
icies for man-environment relationships are
fused by the lag between the changing circum-
nces of man-on-earth and his assumptions,
avior patterns, and institutions. In the United
tes, many attitudes which were hitherto feasible
e now become harmful. Sanctification of politi-
forms and unrealistic appraisals of the ten-
cies of technological society severely handicap
sent efforts to cope with environmental
blems. If society is to deal effectively with these
blems, political and administrative leadership
be required to help the people to understand
necessity for certain changes in their expecta-
s, laws, and public institutions. A new, ecologi-
y valid politico-ethical ideology is needed to
timize the tasks of public authority and respon-
lity that an effective effort to cope with man's
ironmental problems would require. A dual cri-
of attitudinal and institutional inadequacy must
surmounted if the resulting crisis of the environ-
nt is to be overcome. (Davis-Chicago)

**RRIS V TOWNSEND (SUIT TO ACQUIRE
E OF ARTIFICIAL LAKE BY NON-RIPARI-
OWNER).**

SE2d 819-824 (SC 1970).

scriptors: *South Carolina, *Easements,
kes, *Artificial watercourses, Developed
ers, Dams, Watercourses (Legal), Land tenure,
ative rights, Prescriptive rights, Water rights,
arian rights, Judicial decisions, Legal aspects,
oding, Surface waters, Recreation, Impound-
nts, Discharge (Water), Impounded waters,
inage systems, Riparian land, Remedies, Real
perty.

fendant constructed a dam on his property and
ated an artificial lake. Plaintiffs' predecessors in
granted an easement to defendant to flood a
tion of their land in creating the lake, reserving
a right to fill in that portion if they so desired.
fendant subsequently prohibited use of the lake
plaintiffs or by residents of plaintiffs' trailer park
ated on land adjacent to the lake. In this action
ntiffs sought authorization for use of the lake.
court, in holding for defendant, ruled that a
riparian owner seeking use of a lake must base
claim on a right acquired by prescription or
nt. The easement created only a dominant and a
vient estate and granted no right to use the lake.
sole, express reservation of the right to fill the
ndated portion tended to negate the existence of
er reserved or implied rights in plaintiffs. The court did grant a request by defendants for an injunction to prohibit plaintiffs from collecting surface water in an artificial drainage system and casting them in concentrated from upon the property or the lake of defendant. (Hubener-Florida)

SLAYTON GUN CLUB V TOWN OF SHETEK (LAKES AND STREAMS INCLUDED IN TERM LAND).
176 NW 2d 544-548 (Minn 1970).

Descriptors: *Minnesota, *Ownership of beds, *Access routes, *Land classification, Lake beds, Land tenure, Beds under water, Local governments, Legislation, Islands, Arable land, Non-navigable waters, Real property, Right-of-way, Administrative agencies, State governments, Adjudication procedure, Judicial decisions.

Plaintiff owned 45 acres of property which was inacessible except over lands owned by others. Pursuant to a state statute, plaintiff applied to the town board to establish a cartway between his land and a public road. The town board denied plaintiff's petition stating he did not own at least 5 acres of land as required by the statute. The court found that while plaintiff did own an area of 45 acres, less than 5 acres were above water. The court held for plaintiff, however, stating that the word 'land' in the statute included submerged land. The court stated that the word 'land', if unmodified by a restrictive word such as 'tillable', would include soil, lakes and streams. (Hubener-Florida)
W70-08006

CASTAWAYS MOTEL V SCHUYLER (STATE'S CONDITIONAL GRANT OF A RIVERBED).
25 NY2d 692, 306 NYS2d 692 (1969).

Descriptors: *New York, *Ownership of beds, *Public lands, *Administrative agencies, River beds, State governments, Navigable rivers, Flooding, Flood damage, Landfills, Navigable waters, Water rights, Water law, Management, State jurisdiction, Remedies, Legal aspects, Judicial decisions, Rivers, Land, Land tenure, Regulation, Damages, Real property.
Identifiers: *Grants (Land).

Plaintiff private landowner received from defendant Commissioner of General Services a grant of state lands beneath the Niagara River. The grant was conditional in that it contained a covenant to forego future damages. Prior to plaintiff's knowledge of the conditional nature of the grant, he expended a considerable sum in filling the land. Thereafter, plaintiff sought delivery of the lands without the condition attached to the grant. Defendant contended such condition was necessary in order to protect the state as intrusion of landfills in rivers would increase the possibility of flooding and damage in the course of public power development. The court held defendant, in having authorized a grant of state lands, could impose only reasonable conditions upon the recipient landowner, including a covenant to forego future damages. (Finman-Florida)
W70-08007

CZARNIK V SAMPSON ENTERPRISES, INC (LEASING OF PROPERTY ACQUIRED BY EMINENT DOMAIN).

175 NW2d 487-491 (Wis 1970).

Descriptors: *Wisconsin, *Condemnation, *Drainage systems, *Leases, Sewage districts, Local government, Easements, Right-of-way, Legal aspects, Land tenure, Drainage programs, Judicial decisions, Ditches, Water management (Applied), Eminent domain, Administration, Land use.

Defendant corporation acquired a lease to a certain piece of property from a county sewage district. The land originally had been condemned by the federal government in 1944 for a perpetual easemant and right-of-way for a drainage ditch, but these rights were acquired by the sewage district. Plaintiffs, whose predecessors in title owned the land in 1944, sought to enjoin use of the land by defendant, arguing that the lease increased the burden of the easement on their land. The court stated that an easement should be construed to leave the owner with the greatest possible estate since easement rights are acquired by compulsion. The estate acquired should be no greater than what is reasonably necessary to carry out the purpose of the condemnation proceeding. In holding for defendants and denying the injunction, the court ruled that the terms of the lease were consistent with the interest acquired by condemnation in 1944, and the granting of the lease did not constitute an abandonment of the rights and interests of the district in the property. (Hubener-Florida)

ARKANSAS LAND AND CATTLE CO V ANDERSON-TULLY CO (BOUNDARY DISPUTE CAUSED BY ACCRETION).
452 SW2d 632-641 (Ark 1970).

Descriptors: *Arkansas, *Accretion (Legal aspects), *Avulsion, *Boundary disputes, Land tenure, Boundaries (Property), Bank erosion, Water law, Mississippi River, Islands, Navigable rivers, Real property, Channel erosion, Jurisdiction, Geomorphology, Sedimentation, Sand bars, Currents (Water), Thalweg.

Plaintiff Arkansas landowner brought suit to quiet title to land located in the Mississippi River between the states of Arkansas and Mississippi. Plaintiff claimed the land was separated from the Arkansas mainland by avulsion and consequently title to the land remained in it. Defendant Mississippi landowner claimed the tract as an accretion to its lands in Mississippi. The lower court decided that the tract had been formed by erosion and accretion to defendant's land and dismissed the suit for lack of jurisdiction. The Arkansas supreme court adopted the factual findings that the area in question had been within the boundaries of sections of land owned by plaintiff according to a federal survey of 1825 and that the land in dispute was not formed until 1862-1874. The supreme court also acknowledged that the sailing channel of the river at the time of the suit ran between the tract in question and the Arkansas shore. The supreme court reversed, however, and held that the presumption that land is formed in a river by accretion rather than avulsion operates only where there is no countervailing evidence. The burden was on defendant to prove that the land in question was formed by accretion. Since defendant had failed to meet the burden of proof of accretion, the Arkansas court retained jurisdiction over the land. (Hubener-Florida)

UNITED STATES V SEVERSON (OWNERSHIP OF ISLANDS IN NAVIGABLE WATERS).
309 F Supp 915-917 (W D Wisc 1970).

Descriptors: *Wisconsin, *Boundaries (Property), *Islands, *Boundary disputes, Deposition (Sediments), Beds under water, Federal jurisdiction, Patents, River flow, Channel morphology, Shores, Navigable waters, Ownership of beds, Judicial decisions, Legal aspects, Accretion (Legal aspects).

The United States brought action to clear title to islands located between shorelands owned by defendants and the thread of the Mississippi River. Defendants contended that ownership of the shorelands and the operation of Wisconsin law gave them title to all lands here involved. The court held that all islands in existence in navigable waters at the time a state is admitted to the Union remain under federal ownership until specifically conveyed away. These lands were not so conveyed, and Wisconsin, therefore, had no title to convey to defendants by operation of law or otherwise. (Price-Florida)

UNITED STATES V RAY (FEDERAL JURISDICTION OVER AND RIGHT TO SUBMERGED CORAL REEFS).
423 F2d 16-23 (5th Cir 1970).

Descriptors: *Federal jurisdiction, *Continental shelf, *Reefs, *Beds, Coastal structures, Florida, Caissons, Coasts, Coral, Construction, Federal government, Remedies, Legal aspects, Water rights, Exploitation, Exploration, Natural resources, Public benefits, Judicial decisions, International law, Legislation, Oceans, Regulation.
Identifiers: *Injunction (Permanent), *Outer Continental Shelf Lands Act.

Defendants were rival private claimants who desired to build an island nation upon two submerged coral reefs located four and one-half miles from the coastline of Southeastern Florida. The reefs were part of a seabed of the outer continental shelf. Defendants had actually begun construction of caissons on the reefs at the time the United States, as plaintiff, brought proceedings to permanently enjoin their activities. The Court of Appeals based their granting of the injunction upon several grounds. First, defendants' activities were unlawful without the issuance of a permit from the Secretary of the Army under authority of the Outer Continental Shelf Lands Act. Secondly, plaintiff had the sovereign and exclusive right to the jurisdiction and control of these reefs for purposes of exploitation and exploration. Specifically, these reefs were within the area designated as the continental shelf by both the Outer Continental Shelf Lands Act and the Geneva Convention on the Continental Shelf. The Geneva Convention confirmed the exclusiveness of plaintiff's rights, particularly with reference to the natural resources of the continental shelf. Finally, plaintiff had a vital interest in preserving these reefs for public use and enjoyment. (Finman-Florida)
W70-08012

CHOCTAW NATION V OKLAHOMA (OWNERSHIP OF RIVER BEDS).

90 S Ct 1328-1346 (1970).

Descriptors: *United States, *Oklahoma, *River beds, *Ownership of beds, Submerged lands, Riparian rights, Federal government, Navigable rivers, Relative rights, Remedies, Legal aspects, Judicial decisions, Treaties, Water law, Leases, Patents, Royalties, Indian reservations, Federal reservations, State governments, Federal jurisdiction.

Plaintiff Indian nations brought action against defendant state to recover royalties which stemmed from mineral leases to land underlying navigable portions of the Arkansas River which ran through their reservations. Defendant claimed title to the land in question had passed to it through the granting of statehood, while plaintiffs alleged title had previously passed to them through treaties and patents. The major question involved whether the vast tracts of land granted the Indians included the beds of the navigable portions of the river which ran through the tracts. If this were to be answered in the negative, then the title would have been reserved in the United States and would have passed to Oklahoma at statehood. The United States Supreme Court reasoned that since the beds were not specifically excluded in the grants to the Indians and since questions regarding treaties with Indian nations are to be resolved in favor of the Indians, the title to the beds had passed in fee simple to plaintiffs. (Barker-Florida)
W70-08014

HARDIN V JACKSON YACHT CLUB, INC (LIABILITY FOR BOAT COLLISION WITH UNLIGHTED CONCRETE WALL).
232 So 2d 721-729 (Miss 1970).

Descriptors: *Mississippi, *Accidents, *Reservoirs, *Retaining walls, Riprap, Barriers, Concrete construction, Boats, Concrete structures, Dams, Bank protection, Bank stabilization, Erosion control, Shore protection, Navigation, Warning systems, Lakes, Safety, Safety factors, Remedies, Hazards, Legal aspects, Judicial decisions.
Identifiers: *Negligence.

Plaintiff brought action against the owner of a motorboat and a yacht club to recover for the wrongful death of an occupant of the motorboat during a boating excursion upon a reservoir. The plaintiff alleged that the defendant boatowner had been negligent in operating the boat and that the defendant yacht club had been negligent in constructing the unlighted concrete retaining wall which extended out into the lake and which the boat struck at night. The lower court found the boat operator negligent but exonerated the yacht club of negligence. Plaintiff appealed contending he was entitled to a directed verdict against the yacht club. The appellate court held that the lower court had established three determinative questions: (1) whether the club was negligent in constructing the unlighted wall; (2) whether such negligence, if found, was a proximate cause of the accident; and (3) whether the boat struck the wall or a rocky section of the shoreline known as a riprap. The court held these were questions for the jury and affirmed the verdict for defendant. (Hubener-Florida)
W70-08015

PADDOCK V TOWN OF DURHAM (DAMAGES FROM TEMPORARY EASEMENT FOR SEWER CONSTRUCTION).

261 A2d 438-442 (N H 1970).

Descriptors: *New Hampshire, *Easements, *Eminent domain, *Sewers, Structures, Cities, Manholes, Sewage disposal, Damages, Costs, Condemnation, Legal aspects, Leaching, Artesian wells, Septic tanks, Domestic wastes, Judicial decisions, Riparian land, Remedies.
Identifiers: Temporary easements.

Plaintiff riparian landowner brought suit for damages to his property incurred when defendant municipality constructed a sewer line on it. Both a temporary easement for the purpose of construction and a permanent easement for continued operation had been taken by means of defendant's power of eminent domain. Plaintiff alleged that the easement prevented the construction of a boathouse on the shore of his porperty. Following a judgment for plaintiff, defendant appealed on grounds of improper methods of assessments of damages through the use of illegal evidence and instructions. The Supreme Court of New Hampshire held that the measure of damages for a temporary easement differs from standards applied in a permanent taking. The court stated that the measure was that of the value of the use deprived of during the temporary easement and the cost necessary to restore the property to its original value. The judgment in favor of the plaintiff was affirmed. (Barker-Florida)
W70-08016

PARR V CITY OF ERLANGER (ASSESSMENTS FOR MUNICIPAL IMPROVEMENT BENEFITS).

438 SW2d 785-788 (Ky 1969).

Descriptors: *Kentucky, *Tangible benefits, *Cities, *Assessments, Judicial decisions, Water supply, Construction, Rates, Legal aspects, Sewers, Pipes, Taxes, Value, Evaluation, Eminent domain, Condemnation, Roads, Right-of-way, Plumbing, Water costs, Water rates, Project planning, Public health, Water transfer, Direct benefits.

Plaintiff municipality sought to collect assessments against defendant's property for street, water and sewer improvements. Defendant resisted payment alleging that the municipality knew the property sought to be assessed was included in a planned right-of-way for an interstate highway and thus was in no way benefited by the improvements. The court held that actual benefit to the property by the improvements was inconsequential to defendant because upon sale of the condemned land, the amount received in payment was the value of the land as appreciated by the water, street and sewer improvements. The property was benefited in this manner and thus subject to assessment based on the amount of front-footage improved property. The court held further that each foot of property benefited must be proportionately assessed, not solely that portion of the property to which the improvements extended. (Barnett-Florida)
W70-08017

MARIBU V NOHOWEC (MUNICIPALITIES ADHERENCE TO STATE WATER SUPPLY STATUTES).
161 Misc 944, 293 NYS 457-464 (Sp Ct 1937).

Descriptors: *Contract administration, *New York, *Water supply, *Municipal water, Water consumption, Water works, Water control, Utilities, Bids, Contracts, Costs, Local governments, State governments, Legislation, State jurisdiction, Legal aspects, Administrative agencies, Judicial decisions, Cities.

Defendants, the mayor and trustees of a village, authorized a contract for the construction of a well and pumping equipment for the village. Plaintiff, a taxpayer brought this action to have the contract award declared null and void. Plaintiff contended that defendant had acted in violation of state law by failing to publicly solicit bids for the contract. In holding for plaintiff the court stated that a municipality has full power to establish or extend a waterworks system. However, the question of water supply is one of state-wide concern over which the legislature has full control. As representatives of a political subdivision of the state, defendants were required to adhere to a state statute requiring public solicitation of bids. Although the court found no fraud, bad faith or waste of the taxpayers money, it did find a violation of the law and declared the contract null and void. (Hubener-Florida)
W70-08028

SHARP V LEARNED (CHANGE OF RIVER CHANNEL BY ACCRETION OR AVULSION).
14 So 2d 218-222 (Miss 1943).

Descriptors: *Mississippi, *Accretion (Legal aspects), *Avulsion, *Boundary disputes, Judicial decisions, Mississippi River, Rivers, River flow, Alluvium, Boundaries (Property), Meanders, Bank erosion, Erosion, Sediments, Stream erosion, Channels, Real property, State governments, Louisiana, Legal aspects, Relative rights.

Becuase of the continuous change of the main channel of the Mississippi River, a dispute arose over whether certain lands lay within Mississippi or Louisiana. The court held that a transfer of territory by erosion on one side of a boundary river and accretion on the other becomes a part of the state to which it is added, whereas territory transferred by avulsion continues to be a part of the original state. Accretion or alluvion was defined as that added imperceptibly and gradually, and avulsion as a change measurably visible at the time of its progress. The distinguishing test was found to be with relation to the alluvion formed by accretion which normally runs parallel to the shore. Any remarkable departure from that rule within a short period of time was held to be an inference that there had been an avulsion. Under those rules the land in question was found to be formed as the result of avulsion and not by gradual erosion and accretion. (Douberley-Florida)

AVANAUGH V TEXAS DISTRIBUTING CO RTIFICIAL COLLECTION AND DISCHARGE F WATER; LIABILITY FOR ICE FORMA-ON).
NE2d 142-148 (Ohio Ct App 1942).

escriptors: *Ohio, *Ice, *Diversion structures, teration of flow, Flow around objects, Water reading, Resonable use, Surface waters, Surface noff, Drainage waters, Oil industry, Discharge Vater), Water release, Runoff, Judicial decisions, ater law, Impoundments, Impounded waters, alls, Excavation, Surface drainage, Concrete uctures.
entifiers: *Negligence.

fendants maintained a gas station located on a eply sloping hill. To construct the station, the e had to be filled and graded, and retaining walls re constructed to divert water off the premises. intiff was injured when he slipped and fell on ice he walked on the sidewalk along the boundary of fendants' property at a point where the retaining ll caused water to flow into the street. Plaintiff ntended that in changing the grade of the lot and nstructing the retaining walls, the defendants verted the natural course of surface water and eated an unusually dangerous condition in freez- weather. In holding for defendants, the court ted that a property owner can only be held liable a dangerous condition if he has caused the ar-cial accumulation of surface water and has charged it upon the public way in considerably eater amount than would have been discharged m natural causes. The court held that the dence did not disclose any attempt to artificially cumulate surface water or divert it from a normal h. The dissenting opinion advocated liability of jury could find that water had merely been ar-cially discharged from the premises. (Hubener-rida)

X V TICE (OWNERSHIP OF BED OF LAKE).

4 Misc 261, 298 NYS 441-455 (Sp Ct 1937).

scriptors: *New York, *Ownership of beds, oundary disputes, *Lake beds, Boundaries (Pro-ty), Legal aspects, Water law, Water rights, nds, Shores, Riparian rights, Relative rights, Ju-ial decisions, Land tenure, beds under water, merged lands, Lakes.

intiff and defendants owned riparian lands und a non-navigable lake. Their titles derived m letters patent from the state land office. Plain- brought this action to compel removal of cer-docks and piers and to enjoin defendants from king any further use of the pond on the ground t plaintiff was owner of the entire lake. Plaintiff tended that the letters patent to defendants' decessor in title did not convey any right or title he use of the lake. The court acknowledged that endants had acquired no rights or title by scriptive or adverse use but stated in holding for endants that the law presumes that riparian ners of lands adjoining fresh-water non-naviga- streams and lakes take title to the thread of the eam or the center of the body of water unless it arly appears that the adjacent waters are ex-ded from the conveyance. Where the grant is ned so as to touch the water, the bed of the eam or lake is presumed to be included. Thus the rds 'by the lake' or 'along the lake' contained in endants' letters patent conveyed title to the ter of the lake bed. (Hubener-Florida)

PLES V TALIAFERRO (EXCLUDING PARIAN RIGHTS IN MORTAGE).
So 861-872 (Fla 1940).

scriptors: *Florida, *Riparian land, *Beds under er, *Boundary disputes, Judicial decisions, tutes, Real property, Banks, Riparian rights, vigable waters, Ownership of beds, Riparian waters, High water mark, Beds, State governments, Shores, Seashores, Relative rights, Wetlands, Shallow water, Bays, Gulfs, Boundaries (Property), Legal aspects.

Defendant mortgage purchased two parcels of land, one to uplands down to the high water mark of a bay and the other to the submerged lands adjoining the uplands. The uplands were mortgaged, and the description in the instrument referred to a plat which showed a narrow walkway paralleling the water's edge. Plaintiff mortgagee argued that this strip was included in the mortgage description, giving him riparian rights to the submerged land and overlying water. The court held that the conveyance of the submerged property by the Internal Improvement Fund to defendant was proper, and that the security for the mortgage did not include the walkway and the adjoining submerged lands. The court further held that defendant had validly separated the uplands and the riparian property. The dissent felt that the intent to separate the two parcels was not made sufficiently clear in the instrument, and that the riparian land was not reserved to defendant. A conveyance of land abutting a walkway was thought to convey rights to water bordering the walkway on the other side. The dissent further found that the submerged lands were not the character of those authorized for sale by the fund. (Douberley-Florida)
W70-08035

CITY OF BIRMINGHAM V LAKE (FISHING RIGHTS IN WATER WORKS RESERVOIR).
10 So 2d 24-28 (Ala 1942).

Descriptors: *Alabama, *Reservoir storage, *Ownership of beds, *Fishing, Judicial decisions, Water supply, Dams, Reservoir operation, Water conservation, Water resources, Water works, Water quality, Impared water quality, Water quality control, Abatement, Legislation, Water pollution control, Domestic water, Industrial water, Cities, Beds, Lake beds, Beds under water, Public rights, Non-navigable waters.

As a part of its water supply system, the municipality acquired title to the bed of a lake which was formed by impounding the waters of a river. To preserve the water quality the municipality enacted an ordinance forbidding entry on the water works property without the permission of city officials. Petitioner alleged fishing rights in the waters of the lake as a member of the public. The court held that fishing rights on non-riparian waters are an incident to ownership of the beds, and that the municipality when acting in its proprietary capacity was to be treated as any other property owner. The rights of the public to use city property was held to be confined to the uses for which it was held. The city had an interest in preserving the quality of its water supply, and the police jurisdiction of the city extended to the lake owned by the city outside its corporate limits. (Douberley-Florida)
W70-08036

GREAT HILL LAKE, INC V CASWELL (PRESCRIPTIVE RIGHTS OF LANDOWNERS IN ARTIFICIAL LAKES).
126 Conn 364, 11 A2d 396-398 (1940).

Descriptors: *Connecticut, *Developed waters, *Prescriptive rights, *Easements, Dams, Fishing, Boating, Swimming, Land tenure, Public rights, Relative rights, Water rights, Lakes, Recreation, Impoundments, Watercourses (Legal), Lake beds, Beds under water, Ownership of beds, Judicial decision, Legal aspects.

Plaintiff owned a dam which had created an artificial lake. Defendants owned land bordering on the lake and under the waters of the lake. Plaintiff brought action for a determination of the respective rights of plaintiff and defendants in the lake. Defendants argued they had acquired prescriptive rights to fishing, boating, bathing, watering of stock, cutting of ice and taking of water for domestic uses. The lower court held for defendants but the appellate court reversed, stating that where such individual uses are in common with uses made by the public, the individual must perform some act to the knowledge of the servient owner clearly indicating his individual claim in order to establish a prescriptive right. However, plaintiff's right to flowage over defendants' lands was only an easement and, except as to the portion of land which plaintiff owned, he had no right to keep defendants from using the lake for boating, fishing, or bathing. The claims of the defendants as to watering of stock, cutting of ice, and taking for domestic purposes were adverse uses of plaintiff's property and were rights that could be acquired by the user. (Hubener-Florida)
W70-08038

IN RE HUTCHINSON RIVER PARKWAY EXTENSION (RIPARIAN RIGHTS TO ACCRETION CAUSED BY ARTIFICIAL MEANS).
14 NYS2d 692-697 (Sup Ct 1939).

Descriptors: *New York, *Condemnation, *Riparian rights, *Accretion (Legal aspects), Boundaries (Property), Boundary disputes, Community development, Highway beautification, Judicial decisions, Legal aspects, Local governments, Proprietary powers, Public benefits, Riparian lands, Riparian waters, Watercourses (Legal), Condemnation value, Eminent domain, Public rights, Highways, Real property, Currents (Water).
Identifiers: Tide gates.

The City of New York had condemned for the extension of a parkway certain lands adjacent to the Hutchinson River. Portions of the condemned land had earlier accreted to the landowners along the river when the river's course was changed by the erection of tide gates. The issue was whether the city was liable to the landowners for the condemnation of this additional soil, the accretion of which was brought about by artificial means. The court held that the fact that the labor of other persons changed the current of the river and caused the accretion could not deprive the landowners of the right to it. The owners were entitled to a condemnation award for the land created by accretion and taken by the city. (Clarke-Florida)
W70-08041

VILLAGE OF FLEISCHMANNS V HYMAN (RELATIVE RIGHTS OF MUNICIPALITIES AND STATE AGENCIES TO REGULATE DAM MAINTENANCE).

164 Misc 175, 298 NYS 564-570 (Sp Ct 1937).

Descriptors: *New York, *Cities, *Dams, *Supervisory control (Power), Dam construction, Dam failure, Civil engineering, Structures, Municipal water, Public benefits, Local governments, State governments, Administrative agencies, State jurisdiction, Legislation, Building codes, Permits, Legal aspects, Judicial decisions, Bulkheads, Impoundments, Maintenance, Relative rights, Impounded waters.
Identifiers: *Dam maintenance.

Defendant maintained in an unsafe condition a dam within the plaintiff village. Plaintiff village sought an injuction to enforce a village ordinance relating: to the construction, maintenance, and operation of dams and; to bulkheads over waters within the village. The court ruled that plaintiff was required to prove both the existence of the dangerous condition and that the ordinance in question was a proper and authorized exercise of municipal power. In holding for defendant, the court held that the state conservation law vested in the state Superintendent of Public Works full and exclusive authority over structures impounding water. Since municipal corporations derive their power from statutes, they cannot of their own initiative abrogate other state statutes or adopt local laws and ordinances conflicting or inconsistent with the provisions or purposes of state legislation. In

prescribing a lesser penalty for an offense controlled by state law, the village had usurped the function of state provisions. (Hubener-Florida)

IN RE HUTCHINSON RIVER PARKWAY EXTENSION (CONDEMNATION VALUE OF RIPARIAN LAND).

33 NE2d 252 (NY 1941).

Descriptors: *New York, *Eminent domain, *Parks, *Condemnation value, Rivers, Highways, Road construction, Highway beautification, Judicial decisions, Legal aspects, Administrative agencies, Cities, Damages, Easements, Scenic highways, Land use, Riparian rights, Roads, Boundaries (Property), Condemnation, Compensation, Interest, Interest rate.

The city of New York acquired title to certain real property for the Hutchinson River Parkway Extension and for a park site. The property taken consisted of 19.6 acres fronting the Hutchinson River. The property taken amounted to approximately twenty-four per cent of claimant's total property. After the taking, claimant had two parcels of land remaining, which were separated by the parkway. The trial court awarded twelve cents per square foot for the portion of the claimant's property actually taken, but made no award for damage to the remaining land on each side of the parkway. The appellate division modified the award by increasing the rate of interest payable on the award. The Court of Appeals of New York affirmed. (Barnett-Florida)

CONFER V PIRMAN (BOUNDARY DISPUTE AS TO POND BED).
286 NYS 192-197 (App Div 1936).

Descriptors: *New York, *Boundary disputes, *Ponds, *Ownership of beds, Boundaries (Property), Lakes, Legal aspects, Water law, Water rights, Shores, Riparian rights, Relative rights, Judicial decisions, Land tenure, Lake beds, Beds under water, Submerged lands, Real property.

Plaintiff and defendants held adjoining land from a common grantor. The grantor had conveyed land 'on the east side' of a pond to defendants' predecessors in title. The grantor subsequently conveyed the rest of the land in the quarter to plaintiffs. Plaintiffs contended that defendants had acquired no title to land under water by their deed and that plaintiffs were the owners of the entire pond. Defendants contended that the deed in question conveyed title of the pond to the center line thereof. The lower court held for defendants and the appellate court affirmed, reciting only the facts of the case. The dissent, noting that the boundary in conveyances by several of defendants' predecessors in title had been described as 'running along the water's edge,' stated that the defendants had not acquired any lands west of the east side of the pond. LOHR V UPPER POTOMAC RIVER COMM'N (POWER OF COMMISSION TO SUE AND BE SUED DID NOT APPLY TO TORT ACTIONS FOR NEGLIGENCE).
26 A2d 547-550 (Md 1942).

Descriptors: *Maryland, *State governments, *Administrative agencies, *Public rights, Administration, Legislation, Adjudication procedure, Flood control, Water resources development, Judicial decisions, Legal aspects, Third party effects, Political aspects, State jurisdiction.

Plaintiff brought suit in tort for injuries sustained in an automobile accident allegedly caused by the negligence of defendant river commission's employees in placing rocks and debris on a public highway. The court, in holding for defendant, stated that it was within the power of the state to establish a district for the control of state waters and to insure adequate water supplies and flood control. As a governmental agency performing a governmental function, defendant shared the state's immunity from suit. The statutory words empowering the commission to sue and be sued applied only to such suits as were necessary to carry out the purposes for which the commission was created. A tort action could not be maintained where no authorization was given to the commission or the state to provide funds to pay damages in a tort action. (Hubener-Florida)

BARCUS V BLANCHARD (OWNERSHIP OF FORMER LAKE BED).
135 NJ Eq 533, 39 A2d 499-505 (1944).

Descriptors: *New Jersey, *Ownership of beds, *Beds under water, *Boundary disputes, Lake beds, Streambeds, Riparian rights, Boundaries (Property), Islands, Lakes, Legal aspects, Judicial decisions, Dams, Spillway gates, Reservoirs, High water mark, Ponds, Real property.

A real estate company conveyed land to defendant which contained the marshy basin of a former artificial pond. The basin was traversed by a stream which had formerly been dammed to create the pond. The deed from the real estate company's grantor had expressly conveyed the land to the edge of the lake at the time of conveyance. Defendant began dredging operations in the basin to create a reservoir. Plaintiff, a descendant of the original grantor, sought an injunction to halt the dredging claiming ownership of the basin. Defendant also claimed title to the bed. In holding for plaintiff, the court acknowledged the rule that without express words of exclusion, a conveyance of lands abutting upon an artificial lake ordinarily conveys title to the medium filum of such lake. However, the words of the grant and the intentions of the parties should also be considered in determining whether title to submerged land had passed. The court, in construing the deed, found it conveyed title only to land extending to the height of the lake at the time of the original conveyance. The court found persuasive that at the same time the original grantor had conveyed adjoining land extending title by express provision to the middle of the pond. (Hubener-Florida)

MCGAHHEY V MCCOLLUM (USE OF A NON-NAVIGABLE WATERCOURSE).
179 SW2d 661-664 (Ark 1944).

Descriptors: *Non-navigable waters, *Arkansas, *Navigable waters, *Boundaries (Property), Reasonable use, Legal aspects, Judicial decisions, Ownership of beds, Riparian rights, Non-consumptive use, Recreation, Fishing, High water mark, Watercourses (Legal), Water level fluctuations, Lakes, Lake shores, Hunting, Waterfowl, Relative rights, Usufructuary right.

Suit was brought to enjoin defendants from interfering with plaintiffs' use and enjoyment of a certain lake for hunting, fishing and other purposes. The trial court found that the lake had never been used for commercial navigation and was non-navigable for any purpose. The court also found that defendants, as the owners of the entire body o land surrounding the lake, were also the owners o the land underlying the lake, their opinion being based on the law of Arkansas that a riparian owne on a non-navigable stream owns to the center of it The issue on appeal was whether the lake was in fact navigable. If it was navigable, defendant owned only to the high water mark. The cour stated that to be navigable, a watercourse mus have a useful capacity as a public highway of trans portation. The lake in question was found to b non-navigable, and consequently the trial court' holding that plaintiffs were not entitled to the us of the lake as a matter of right was affirmed. WINANS LAKE HILLS CORP V MOOR (RIGHTS TO RECREATIONAL USE OF POND).
284 Mich 688, 280 NW 81-83 (1938).

Descriptors: *Michigan, *Farm ponds, *Prescrip tive rights, Lakes, Lake shores, Recreation, Rela tive rights, Riparian rights, Land use, Land tenure Water utilization, Fishing, Contracts, Judicial deci sions, Legal aspects, Boundaries (Property), Com peting uses, Boating, Usufructuary right.

Defendants owned land abutting on a private non navigable pond. Defendants' predecessors in titl had conveyed away all rights to use of the pond ex cept for watering of stock, cutting of ice, and draw ing water for domestic purposes. Plaintiff corpora tion, owner of the pond, sought to restrain defen dants' use of the pond for boating and fishing pur poses. Defendants claimed to have acquired rights by prescription or estoppel, to use the lake fo boating and fishing purposes since they had beer doing so for several years. The court granted the in junction holding that the evidence did not establis adverse use by defendants. Such use of the lake a defendants made was by permission of the plaintiff and their predecessors in title. (Hubener-Florida)

WEINBURGH V SAIER (NATURAL STREAMS AS PROPERTY BOUNDARIES).
6 NW2d 921-923 (Mich 1942).

Descriptors: *Michigan, *Boundaries (Property) *Streams, *Boundary disputes, Land tenure, Judi cial decisions, Meanders, Rivers, Beds, Land ap praisal, Remedies, Overflow, Bank erosion, Acre age, Legal aspects, Ownership of beds, Real pro perty.
Identifiers: *Meander line, *Homesite.

Defendant land vendor owned a parcel of land bor dered on two sides by a river. Plaintiff vende purchased two residential lots from defendan which bordered this river. Each lot was supposed t contain 8 acres. After purchase, plaintif discovered that neither of his lots consisted of acres, and sued for reformation of the contract. De fendant claimed that the acreage should be com puted to the meander line of the stream whic would then give the plaintiff 8 acres per lot. Th court held that while abutting property runs to th meander line of a stream, it is not customary whe figuring lots for homesites to also include lan under water. Plaintiff was correct in not computin his acreage to the meander line, and consequentl the court reformed the contract as requested. (Si serson-Florida)

RON CANAL AND HYDRAULIC CO V FON- INE (RIGHT TO RECREATIONAL USE OF MMED WATER BY RIPARIAN OWNERS).
Ohio App 93, 50 NE2d 897-902 (1943).

scriptors: *Ohio, *Usufructuary right, *Riparian ts, *Dams, Lakes, Water storage, Reasonable , Lake beds, Fishing, Boating, Non-navigable ers, Natural streams, Water utilization, Water- rses (Legal), Impoundments, Dam construc- , Legal aspects, Dam sites, Judicial decisions, ative rights.

intiff was the proprietor of a dam on a non- igable stream. The dam had created a large lake ch defendant riparian owners used for fishing boating. Plaintiff, who held title only to the site area, brought this action to restrain the de- dants, individually and collectively, from using lake for fishing and boating. The court acknowledged that there was no public right to fish or boat in a natural, non-navigable lake. However, the court held for defendants stating that a proprietor of a dam on a non-navigable stream does not acquire ownership of water stored behind his dam. The water, unlike land, is not property and not the subject of ownership. The proprietor acquires a usufructuary right to the water and is entitled to make reasonable use of it. Plaintiff's right to flowage, storage and withdrawal of water from the dammed area did not also include exclusive fishing and boating privileges as incident and appurtenant to the water rights. RESERVOIR RECREATION CORP V HODDER (PROPERTY RIGHTS IN BEDS UNDER WATER).
29 NE 2d 913-915 (Mass 1940).

Descriptors: *Massachusetts, *Reservoirs, *Riparian rights, *Beds under water, Highwater mark, Riparian waters, Recreation, Wildlife, Landfills, Structures, Riprap, Lakes, Banks, Lake beds, Recreation facilities, Swimming, Public health, Reservoir operation, Social aspects, Construction, Judicial decisions, Legal aspects, ownership of beds, Real property, Docks, Relative rights, Usufructuary right.

Plaintiff corporation was organized to encourage aquatic enjoyment to promote the study and propagation of wildlife and to provide for recreation and social enjoyment of its members. Plaintiff owned land covered by the waters of a lake to the high water mark. Defendant owned land above the high-water mark. Defendant constructed and maintained a dock, float, wall and fill which allegedly encroached on plaintiff's property. Plaintiff brought action to compel the removal of these structures. The court found the maintenance of the structures complained of constituted a continuing trespass against the plaintiff for which a mandatory injunction would issue even though the damage might be slight and the expense of removal disproportionate. UNITED STATES LEATHER CO V CITY OF LYNN (TITLE TO AND BOUNDARIES OF SUBMERGED LAND).
199 NE 313-315 (Mass 1935).

Descriptors: *Massachusetts, *Ponds, *Boundaries (Property), *Ownership of beds, Cities, Mills, Judicial decisions, Legal aspects, Contours, Elevation, Riparian rights, Obstruction to flow, Reasonable use, Prior appropriation, Mill dams, Structures, Pipes, Flow, Grants, Legislation, Great ponds, Surface waters, Boundary disputes, Real property.

Plaintiff petitioned to register title to a mill pond under a grant which was the subject of construction by the trial court. Petitioner asserted title in fee to the pond up to a water line of an elevation of 74, Lynn city base. Defendant-city claimed title in itself subject to the right of petitioner to use the pond at that elevation. The court traced the chain of title in the pond through 300 years and found that the grant made to petitioner was of the fee of the pond including all land within its borders, subject to the right of an unobstructed flow therefrom for mills on the stream below. The court further determined that contour 74 of the pond was not an arbitrary line, but was the water line at the elevation of the dam as regulated by an overflow pipe. (Barnett-Florida)

HOOD V MURPHY (Public right to fish in non-NAVIGABLE STREAM).
6 Div 862, 165 So 219-221 (Ala 1936).

Descriptors: *Alabama, *Fishing, *Non-navigable waters, *Ownership of beds, Streambeds, Boundaries (Property), Upstream, Navigable rivers, Fresh water, Federal government, Streams, Legal aspects, Judicial decisions, Remedies, Public lands, Public rights, Patents, Freshwater fish, Relative rights, Land tenure, Real property, Recreation demand.
Identifiers: *Injunction, Trespass.

A small, fresh-water stream passed through plaintiff's property. It appeared that fish were plentiful in this non-navigable stream, especially within plaintiff's boundary lines. Over plaintiff's protests, defendant entered the stream below plaintiff's property line and proceeded upstream within plaintiff's boundaries. Defendant then proceeded to fish, as he stood on the river bottom. Plaintiff sought to enjoin such fishing. Contending the state owned the river bed, defendant maintained that he had not actually trespassed upon plaintiff's property. The court, however, held that the state owned only navigable streambeds. The lands upon which non-navigable streams were located had once been public land, ceded to the United States. However, the federal government patented this land and passed title to patentees and their successors in ownership. The public had no right to fish in waters flowing over such land. Plaintiff, therefore, had exclusive fishing rights in the non-navigable stream. (Finman-Florida)

CITY OF SYRACUSE V GIBBS (STATE CONTROL OVER POTABLE WATER DISTRIBUTION).

258 App Div 405, 17 NYS2d 293-302 (Sup Ct 1940).

Descriptors: *New York, *Administrative decisions, *State jurisdiction, *Water supply, Community development, Equitable apportionment, Judicial decisions, Legal aspects, Legislation, Local governments, Preferences (Water rights), Public rights, Public benefits, Relative rights, State governments, Water rights, Administrative agencies, Water allocation (Policy), Water demand, Cities, Conduits.
Identifiers: *Public trust doctrine.

Defendant water commission issued an order forcing plaintiff city to allow a smaller village to tap into its water supply conduit. The village was to draw off up to 69 million gallons per year at a fixed rate payable to defendant. Plaintiff had obtained its right to use and consume the water of a particular lake by a series of state statutory grants. Plaintiff contended that these grants entitled it to operate without interference, and that defendant had no authority to issue such an order. The court held that the distribution of potable water is a right held in trust by the state for the benefit of all its inhabitants. Therefore, a state may not divest itself of control of rights held for the benefit of all the people. The commission was by statute delegated the

power to supervise the equal distribution of potable water to the residents of the state. However, the defendant commission was not given express statutory power to exercise ownership and dominion over the conduits constructed and owned by plaintiff, nor was it given statutory power to set specific rates which plaintiff must charge for the use of the conduits by the village. The commission's order was annulled. (Clarke-Florida)

EASTON V STATE (DAMAGES TO RETAINED PORTION OF LAND CAUSED BY USE OF APPROPRIATED PORTION).

245 App Div 439, 283 NYS 809-812 (App Div 1935).

Descriptors: *New York, *Springs, *Eminent domain, *Condemnation value, Subsurface waters, Wells, Underground streams, Underground, Road construction, Highways, Highway effects, Judicial decisions, Legal aspects, Water pollution, Water pollution effects, Groundwater, Civil engineering, Condemnation, Right-of-way, Relative rights, Land use, Compensation.
Identifiers: State governments, Condemnation.

Plaintiff landowner was awarded a fair amount of compensation for land taken by the state in the vicinity of a railroad crossing. Plaintiff continued to live on adjacent property and reserved the right to take water from a spring located on a portion of the appropriated land. The state constructed a new highway over the appropriated land and dirt and roily substances from the gutter percolated into the subterranean watercourses which fed the spring. The spring was rendered useless to plaintiff and he sought compensation for the damages accruing to the retained land. The court, in holding for plaintiff, stated that the damages had resulted from the initial taking of his land and the construction of the hiighway. Where land is taken without the consent of the owner, he is entitled to recover the market value of the property and any damages to the residue by reason of the use to which the appropriated part is put. GROBART V PASSAIC VALLEY WATER COMM'N (PRESCRIPTIVE RIGHTS TO DIVERT WATER).

135 NJ Eq 38, 37 A2d 98-99 (1944).

Descriptors: *New Jersey, *Diversion, *Prescriptive rights, *Reasonable use, Judicial decision, Legal aspects, Routing, Riparian rights, Water works, Water demand, Water supply, Consumptive use, Preferences (Water rights), Domestic water, Priorities, Rivers, Remedies.

Complainants were owners of land bordering the Passaic River. They sought to enjoin defendant from abstracting water from the river above their lands. Defendant's defense was that it had title or a prescriptive right to the water arising out of continuous user of the water for twenty years. Defendant did not dispute complainants' right to prevent abstraction in excess of the prescriptive right, but argued that the amount of the user allowed should be the average of the twenty years use and not, as plaintiff alleged, the minimum amount used in any single year. The court, in holding for plaintiff, stated that the extent of a prescriptive right to divert water from a river could not exceed the lowest average daily abstraction of any one year. (Barnett-Florida)
W70-08085

GROBART V PASSAIC VALLEY WATER COMM'N (PRESCRIPTIVE RIGHT TO DIVERT WATER--COMPUTATION OF ALLOWABLE DIVERSION AMOUNT).
34 A2d 284-285 (N J Ch 1943).

Descriptors: *New Jersey, *Diversion, *Prescriptive rights, Reasonable use, Judicial decisions, Legal aspects, Routing, Riparian rights, Water works, Water demand, Water supply, Consumptive use, Preferences (Water rights), Domestic water, Priorities, Rivers, Usufructuary right.

Complainant, who owned land bordering on the Passaic River on which factory buildings were erected, sought an injunction against defendant's allegedly unlawful and injurious diversion of water at a point above her lands. Defendant claimed a prescriptive right based on adverse user of the waters for a period of at least twenty years. Objection was raised by complainant as to the method of computation and accuracy of the measurement of the amount of waters diverted by defendant. Defendant measured average daily flow through the meters for each month, then added the total of a twelve months' flow and divided the total by twelve. The court held that this method of computation was adequate, and that defendant had established an adverse user which had ripened into a prescriptive right to divert a daily average of water equaling 22.6 million gallons. However, the proofs had shown that defendant had exceeded that figure, and consequently complainant was entitled to an injunction against a greater diversion than 22.6 million gallons. (Barnett-Florida)
W70-08086

PAMRAPAU CORP V CITY OF BAYONNE (RELATIVE RIGHTS IN SUBMERGED LAND IN FRONT OF RIPARIAN PROPERTY).
8 A2d 835-837 (N J Ch 1939).

Descriptors: *New Jersey, *Ownership of beds, *Riparian rights, *Riparian land, Beds under water, Harbors, Water law, Condemnation, State governments, Local governments, Land tenure, Navigation, Docks, Piers, Judicial decisions, Legal aspects, Relative rights, Riparian waters, Land use, Leases, Grants, Compensation.

Plaintiff was a riparian owner of lots bordering on New York Bay. In 1886 defendant city, which then owned the lots, received through a state grant rights to use the land under water infront of the lots for public purposes such as construction of docks. The right was to continue as long as defendant owned the lots. Defendant subsequently sold the lots and plaintiff eventually acquired them. After plaintiff's acquisition, defendant attempted to lease the same submerged lands to defendant construction corporation for construction of a marine terminal. Plaintiff sought: (1) to remove the cloud upon his title to the lots caused by the lease; and (2) either an injunction against the construction of the terminal or damages for the deprivation of his riparian rights. The court ruled that defendant city had acquired an estate upon limitation in the grant from the state and by its conveyance of the upland lots lost the rights granted with respect to the submerged lands. Riparian owners hold pre-emptive rights to grants or leases of submerged lands in front of their uplands unless, after six month notice of a proposed state grant, the owner fails to apply for such a grant. On failure to so apply, such an owner is still entitled to compensation, since this riparian right is a property right. Defendant was given time to acquire complainant's rights either by purchase or condemnation. (Hubener-Florida)

appellant Attorney General of Florida sought
nctive relief and cancellation and recission of
il lease granted by the Trustees of the Florida
mal Improvement Fund. The lands leased were
er navigable waters, and the Attorney General
ended that the lease thereof was in conflict
the trust doctrine. He also contended that
e was no state constitutional or statutory
ority for such lease. The court held that subject
e authority of Congress over navigable waters,
subject to vested private property interests, the
has power to legislate concerning the disposi-
and use of lands beneath navigable waters
in the territorial limits of the state. Such
lative acts must be within the bounds set by the
constitution. It has long been the established
ic policy that the state may, if done in ac-
ance with the appropriate statutes, part with
ions of its land under navigable waters. Statutes
empower the Trustees to lease land under state
rs to individuals for drilling purposes. The
s of the lease provided safeguards against ob-
onable operation of the wells and possible pol-
n. The decree appealed was affirmed. (Price-
ida)

THE ENVIRONMENTAL DISPOSITIONS OF ENVIRONMENTAL DECISION-MAKERS,
California Univ., Berkeley.
Kenneth H. Craik.
Annals of the American Academy of Political and Social Science, Vol 389, May 1970. p 87-94, 27 ref.

Descriptors: *Decision making, *Environment, *Psychological effects, *Social aspects, Attitudes, Social values.
Identifiers: *Environmental disposition, Environmental decision maker.

A new interdisciplinary field of research has recently emerged which studies how persons comprehend the everyday physical environment, how they use it, how they shape it and how they are shaped by it. In seeking an objective understanding of the behavioral aspects of the total personal-societal-environmental system, professional environmental decision-makers, such as architects, urban planners and natural-resources managers, are strategic choices for psychological study. Within this context of environmental design and management, research is being directed toward clarifying the implicit assumptions about environmental behavior held by decision-makers, overcoming social and administrative distances from clients, and conducting systematic follow-up evaluations of the behavioral consequences of planning and design decisions. However, subtle and precise study of man-environment relations will require the development of psychological techniques providing a comprehensive and differentiated description of any person's orientation to the everyday physical environment. Methods for measuring individual differences in environmental dispositions are reviewed and their potential usefulness for advancing knowledge of the interplay between human behavior and the physical environment is illustrated. 07. RESOURCES DATA

7A. Network Design

NATIONAL SYSTEM FOR WATER DATA,
Geological Survey, Washington, D.C. Water Resources Div.
Russell H. Langford, and George H. Davis.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY7, Paper 7392, p 1391-1401, July 1970. 11 p, 2 fig.

Descriptors: *Data collections, *Hydrologic data, *Data storage and retrieval, *Information retrieval, Data processing, Documentation, Legislation, Governments, Libraries, Publications, Federal Government.
Identifiers: Data management, National system for water data, Office of Water Data Coordination.

Bureau of the Budget Circular A-67, August, called for coordination of certain water data acquisition by Federal agencies. The Department of the Interior's Office of Water Data Coordination was given responsibility to: (1) Design and operate a National Water Data Network; (2) coordinate national network and specialized water data activities and prepare an annual Federal Plan for water data acquisition; and (3) maintain a catalog of information on water data, and on Federal activities planned or conducted to acquire such data, and to organize network data. The Catalog of Information on Water Data is a file of information on water data acquisition activities and Indexes are published. A level of information approach to network design has three informational levels: Level I, base level for national and regional planning; Level II, subregional planning objectives; Level III, local operation and management objectives; the accounting element of the Level I, streamflow and stream quality was designed. An Interior Water Data System was developed and will be expanded to non-Interior Federal agencies. Field coordination initially will involve four field coordinators to review agency plans and needs for water data. (Knapp-USGS)

THE DESIGN OF NOZZLE NETWORKS FOR THE SIMULATION OF RAINFALL,
Imperial Coll. of Science and Technology, London (England).
M. J. Hall.
Journal of Hydraulic Research, Vol 7, No 4, p 449-483, 1969. 35 p, 12 fig, 3 tab, 6 ref.

Descriptors: *Rainfall simulators, *Hydraulic models, *Rainfall-runoff relationships, Artificial precipitation, Simulated rainfall, Instrumentation, Nozzles, Rainfall disposition, Distribution patterns.
Identifiers: Nozzle networks.

A method is given for designing a network of nozzles to generate artificial rainfall. A simple design of swirl-type nozzle was devised and the effect of the internal geometry of the swirl-producing component of this nozzle on its dispersion properties is illustrated. Statistical coefficients are used as measures of the uniformity of the application pattern from a network of nozzles. A method of generating the patterns from networks with different spacings of nozzles by using the distribution of depths from one nozzle is outlined, and the details of a computer program for performing the calculations are presented. HYDRODYNAMIC STUDIES OF TIDE GAUGES,
Liverpool Univ. (England). Dept. of Civil Engineering.
A. Roy Halliwell, and John G. Perry.
Journal of Hydraulic Research, Vol 7, No 4, p 485-517, 1969. 33 p, 12 fig, 2 tab, 11 ref.

Descriptors: *Tidal waters, *Gaging stations, *Water levels, *Instrumentation, Gages, Stream gages, Calibrations, Water measurement, Laboratory tests.
Identifiers: Tide gages.

When tide gages of the float and well type are situated so that there is a flow past them, an error is introduced into their readings as a result of the flow. A relationship was developed for the well orifice pressure coefficient in terms of Reynolds number, Frounde number and two geometric ratios. The relationship was investigated by model tests on various tidewell end-shapes and orifice configurations. The wells giving least error from this effect are found to be the shrouded cone and the standard American gage. A study was made of the magnitude of current error and several alternatives for eliminating it are suggested. (Knapp-USGS)

MONTANA TELEMETRY SYSTEM,
Soil Conservation Service, Bozeman, Mont.; and Montana State Univ., Bozeman. Dept. of Engineering.
Phillip E. Farnes, and John Rompel.

Proceedings 37th Annual Meeting of Western Snow Conference, April 15-17, 1969, Salt Lake City, Utah; printed by Colorado State University, Fort Collins, p 102-107, 1969. 6 p, 4 fig.

Descriptors: *Remote sensing, *Telemetry, *Snow surveys, *Montana, Data collections, Instrumentation, Streamflow forecasting.
Identifiers: Snow survey telemetry.

The snow survey telemetry system in use near Bozeman, Montana consists of 3 remote data sites, 2 repeaters, and a base station. Propane generators power the repeater station. Four dry cell batteries provide a 1-year power supply for the remote sites. A clock at the site initiated hourly transmission of snow pillow, total precipitation, and air temperature data. Snow pillow and precipitation data were obtained from potentiometers attached to Leupold-Stevens Type F recorders. A thermistor bridge is used as a temperature sensor. Received data are recorded automatically on Esterline-Angus strip chart recorder at the Snow Survey office in Bozeman. Pressure transducers were substituted in the hydraulic system to replace the potentiometers. Data can most advantageously be transmitted in analog form, allowing the remote site equipment to be kept as simple (hence trouble free and low cost) as possible. Punched paper tape was chosen as the most economical form of data record for computer input. All equipment is solid state. The automatic call-up sequence can be initiated by an external timer or a noon or midnight or both by the digital clock in the digital data recorder. With continuous data, need for regular snow surveys on specific dates is reduced. Field measurements can be adjusted to first-of-month or mid-month readings by comparing with telemetered data. Early season measurements can be greatly reduced as correlation between pillows and snow courses is developed. Accurate data on melt, heavy precipitation, and other unusual climatic occurrences can be noted as they occur. Accurate measurements of total precipitation can be obtained by using both snow pillows for snowfall and precipitation gages for rainfall and combining them. (See also W70-07530). (Knapp-USGS)

7B. Data Acquisition

APPLICATIONS OF AIRBORNE REMOTE SENSING TECHNOLOGY,
Wisconsin Univ., Madison. Dept. of Civil Engineering.
Ralph W. Kiefer, and James P. Scherz.
ASCE Proceedings, Journal of the Surveying and Mapping Division, Vol 96, No SU 1, Paper 7225, p 57-80, Apr 1970. 24 p, 19 fig, 44 ref.

Descriptors: *Remote sensing, *Aerial photography, Radar, Thermal radiation, Photogrammetry, Infrared radiation, Water pollution, Soil surveys, Terrain analysis, Monitoring, Planning.
Identifiers: Side-looking radar.

Recent developments in aerial photography, such as color film, color infrared film, and multiband photographic systems, have greatly increased the amount of useful information obtainable from aerial photographs. Remote sensing instruments that operate in different parts of the electromagnetic spectrum from the human eye and photographic sensors can detect many things beyond the scope of human and photographic sensors. Thermal imagery can detect thermal pollution entering streams. Side-looking airborne radar can map terrain day or night, almost without regard for weather conditions. Remote sensing instruments having civil engineering applications are described herein. The emphasis is on photography, thermal imagery, multispectral imagery, and side-looking airborne radar. Applications of airborne remote sensing technology to soils mapping, water pollution detection and monitoring, and urban and regional planning are illustrated. (Knapp-USGS)
W70-07649

FLOW ANALYSIS OF LARGE TRIANGULAR WEIR,
Agricultural Research Service, Chickasha, Okla.
Donn G. DeCoursey, and Bruce J. Blanchard.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY7, Paper 7405, p 1435-1454, July 1970. 20 p, 9 fig, 3 tab, 11 ref, 5 append.

Descriptors: *Weirs, *Flow measurement, *Gaging stations, *Alluvial channels, *Calibrations, Open channel flow, Streamflow, Instrumentation, Unsteady flow, Stream gages, Stage-discharge relations.
Identifiers: Large triangular weirs.

V-notch weirs have often been used to stabilize the ratings of streamflow stations in unstable alluvial channels. The theoretical development and interaction of weir flow, submergence, and unsteady flow are discussed. Two different equations are derived to describe weir flow. The equations are more accurate than conventional weir flow equations. If the weir rating is based upon both the static and velocity heads, the effect of submergence is one of a superposition of flows. The rate of change of stage does not fully define unsteady flow. (Knapp-USGS)
W70-07660

STREAMFLOW FORECASTING, A VITAL ELEMENT IN WATER MANAGEMENT,
Bureau of Reclamation, Salt Lake City, Utah.
David L. Crandall.
Proceedings 37th Annual Meeting of Western Snow Conference, April 15-17, 1969, Salt Lake City, Utah; printed by Colorado State University, Fort Collins, p 92-96, 1969. 5 p, 4 fig.

Descriptors: *Streamflow forecasting, *Colorado River, *Snow surveys, *Reservoir operation, Optimization, Multiple-purpose projects, Hydroelectric power, Irrigation, Recreation, Water management (Applied), Planning.

Within the constraints of operating the reservoirs of the Colorado River Storage Project to meet Compact delivery requirements for fish and wildlife, float boaters and other recreationists, to control floods, help highway bridge builders, and aid water deliveries for communities, farms, and industries, there is still opportunity to attempt optimum use of the available water for power production. The bulk of the cost of the storage project is being paid by power production. Project water use comes in the form of electric energy over a wire. Project power income is now about $20 million per year. With the combined effect of streamflow plus the head versus volume relationship being unique at each reservoir with a powerplant, the distribution of storage among the reservoirs is aimed at developing maximum systems energy and capacity. The streamflow forecasting method used by the Bureau of Reclamation is based on a correlation of streamflow at a particular site with the accumulated precipitation at selected gaging stations plus snow depths at specific courses within the contributing drainage basin. Above Glen Canyon Dam, the Bureau uses precipitation stations and 48 snow courses. Emphasis is placed on the application of the probability of the forecast runoff deviating from the actual runoff. Most management decisions recognize a deviation range exceeded less than one out of ten times in the past. (See also W70-07530) (Knapp-USGS)
W70-07677

GEOLOGICAL STRUCTURES OF THE RED SEA AREA INFERRED FROM SATELLITE PICTURES,
North American Rockwell Corp., Thousand Oaks, Calif. Science Center.
Monem Abel-Gawad.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea; published by Springer-Verlag New York Inc. p 25-37, 1969. 13 p, 5 fig, 15 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Geology, *Oceanography, Brines, Mineralogy, Sea water, Water chemistry, Water temperature, Photography, Aerial photography, Faults (Geology), Fractures (Geology), Exploration, Surveys, Geophysics.
Identifiers: *Red Sea, Hot Brines.

Photographs of the Red Sea area taken during the Gemini earth-orbiting missions show the gross structural relationship between the highlands of the Arabian-Nubian shield, the sediment-filled Red Sea 'graben' system and the marginal sedimentary cover with large areas of volcanic activity. Among five major systems of faults affecting the Arabian-Nubian massif, three systems trending N, NW, and WNW appear to have a profound influence on the structure of the Red Sea. The other systems oriented NE and E are more evident in the Gulf of Aden area. The fissure systems control the coastal outlines, and major physiographic features such as deptessions, drainage lines, and much of the Nile Valley. The relative positions of two pairs of shear zones intersecting the northern part of the Red Sea provide additional geological evidence consistent with the relative northward movement of Arabia some 150km. The regional fissure system disposition may be interpreted in terms of a combination of shear and tension producing conjugate fissures and gravity faults. (See also W70-07394) (Knapp-USGS)

THE RED SEA -- A GEOPHYSICAL BACKGROUND,
Newcastle-upon-Tyne Univ. (England). School of Physics.
R. W. Girdler.
In: Hot Brines and Recent Heavy Metal Deposits in the Red Sea, published by Springer-Verlag New York Inc, p 38-58, 1969. 21 p, 8 fig, 1 tab, 93 ref.

Descriptors: *Geophysics, *Faults (Geology), Brines Mineralogy, Hot springs, Sounding, Exploration, Geology.
Identifiers: *Red Sea, Continental movements.

The history and evolution of the Red Sea are considered in the light of the continental movement of Africa and Arabia. The relevant palaeomagnetic data pertaining to the latter are summarized. The Red Sea developed in phases, and it is likely that these correspond in time to phases of continental drift. The geophysical data for the Red Sea are summarized by considering the Red Sea in three parts; the northern Red Sea (north of 25 deg N), the central Red Sea (17 deg to deg N),AND SOUTHERN Red Sea (south of 17 deg N). Structural differences from to south are noted. Finally a summary is given for the evolution of the Red Sea taking into account geophysical and geological data for the whole Afro-Arabian region. DESIGNING THE LININGS OF PRESSURE TUNNELS IN ANISOTROPIC ROCK,
V. S. Eristov.
Gidrotekhnicheskoe Stroitel'stvo, No 3, p 28-31, 1965. Transl from Russian by the Bureau of Reclamation, Trans 740, March 1970. 11 p, 3 fig, 4 ref.

Descriptors: *Tunnel linings, Anisotropy, Elastic theory, Elastic deformation, Stress, Displacements, *Structural analysis, Structural design, Tensile stress, *Foreign design practices, Rocks, *Pressure tunnels , Rock properties, *Radial stress, *Rock mechanics, Theoretical analysis, Tunnel design, Equations, *Deformation.
Identifiers: Radial loads, Rock pressures, USSR, Elastic coefficient, Formulas, Deformation restraint.

Formulas are derived for the stresses and radial deformation of a pressure tunnel lining in anisotropic rock using the theory of elasticity. The surrounding rock is assumed to be transformed into a monolithic elastic medium by grouting. Considering, with small error, only radial components of deformation and elastic resistance is possible. By using a constant coefficient of elastic resistance, the formulas are transformed into the formulas for an isotropic medium. The deformations obtained by these formulas for a thin lining coincide reasonably well with the corresponding deformations for an opening in an orthotropic medium loaded along the contour with a uniform radial load. A sample calculation is given. (USBR)

DESIGN OF TUNNEL SUPPORT SYSTEMS,
Illinois Univ., Urbana; and Mathews (A.A.), Inc., Arcadia, Calif.
U. D. Deere, R. B. Pack, and J. Monsees.
Paper, 49th Annual Meeting of the Highway Research Board, Washington, D.C. Jan 1970. 18 p, 1 fig, 4 tab, 10 ref.

Descriptors: *Tunnel design, *Supports, Tunnels, Excavation, Gunite, Economics, Deformation, Tunnel linings, Rock bolts, Stress-strain curves, Buckling, Disturbances, Tunneling, Tunnel construction.
Identifiers: *Tunnel supports, Rock breakage, Shotcrete, Illinois U.

Selection and design of the support system are 2 of many interrelated factors in the overall design of a serviceable and economical tunnel. The type of support, method of excavation, and character of the ground are inseparable considerations. Factors pertinent to good design of tunnel supports are: (1) types and functions of tunnel support systems; (2) types of primary support systems; (3) planning and design of tunnel support systems; (4) modern concepts of the design of tunnel support systems; (5) guidelines for selecting primary support systems for rock and soil tunnels; and (6) improvement in support systems for high-speed tunneling. Results of studies conducted at the University of Illinois on various aspects of design of support systems for transportation tunnels are described. (USBR)

SHIP-CANAL BANK PROTECTION,
Technische Hogeschool, Delft (Netherlands).
L. Van Bendegom, J. Bouwmeester, W. Bokhoven, P. Boer, and H. J. Span.
Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Sect 1, Subj 6, Inland Navigation, p 109-137, Paris, 1969. 29 p, 17 fig.

Descriptors: *Retaining walls, Construction materials, Costs, Navigable waters.

The protection of waterway banks must be considered as part of the general problem of the regulation of waterways at the lowest cost of construction and maintenance. Factors that influence the choice of revetment: level of water and its variations, position of the original water table and under pressures, eventual draining of the soil dimensions of the canal, dimensions and speeds of vessels and the importance of traffic. Several formulae are presented which permit the calculation of the thickness of the revetment and other important factors. Recent structures for bank protection are described. The article is written in English and includes a French summary. (Grossman-Rutgers)

PROTECTIVE REVETMENT OF RIVER EMBANKMENTS (IN FRENCH).
Giovanni Padoan, and Francesco Marzolo.
Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Sect 1, Subj, 6, Inland Navigation, p 77-85, Paris, 1969. 9 p.

Descriptors: *Retaining walls, *Concrete-lined canals, Bank erosion.
Identifiers: *Rugosity.

Canal revetments contribute to: conservation of the canal bed, to the impermeabilization of the canal bed, and to the reduction of bank rugosity. Efforts must be made to resist erosion due to the current and to the displacement of vessels; both factors increase with the speed of vessels and with propellor wash. It must be insured that the canal bed is waterproof if it traverses permeable ground and if the original water table is at a different level from that of the canal water. New revetments such as concrete cast in site, pre-fabricated slabs and bituminous revetments are now used in addition to former types of revetments. The article is written in French and contains an English summary. (Grossman-Rutgers)

ECONOMICS OF BANK PROTECTION ON CANALS AND NAVIGABLE RIVERS (IN FRENCH),
Service Technique de la Direction des Ports Maritimes et des Voies Navigables (France).
R Tenaud.
Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Sect 1, Subj 6, Inland Navigation, p 57-76, Paris, 1969. 20 p, 7 fig, 2 tab.

Descriptors: *Bank erosion, *Retaining walls, Navigable rivers, Concrete-lined canals, Navigation.
Identifiers: *Schyf formula.

The paper reviews the various factors which lead to the degradation of canal and navigable river banks. Tests carried out on scale models have shown that the amplitude of the first wave lifted at the front of the vessel is roughly double of the lowering indicated by the water level calculated by the Schyf formula. A review of the principal types of bank protection instituted in France is included. A few general rules on the use of various types of revetment are given. Protection against lapping can lead to more economical conclusions than a revetment over the entire height of the bank. The article is written in French and contains an English summary. FREE SURFACE, VELOCITY GRADIENT FLOW PAST HEMISPHERE,
Utah State Univ., Logan. Dept. of Hydraulic Engineering; Colorado State Univ., Fort Collins. Dept. of Civil Engineering; and North Dakota Univ., Grand Forks. Dept. of Civil Engineering.
Gordon H. Flammer, J. Paul Tullis, and Earl S. Mason.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY7, Paper 7418, p 1485-1502, July 1970. 18 p, 10 fig, 1 tab, 10 ref, append. NSF Grant GP-2618.

Descriptors: *Open channel flow, *Flow around objects, *Flow resistance, Hydraulics, Nonuniform flow, Unsteady flow, Hydraulic models, Laboratory tests, Fluid friction, Shear drag, Viscosity, Free surfaces.
Identifiers: Flow past hemispheres.

The drag on a hemisphere in a finite-flow field with free surface effects is evaluated by successively studying six flow fields, which allows the study of one new variable at a time. These flow fields are: the semi-infinite uniform and nonuniform flow fields, the finite uniform and nonuniform flow fields without free surface effects, and the finite uniform and nonuniform flow fields with free surface effects. Three regimes of flow are defined for the hemisphere which are: (1) A regime of pronounced free surface effects, (2) a regime of moderate free surface effects, and (3) a regime of negligible free surface effects. The effect of these variables and range of conditions under which they are effective is considered. (Knapp-USGS)

ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY7, Paper 7412, p 1455-1468 July 1970. 14 p, 8 fig, 2 tab, 9 ref, append.

Descriptors: *Computer programs, *Flow measurement, *Bridges, Hydraulic models, Hydraulics Open channel flow, Stage-discharge relations.
Identifiers: *U.S. Army Corps of Engineers, *Flow through bridges.

Techniques used for the computer determination of water surface profiles through bridge structures of various shapes and sizes, including culverts under high fills, are presented. Theoretical aspects of procedures using momentum principles are described in detail for both supercritical and subcritical flow. Methods for determining the controlling type of flow (low flow, pressure flow, weir flow, or various combinations of these) and corresponding changes in water surface elevation, are described and illustrated. Stress is placed on the need for additional research and field data to evaluate the accuracy of various techniques that are suited to computer determination of water surface profiles through bridges. Limitations of the procedures are described. (Knapp-USGS)

EFFICIENCY OF AIR-ENTRAINING VORTEX FORMATION AT WATER INTAKE,
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
Michael C. Quick.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY7, Paper 7399, p 1403-1416 July 1970. 14 p, 9 fig, 10 ref, append.

Descriptors: *Vortices, *Air entrainment, *Intakes, Bubbles, Hydraulics, Flow, Hydrodynamics Pumps, Open channel flow, Closed conduit flow Aeration, Mixing.
Identifiers: Air-entraining vortices.

The basic mechanisms for air-entraining vortices to form at a water intake are examined and vorticity arising in boundary layers is considered in detail. Theoretical expressions are developed for calculating the maximum strength of air-entraining vortex which may form at a water intake. Experiments confirm that it is possible to calculate the strength of vortex from a knowledge of approach conditions and intake geometry. For the conditions of these tests the efficiency of vortex formation is approximately unity. A kinetic energy evaluation for the approach flow and intake flow sections indicates the organizational nature of the process and gives values for the additional pressure losses at an intake which are attributable to vortex formation. CE Proceedings, Journal of the Hydraulics Divi-, Vol 96, No HY7, Paper 7427, p 1549-1565, 1970. 17 p, 9 fig, 3 tab, 17 ref, append.

criptors: *Air entrainment, *Turbulent flow, eration, *Open channel flow, *Air-water inter-es, Free surfaces, Boundary layers, Hydraulics. ntifiers: Self-aerated flow.

eption and entrainment of air in self-aerated n channel flows are studied. For inception to ur surface eddies should leave the free surface the whole fluid should be turbulent. A criterion the surface eddy to leave the free surface is for-ated using the energy concept. A method to ate the zone of boundary layer emergence to the surface which causes the whole fluid to be tur-ent in the case of flow over free overfall spill-s is developed. Using the concept of entrain-nt the basic equations for aerated flow down matic channels are formulated. Using these ations, several flow characteristics of the form aerated flow are studied. The investiga-ns help in computing uniform aerated flow racteristics knowing the nonaerated flow data. (Knapp-USGS)

PERIMENT ON AN EFFLUENT DISCHARG-G FROM A SLOT INTO STATIONARY OR OW MOVING FLUID OF GREATER DENSI-

draulics Research Station, Wallingford (En-nd).
D. Anwar.
rnal of Hydraulic Research, Vol 7, No 4, p 411-, 1969. 21 p, 8 fig, 8 ref.

criptors: *Mixing, *Dispersion, *Jets, *Con-tion, Density currents, Turbulent flow, Hydrau-models, Laboratory tests, Instrumentation, Dif-on.
ntifiers: Convection plumes.

periments were conducted in which fresh water discharged upward from a slot into a stationary slow-moving ambient fluid, a solution of salt er of uniform density. The density at points in plume was determined by measuring the con-tration of the salt solution using an electrical ductivity probe. The profiles of density, within range of experimental error, were of Gaussian n, close to those of a natural convection plume. theory of a convection plume over a finite rce was applied to evaluate the measured data. measured data agreed reasonably well with the oretical results when the origin of the plume was he height of the potential core, which was about e times the nozzle-width. THODS SYSTEMIZATION MANUAL: EPARATION OF HYDROLOGIC ENGINEER-G COMPUTER PROGRAMS.
ps of Engineers, Sacramento, Calif. Hydrologic ineering Center.

drologic Engineering Center of the Corps of En-eers, U.S. Army, U.S. Army Engineer District, remento, Calif, Jan 1970. 18 p, 2 exhibits.

criptors: *Computer programs, *Hydrologic ects, *Engineering, *Efficiencies, Testing, cumentation, Hydrographs.
ntifiers: Generalized computer programs, HEC.

purpose of the manual was to provide sug-ions for systemizing hydrologic engineering puter programs and to report on some pro-mming ideas developed in HEC and at various ps offices. Guidelines were designed to increase ciency of computer usage and to promote easy exchange of program routines among hydrologic engineers. The term 'generalized computer program' was adopted by the HEC as being descriptive of a kind of program which 'has application to most or all problems in a particular area of technology'. Other important aspects of the problem described were: testing, documentation, maintenance of up-to-date source decks, program distribution and assistance to users application of the programs to both simple and complex problems. An example of a highly flexible generalized program, the HEC 1 - Flood Hydrograph Package was given as an exam-ple. (Kriss-Cornell)

INITIAL SCOUR AND SEDIMENT MOTION DUE TO AN IMPINGING SUBMERGED JET,
Technion - Israel Inst. of Tech., Haifa.
M. Poreh, and E. Hefez.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11 - 14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C2, p 9-16, 1967. 8 p, 10 fig, 6 ref.

Descriptors: *Scour, *Sediment transport, *Jets, Turbulent flow, Non-uniform flow, Streambeds, Shear stress, Particle size, Channels, Forecasting, Viscosity, Specific weight.
Identifiers: *Scour and sediment movement, Submerged jets.

Sediment motion and scour caused by submerged jets are difficult problems to solve by theoretical analysis. An experimental approach to study the initial sediment motion uses a circular jet that impinges normally on a flat erodible bed. The entrainment region can be analyzed using a modified form of Shield's equation for the critical shear stress. Shield's analysis is based on the assumption that the beginning of the sediment motion in a given bed is related to a particular value of the critical shear stress. The submerged specific weight of the sediment, kinematic viscosity of the fluid, and diameter of sediment particles are parameters used to define the critical shear stress. The depth of the initial scour hole was almost zero near the stagnation point and reached a maximum depth near the point of maximum shear stress. Scour is initially limited to the region where the shear stress is larger than the critical shear stress. This region of entrainment in open channels can be theoretically predicted and practical measures can be taken to protect this region. (Carstea-USGS)

DETERMINATION OF THE DEPTH OF SCOUR AROUND AN OBSTRUCTION IN AN ALLUVIAL CHANNEL,
Central Water and Power Research Station, Poona (India).
Z. S. Tarapore.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C3, p 17-25, 1967. 9 p, 2 fig, 4 photo, 10 ref.

Descriptors: *Scour, *Alluvial channels, *Sediment transport, *Flow around objects, *Model studies, Hydraulic models, Shear stress, Sediment yield, Flow, Sediment load, Bridges, Piers, River beds, Dams, Cofferdams, Sedimentation rates.
Identifiers: *Limiting scour concept, Local scour.

Local scour occurs when the sediment transporting capacity of water at a given point is greater than the sediment supply. This situation can occur when the sediment load is removed or when there is a local increase in shear stress, which can be caused by the presence of an obstacle in the flow. A theoretical method is given for prediction of scour around an obstruction, such as a bridge pier. The concept of limiting scour is introduced; this means the condition of the scour hole where no further erosion or deposition takes place at any point of the river bed. The following assumptions are made: (1) The theory considers the initial flow patterns in the vicinity of the obstruction; (2) The velocity diffuses into the scour hole once the scour hole develops; (3) The bed material in the section of maximum velocity rests at the angle of repose; and (4) The rate of sediment transportation between streamlines is a constant. The theoretical method was applied to determine the depth of scour around a cofferdam to be constructed for the Captain Anthony Meldahl lock and dam. There was a good agreement between calculated and observed values. (Carstea-USGS)

French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper 68, p 65-73, 1967. 10 p, 4 fig.

Descriptors: *Scour, *Streambeds, *Weirs, *Stilling basins, Jets, Head loss, Tailwater, Flumes, Simulation analysis, Arpons, Engineering structures, Cavitation.
Identifiers: Stilling basin scour.

The energy at the base of the weir is dissipated by building a concrete apron downstream. Scour hole development and the feasibility of criteria for stone stilling basins are discussed. If drag forces of the nappe impingement exceed the existing forces, the scour hole begins to form. The drag force decreases as the hole deepens and as the velocity at the bottom of the plunging jet is reduced. The scour profile becomes stabilized when equilibrium is reached. The scour depth is a function of water head, weir length, tailwater depth, and stone properties such as size, size distribution, shape, and specific gravity. The scour depth will increase if either water head or weir height increases or as tailwater or mean stone size decreases. Flume experiments were conducted to establish relationships between the variables. The data are presented in dimensionless plots. The proposed design for building stone stilling basins was verified under a simulated natural hydrology and was found satisfactory for field use. Stone stilling basins are recommended over concrete basins because they are more economical and do not require highly skilled labor. (Carstea-USGS)

SCOUR BELOW SUBMERGED SOLID BUCKET-TYPE ENERGY DISSIPATORS,
Mysore Engineering Research Station, Krishnarajasagara (India).
D. Doddiah.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C13, p 105-116, 1967. 12 p, 11 fig, 1 tab, 7 ref.

Descriptors: *Scour, *Energy dissipation, *Stilling basins, *Roller gates, Engineering structures, Model studies, Flumes, Hydraulic models, Sediment transport.
Identifiers: *Submerged bucket-type energy dissipator, Scour zones, Solid roller.

The occurrence of scour below solid roller or submerged bucket energy dissipators is discussed. The submerged solid bucket is an effective energy dissipator but it requires very deep tailwater for good performance. It can be considered as a shorter stilling basin with a greater depth. The depth of scour decreases and the distance from the toe of the structure of maximum scour increases with an increase in the tailwater depth. A decrease in the radius increases scour. It appears to be no appreciable change as far as the flip action is considered. Zones of zero scour and flip action have been delineated. (Carstea-USGS)

SCOURS BEHIND STILLING BASINS WITH ENDSILLS OF BAFFLE-PIERS,
Technische Hochschule, Brunswick (West Germany).
Friedrich Zimmermann, and Ulrich Maniak.
French summary included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C14, p 117-124, 1967. 8 p, 5 fig, 4 ref.

Descriptors: *Stilling basins, *Scour, *Baffles, *Piers, *Sediment transport, Energy dissipation, Streams, Waterfalls, River beds, Model studies, Hydraulic models, Hydraulic jump, Roller gates, Control structures, Stream erosion.
Identifiers: Endsills, Baffle piers.

The rate of energy dissipation in stilling basins can be judged from the nature of scour in the movable bed of a river downstream from a stilling basin or a weir. Generally, weirs with small or medium waterfall do not require any bed protection. Large size scours should be prevented at stilling basins below weirs because they may endanger structural stability. Model tests were conducted using 8 types of endsills of baffle piers in order to determine their effect upon the movable river bed behind them. The results were compared with those obtained from a flat stilling basin without any energy dissipators. The dimension of scour was reduced by more than 50% by the baffle piers. The baffle piers contributed to the stable position of the surface roller within the stilling basin. The results of the model studies are confirmed by observations. (Carstea-USGS)

AN INTERESTING HYDRAULIC EFFECT OCCURRING AT LOCAL SCOUR,
Hydraulic Research Inst., Prague (Czechoslovakia).
Zdenek Thomas.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C15, p 125-134, 1967. 10 p, 10 fig.

Descriptors: *Scour, *Piers, *River beds, *Sediment transport, Flow around objects, Hydraulic properties, Slabs, Flow control, Erosion control.
Identifiers: *Scour at piers.

Experiments were conducted to study the effect of a horizontal shield upon the scour phenomenon at piers. The purpose of the shield was to prevent the vertical flow from reaching the river bed. A circular cylinder pier with a ring-shaped horizontal shield was used. Tests were conducted by using two shields placed at different heights above the bottom. The experimental results are expressed in dimensionless coordinates. The scour depth decreased considerably when the shield was used. Empirical equations relating the scour and the height of the shield above the bottom are given. The depth and the size of a scour can be considerably decreased by placing a thin horizontal slab near the bottom of piers. (Carstea-USGS)

EROSION EXPERIENCE DOWNSTREAM OF BED STABILIZATION AND WATER LEVEL CONTROL STRUCTURES,
Corps of Engineers, Omaha, Nebr.
Walter M. Linder.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C16, p 135-142, 1967. 8 p, 6 fig, 1 ref.

Descriptors: *Stream erosion, *Missouri River, *Control structures, *Scour, *Bank stabilization, Water levels, Tributaries, Meanders, Channels, Flood control, Levees, Drawdown, Model studies, Bank erosion, Alluvial channels, Erosion control.
Identifiers: *Rock sills, Bed stabilization.

Tributaries to the Missouri River meandered and scoured deep channels near their mouths in order to reduce the excessive gradient near the confluence. Construction of flood control works has provided enlarged and straightened channels and levees control the water surface elevation of high flows. Without some form of water level control a severe drawdown condition and high velocities would result in bed and bank erosion. Model tests were performed by using structures which consisted of rock sills at the mouth of the Little Sioux. The rock sills are flexible and can adjust to significant degrees of erosion that could ordinarily damage or destroy a conventional concrete structure. The rock sills should not be used as a critical depth control except for very low flows. They should be designed to operate under submerged conditions. Hydraulic model tests are important but only three-dimensional models can fully reveal the major sources of difficulty. A carefully designed and constructed rock structure can effectively control water level and prevent channel erosion. (Carstea-USGS)

EVOLUTION OF SCOUR DOWNSTREAM FROM A MOBILE BARRAGE RESTING ON INCOHERENT MATERIAL, AND SOME CONSIDERATIONS OF THE SCOUR MECHANISM,
State Hydraulic Works, Ankara (Turkey). Dept. of Research.
Turhan Acatay.
English summary included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C17, p 143-150, 1967. 8 p, 5 fig, 2 tab.

Descriptors: *Scour, *Streambeds, *Hydraulic structures, *Gates, Dams, Flow, Sediment load, Slopes, Dredging, Climatic data, Sediment transport, Agricultural watersheds, Hydraulic gates, Sedimentation, Deposition (Sediments).
Identifiers: *Scour near dams.

Local scour at Boceli small dam was investigated. The gates were closed and opened in three different ways and the effects on local scour were measured. A rapid occurrence of local scour was observed in the region with a strong flow and a high velocity. Sediment load increased considerably due to agricultural use of the upper areas with steep slopes. As a result, the bottom around the dam rose 1.70 m. About 3500 cu m were dredged from an area of 50 sq m in order to bring the bottom to the normal level. The changes in climate conditions and other natural factors in the watershed are important in designing the hydraulic works. (Carstea-USGS)

S. K. Sharma.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C19, p 162-168, 1967. 7 p, 3 fig, 4 ref.

Descriptors: *Stream erosion, *Porous media, *Underseepage, *Weirs, Friction, Cohesion, Flotation, Design criteria, Slopes, Streambeds, Seepage, Model studies, Tension, Gravity, Sediment transport.
Identifiers: *Flotation gradients.

The two major assumptions made during the design of weirs on permeable foundations are: (1) The downstream bed is horizontal and (2) the porous material of the bed is devoid of friction and cohesion. However, these assumptions do not hold in nature. The criteria for testing the stability of sloping beds subject to seepage were considered for noncohesive and cohesive bed materials. The generalized equations for exit of critical gradients and factor of safety were derived from model studies. In the case of noncohesive material, a particle will be lifted up when the seepage force exceeds a value just sufficient to balance the submerged weight. In the case of cohesive material, the soil

rticle will be lifted up when the seepage forces ting upward normal to the soil slope exceed the m of the gravitational and tension forces acting rmal to the slope in the downward direction. arstea-USGS)

entifiers: *Streambed erosion, Scour around a linder.

laboratory study of local scour around a circular linder placed in open channel flow indicated that al bed materials were transported by vortex flow curring at the front foot of the cylinder. The vor-x is generated by a combination of main flow at e upper stream portion of the cylinder and poten-l flow in the downward direction along the front rface of the cylinder. The size of the local scour is ated to strength and size of the vortex flow. The rtex flow could be controlled by hydraulic ethods such as holes drilled through the cylinder putting an interceptor around the cylinder sur-ce. The size and position of the hole or intercep-r were determined mainly by flume experiments. ch methods could also be applied to prevention local scour at the front bed of vertical walls in en channel flow. entifiers: *Wall jet theory, Submerged culverts.

osion at the outlet of submerged culverts was stu-ed experimentally and theoretically. Shear esses at the inception of erosion were deter-ned by using secondary layer theory for wall jets, based on critical pipe velocities which initiated erosion. The critical tractive stress concept of open channel flow was found applicable to submerged jets. If the tailwater covers the top of the outlet pipe, the magnitudes of the critical exit velocity and the critical bed shearing stress are independent of the amount of submergence over the top of the outlet. The boundary layer theory can be used to predict the shearing stress along the bed and the length of protective aprons that might be required. (Carstea-USGS)

THE SCOURING ENERGY OF THE MACROTURBULENT FLOW DOWNSTREAM OF A HYDRAULIC JUMP,
Technische Hochschule, Munich (West Germany). Hydraulics Research Station, Obenach.
Fritz Hartung, and Klausotto Csallner.
French summary included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C27, p 227-237, 1967. 11 p, 4 fig, 2 ref.

Descriptors: *Scour, *Turbulence, *Flow, *Hydraulic jump, Flow around objects, Streams, Model studies, Tractive forces, Hydraulic models, Hydraulic structures, Energy dissipation, Froude number.
Identifiers: Macroturbulent flow, *Scouring energy.

In order to obtain estimates of the range of magnitude and the distribution of the neglected macroturbulent energy in hydraulic jumps it was necessary to conduct model tests. In these tests the turbulence energy was observed indirectly by its effects on tractive force and scouring. Its order of magnitude was obtained theoretically by applying the Meyer-Peter formula for the beginning of tractive force action. Relative energy dissipation is a function of the Froude number. The energy dissipation due to the hydraulic jump is considerably smaller than estimated by means of the conventional two-dimensional analysis. The remaining surplus energy head decreases downstream of the hydraulic jump according to an exponential function. (Carstea-USGS)

SOME HYDRAULIC CHARACTERISTICS OF TRAPEZOIDAL DROP STRUCTURES,
Alabama Univ., Huntsville. Dept. of Fluid Mechanics; and Federal Power Commission, Washington, D.C.
Cornelius C. Shih, and Donald F. Parsons.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C29, p 249-259, 1967. 11 p, 10 fig, 9 ref.

Descriptors: *Hydraulic properties, *Drops (Structures), *Weirs, Flow, Steady flow, Discharge (Water), Dimensional analysis, Channel morphology, Streambeds, Model studies, Hydraulic models, Vortices, Turbulence.
Identifiers: *Trapezoidal drop structures.

This study is concerned with some of the hydraulic characteristics of flow over drop structures connecting two trapezoidal channels at different elevations. The drop structures are formed by an abrupt drop in the horizontal channel bottom, and are equipped with or without a weir. The relationships among the quantities pertinent to the hydraulic characteristics are investigated through dimensional and experimental analyses. The dimensional analysis which was based on theoretical consideration of the flow problem, resulted in a set of dimensionless parameters, namely the relative depth, the drop number, and geometric parameters of the drop structure. Experimental results are presented in graphical form through dimensionless parameters for various trapezoidal drop structures. Some typical flow phenomena are shown in photographs. (Carstea-USGS)

French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C33, p 283-291, 1967. 9 p, 2 fig, 2 tab, 3 ref.

Descriptors: *Stream erosion, *Hydrographs, *Floods, *Streambeds, Hydraulic models, Steady flow, Unsteady flow, Cohesionless soils, Streams, Velocity, Backwater, Runoff, Discharge (Water).
Identifiers: *Artificial streambeds, Constricted flow, Lopasnya River, USSR.

The erosion of artificial streambeds was studied in hydraulic models under uniform and nonuniform flow conditions. The deformation occurring in a noncohesive bed material under steady flow was compared with that obtained with unsteady flow and with constricted streambed. Experiments in natural conditions were conducted on the small Lopasnya River near Moscow. As a result of stream constriction, the velocities became redistributed in depth and width. At the beginning of the experiments, there was a visible leveling off of longitudinal velocities along a vertical line. The relationships between the backwater before the flow constriction and the form of floodwater hydrograph are given. It was concluded that in order to compute the deformation of a constricted channel, the maximum floodwater discharge, shape of the hydrograph, duration of floodwater and the volume of the runoff should be known. (Carstea-USGS)

O. P. Gupta, S. N. Gupta, and P. N. Saxena.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C34, p 292-302, 1967. 11 p, 10 fig, 1 ref.

Descriptors: *Scour, *Control structures, *Alluvial channels, *Floods, Hydrographs, Streams, Weirs, Boulders, Particle size, Slope stability, Energy dissipation, Streambeds, Stream erosion, Sediment transport, Channel morphology.
Identifiers: India, Ganga River.

Over one hundred years of data are presented to depict regimes of the boulder stage of the Ganga River and of the alluvial Ratmau torrent, India. A weir across the Ganga River reduced the upstream bed slope of the river from 10 ft/mile to 8 ft/mile, while the downstream slope remained unaffected for 45 years of operation. In the Ratmau torrent, the upstream slope of 8.23 ft/mile remained unchanged during 120 years of operation of the escape regulator while the downstream bed was lowered by 25 ft immediately below the control, and slope flattened to 4.15 ft/mile. A dentated sill at the downstream floor of the undersluices on the Ganga was not only effective in controlling bed scour but withstood the onslaught of moving boulders 30 cm and greater diameter. Energy dissipators at the downstream floor of the escape regulator at Ratmau controlled the bed scour immediately below it but retrogression continues in the entire 9 1/4 miles length of the torrent. RIVER BED SCOUR AT BRIDGE CONSTRICTIONS,
Central Water and Power Research Station, Poona (India).
C. V. Gole, and S. V. Chitale.
French resume included. Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C38, p 330-337, 1967. 8 p, 5 fig, 7 ref.

Descriptors: *Scour, *Bridges, *Floods, *Engineering structures, Hydrographs, Hydrograph analysis, Rivers, Structural stability, Safety, Streambeds, Sediment transport.
Identifiers: *Scour at bridges, Constrictions.

Measurements of bed scour were made at Mokameh bridge on the Ganga River and on the Luni River at Samdari in Rajasthan, India. The rates of bed scour at these bridges were considered in relation to the flood hydrographs of the rivers. In the case of flash floods, the rate of water level rise is fast, and is not sufficient to produce scour at the bridge constriction. For structure safety on flashy rivers, the constriction should be designed to allow more waterway than is normally provided in rivers carrying sustained floods. In the case of rivers with gradual rise and fall of water (Ganga River), constrictions could be narrower because the reduction in width is compensated by an increase in depth due to bed scour. In contrast to the flashy river, the limiting depth of scour in rivers with gradual rise of water is reached by the time of the peak floods. (Carstea-USGS)

THE STUDY OF THE SCOURS BEHIND A SPILLWAY, (IN FRENCH),
Jose Colaric, E. Pichon, and Fabien Sananes.
Proceedings 12th Congress of the International Association for Hydraulic Research, Sept 11-14, 1967, Colorado State Univ, Fort Collins, Vol 3 (Erosion and local scour downstream from hydraulic structures), Paper C37, p 322-329, 1967. 8 p, 7 fig.

Descriptors: *Scour, *Spillways, *Sediment transport, *Hydraulic models, Model studies, Specific weight, Particle size, Flow, Hydraulic properties, Sands, Stream erosion, Streambeds, Pressure drag, Velocity, Engineering structures.
Identifiers: *Erosion processes, Streambed scour, Sill.

The principal results of a joint research program at the Hydraulic Laboratory of Ljubljana, Yugoslavia, and the Laboratory of I.M.F.T., Toulouse, France, are summarized. The relations between hydraulic parameters such as depth of the scour, flow, chute, length and height of the flat sill, diameter and specific weight of the sand were studied at Ljubljana. At Toulouse many experiments were conducted on the scouring processes. The critical velocity of the grains dragging on the mobile bed and the pressure fluctuations were shown to be important in scouring processes. (Carstea-USGS)

AIR ADMISSION AND FLOW AERATION IN HYDROTURBINES,
N. K. Barkov.
Elektricheskie Stantsii, No 8, p 26-29, 1968. Transl from Russian by Bureau of Reclamation, Trans No 635, Mar 1970. 17 p, 6 fig, 12 ref.

Descriptors: Foreign research, Hydraulic machinery, Surges, *Aeration, Turbine runners, *Air, Francis turbines, Kaplan turbines, Abrasion, Flow separation, Water hammer, Cavitation, Vacuum, Velocity distribution, Vibrations, *Compressed air, Fluid flow, Guide vanes, Draft tubes, Flow control, Erosion, Hydraulic design, *Hydraulic turbines, Bubbles.
Identifiers: USSR, Krasnoiarsk Powerplant USSR, *Cavitation control, *Air admission, Flow patterns, Turbine efficiency.

Various methods of atmospheric and compressed air admission in hydraulic turbines are described. Presently, atmospheric air is used successfully in hydraulic turbines for (1) filling the breaks in flow continuity, (2) preventing erratic conditions and dangerous vibration during periods of abnormal flow whirling in the draft tube, and (3) stabilizing flow for partial loading and off-design head operation. Compressed air injection is accomplished by several techniques and practical devices. Compressed air is used to reduce erosibe wear in hydraulic turbines caused by cavitation. Research shows that air in flow cavities lowers significantly the rate of cavitation damage and is highly effective in controlling pressure surging beyond the turbine runner. Futher study of air injection is required to improve the reliability and operation of contemporary hydromachines. (USBR)

THE RESISTIVITY OF INSULATING OIL IN A DIRECT-VOLTAGE FIELD,
Brown, Boveri and Co. Ltd., Baden (Switzerland).
B. Ganger, and G. Maier.
Brown Boveri Review, Vol 56, No 10, p 525-533, Oct 1969. 9 p, Fig, 9 ref, append.

Descriptors: *Transformer oils, *Resistivity, *Direct current, Extra high voltage, Electric potential, Transmission (Electrical), Electrons, Conductivity, Electric insulation, *Dielectrics, Resistance, Laboratory tests, Temperature, Electric fields, Impurities.
Identifiers: *Insulating oil, Space charge, Test results, Switzerland, Foreign testing.

Insulating oil and oil-impregnated paper in various forms are the principal materials for insulating equipment found in the rectifier and inverter stations of hydro transmission systems. Depending on function and location, insulation is subjected either to a straightforward d-c voltage, or to a combination of d-c voltage and a complex a-c voltage. With an electrical series arrangement consisting of one or more layers of solid insulating materials with oil-filled gaps in between, the partial voltage applied to each dielectric, in the case of d-c voltage, is solely dependent on the d-c conductances of individual materials. This conductance is defined as the ratio of leakage current to applied partial voltage. The current may also include proportions of a strongly time-dependent absorption current. Voltage distribution depends on the properties of the insulating materials used. Resistivity of new and aged transformer oil in relation to field strength was investigated almost to breakdown while varying the temperature, duration of the stress, and flow velocity. Conductivity of aged oil follows simple laws, owing to higher ion concentration, but certain anomalies are found with new oil, such as a maximum resistivity of 1 to 2 kv/mm, which can probably be attributed to space charge effects. SUPERCRITICAL BOILER UNITS, NOW IN THEIR THIRD GENERATION, GAIN TIGHTER GRIP,
Association of Electrical Engineers of the Montefiore Inst., Liege (Belgium).
Rene J. Bender.
Power, Vol 114, No 5, p 30-32, May 1970. 4 fig, 1 tab.

Descriptors: *Economic prediction, *Water pressure, Boilers, Boiler feed water, Efficiencies, Coals, Thermal pollution.
Identifiers: *Supercritical pressure, Subcritical pressure, Heat rate.

A review was made of the supercritical pressure situation to date. The first supercritical pressure boiler was built 14 years ago. Now, there are over 140 supercritical pressure units either operating, under construction, or on order in the U.S., Japan and Europe. The savings on these units go hand in hand with their efficiency. They will depend on the amount of fuel burned per year, the load factor, and the cost of fuel. Operating figures showed that the average overall heat rate for a 2400-psig plant is estimated at 9000 Btu/kWh, compared to 8860 Btu/kWh for a 3500-psig plant. This is a saving of 140 Btu/kWh or 1.6%. Further, when fuel costs are high, a supercritical operation is more economical. When fuel costs are low, a subcritical operation is more economical. The past headaches of supercritical pressure units included: (1) fouling of superheater and reheater elements; (2) leaks in the feedwater heaters; (3) starting valve leaks; (4) starting procedure; and (5) treatment of the feedwater. These problems have mostly been solved. Supercritical boiler units promise to be an important tool of the future. (Osborne-Vanderbilt)

E OF EXPLOSIVE METHODS TO COMPACT IL DURING CONSTRUCTION OF IRRIGA-ON CANALS,
A. Vovk, G. I. Chernyi, and B. G. Kravets.
Irotekhnika i Melioratsiya, No 7, p 82-87, 1969.

scriptors: Foreign research, *Explosions, Explo-es, Canal seepage, Soil mechanics, *Soil com-tion, *Irrigation canals, Loess, Test holes, nesive soils, Moisture content, Seepage losses, ined canals, *Canal construction, Methodolo- Ponding tests, Test pits, Construction, Cost nparisons, Soil density, Testing Permeability.
ntifiers: USSR, Explosive excavation, *Con-ction methods, Rapid excavation, *Explosive struction, *Seepage control.

eral Ukrainian institutes conducted tests on g explosions for compacting soils to control page. A new method was developed using izontal cylindrical charges instead of concen-ed vertical charges. The method provided ater depth of compaction, less development of cracks around the crater, and a truer cross sec-n, reducing finishing work. The method was ed in clayey loams and loessial soils under con-ons similar to those encountered in building als in the Ukraine. Seepage was measured for 2 nths and again after one year by refilling craters y and allowing for evaporation losses. Density moisture content were measured by neutron gamma-gamma counting in special test holes. nstruction of irrigation canals in cohesive soils explosive methods is technically and economi-y sound; compaction is attained 2 to 3 m ond the canal perimeter. Construction time and of earth-moving equipment can be reduced atly. The new explosive construction technology reduce seepage by 12 to 14 times; conventional losive methods will reduce seepage by 4 to 6 es. (USBR)

TION OF HORIZONTAL TO VERTICAL RESSES FOR GRAVELS,
eau of Reclamation, Denver, Colo.
lard Ellis, and R.R. Ledzian.
port, 7th International Conference of Soil chanics and Foundation Engineering, Mexico , Mexico, p 69-77, Aug 1969. 9 p, 2 fig, 2 tab, 6

scriptors: *Gravels, Stress, *Poisson ratio, rth pressure, Soils, Soil engineering, Soil chanics, Soil properties, Strain, Axial strain, Soil s, Lateral forces, Vertical loads, Settlement uctural), Laboratory tests, Effective stress.
ntifiers: *Deformation modulus, *At rest pres-e, Soil modulus, Triaxial tests, Triaxial test mber.

ratio of horizontal to vertical stresses in all s is a subject of increasing interest in soil chanics because of the parameters needed to the new methods of analysis, particularly the te element procedures. The parameters needed Poisson's ratio and modulus of deformation. A hod of studying the ratio is to perform triaxial s holding lateral strain to zero; as the vertical ss is increased, any tendency for lateral defor-ion is resisted by an increase in chamber pres-e. The procedure is referred to as a K sub o test, ub o being the notation for coefficient of earth ssure at rest. Two gravels with a maximum parti-size of 3 in. were studied. Gravel A was poorly ded and free draining, and Gravel B contained siderable silty and clayey fines and was relative-mpervious. Each gravel was tested at 2 gravel tents, 50 and 65%. The specimen size for all s was 6 in. in diameter by 15 in. high. The tests e conducted under chamber pressures varying n zero to 1000 psi. The K sub o values for both vels and gravel contents were in the range of 0.2 .4. The values of Poisson's ratio were the same all tests, ranging from about 0.15 to 0.30. The ues of modulus of deformation increased with easing effective stresses. (USBR)

OBSERVATIONS ON PORE PRESSURES BENEATH THE ASH LAGOON EMBANKMENTS AT FIDDLER'S FERRY POWER STATION,
Alberta Univ., Edmonton.
Z. A. Al-Dhahir, M. F. Kennard, and N. R. Morgenstern.
Paper 20, Conference on In-situ Investigations of Soils and Rocks, Institute of Civil Engineers, p 175-186, May 1969. 12 p, 10 fig, 1 tab, 11 ref.

Descriptors: *Pore pressure, Pore water pressures, *Embankments, Soil consolidation tests, *Earth dams, *Consolidation, Coefficients, Field tests, *Permeability, Dam foundations, Soil engineering, Soil mechanics, Piezometers, Instrumentation, Foreign research, Soil tests, Laboratory tests, Soil properties, Displacements, Settlement (Structural).
Identifiers: Embedded instruments, Permeability coefficients, Great Britain, Permeability tests, *In situ tests, Dam stability.

Fiddler's Ferry Power Station in Great Britain involved the construction of ash disposal lagoons, formed by 35-ft-high embankments, 13,500 ft long, on marsh ground adjacent to the River Mersey. The foundation for the embankments consisted of soft clay overlying peat and sand and was instrumented with piezometers. Results of observations over 5 yr are given. In situ constant heat tests were performed on 3 separate occasions at the site to obrain coefficients of consolidation and permeability and their variation with changes in effective stress. Laboratory tests underestimate the coefficients found from the tests and from the field dissipation records. Reasons for the discrepancies are given. Instability associated with a sudden rise in pore pressure was observed and is discussed. (USBR)

8E. Rock Mechanics and Geology

SHEAR AND SLIDING RESISTANCE TESTS OF ROCK JOINTS FOR FOREBAY DAM-GRAND COULEE THIRD POWERPLANT PROJECT,
Bureau of Reclamation, Denver, Colo.
M. L. Haverland, and G. L. Butler.
Bureau of Reclamation Report REC-OCE-70-6, Jan 1970. 28 p, 28 fig, 4 tab.

Descriptors: *Rock foundations, Strength, *Shear strength, Laboratory tests, Field tests, Grand Coulee Dam, Faults (Geology), Test procedures, *Shear tests, Rock mechanics, Foundation investigations, Granites, *Shear reistance, Cohesion, Friction, *Joints (Geology).
Identifiers: Sliding friction, *Sliding resistance, *Sliding tests, In situ tests, Rock tests, Grand Coulee Powerplant, Wash.

Shear and sliding resistance tests were conducted in the Bureau of Reclamation laboratory and at Grand Coulee Dam, Wash, on 15- by 15- by 8-in. rock blocks to determine the apparent cohesion and sliding resistance of rock joints in the area of the Forebay Dam for the Third Power-plant. Laboratory tests utilized the 5-million-pound testing machine for the normal load and a 200-ton ram for the sliding (shearing) load. The in situ tests used a cable tensioned by a 60-ton ram for a normal load and another 60-ton ram for the sliding load. Movements were measured using displacement transducers and were recorded continuously on X-Y recorders. (USBR)

NON-LINEAR STRESS-STRAIN RELATIONS FOR A HOMEGENEOUS SANDSTONE,
Imperial Coll. of Science and Technology, London (England).
N. R. Morgenstern, and A. L. Tamuly Phukan.
International Journal of Rock Mechanics and Mining Science, Vol 6, p 127-142, 1969. 16 p, 16 fig, 15 ref.

Descriptors: *Sandstones, *Stress-strain curves, Triaxial compression, Mechanical properties, Deformation, Bibliographies, *Rock properties, *Rock mechanics, Strength of materials, Elasticity (Mechanical), Elastic theory, Rock foundations, *Cpmpressibility, Compression curves, Strain, Porosity, Compressive strength.
Identifiers: Triaxial tests, Foreign testing, Great Britain, Rock tests, Bulk modulus, Hysteresis loops, *Rigidity modulus.

Triaxial compression tests on a homogeneous sandstone showed nonlinear deformation, hysteresis on cyclic loading, and an irrecoverable strain on complete unloading. These properties were increased by an increase in porosity and by wetting. The sandstone has a porosity ranging from 10.0 to 16.6%. The triaxial tests were performed at confining pressures of 0, 150, and 500 psi. The nonlinearity of compressibility was greater than that of the modulus of rigidity. For specimens of a given porosity, the variation of compressibility with the sum of principal stresses was independent of loading path. Compressibility changes linearly with the logarithm of the sum of principal stresses until the value for the compressibility of quartz is reached; compressibility then remains constant. This point is reached at a unique value and is independent of porosity. At this stress level, compressibility of the sandstone is the same as quartz but the modulus of rigidity is only about one-tenth that of quartz. The simplest stress-strain relationship for describing the behavior of sandstone is one in which the modulus of rigidity remains constant, and only the modulus of compressibility varies with the average principal stress. (USBR)

THE NUMBER OF TEST-PIECES REQUIRED TO DETERMINE THE STRENGTH OF ROCK,
Tokyo Univ. (Japan).
U. Yamaguchi.
International Journal of Rock Mechanics and Mining Science, Vol 7, No 2, p 209-227, Mar 1970. 19 p, 26 fig, 5 tab, 3 ref, append.

Descriptors: *Rock properties, *Rock mechanics, Rocks, Mechanical properties, *Compressive strength, *Tensile strength, Statistical analysis, *Statistical methods, Statistics, Samples, *Sampling, Splitting tensile strength, *Test specimens, Test procedures.
Identifiers: Foreign testing, Japan, *Rock tests, Test results.

Investigators studying the mechanical properties of rock often find a wide scattering of values in the measurement of rock strength. Statistical procedures are useful to treat such scattered values and to compare the results. To test the validity of the statistical performance, every test specimen must be taken at random from the whole sample and enough specimens should be prepared to show the inherent probability distribution of the property of the sample. This poses the problem of how many test samples are required and how to make them. A technique from mathematical statistics is applied to several rock types to determine the number of test specimens. Compressive and tensile strengths were determined on granite, andesite, and sandy tuff, which are typical of hard, medium hard, and soft rock. As a general conclusion, 10 or more specimens are required to determine the strength of a rock, even if all specimens are prepared from the same block of rock. (USBR)

8F. Concrete

EFFECT OF STRESS LEVEL ON CREEP AND CREEP RECOVERY OF LEAN MASS CONCRETE,
Bureau of Reclamation, Denver, Colo.

K. B. Hickey.
Bureau of Reclamation Report REC-OCE-69-6, Dec 1969. 12 p, 7 fig, 4 tab, 12 ref.

Descriptors: *Creep, *Elasticity (Mechanical), *Mass concrete, Stress, Concrete technology, Laboratory tests, Deformation, Concretes, Recovery, Concrete testing, Compressive strength.
Identifiers: Concrete properties, Sustained loads, Compressive stress, *Creep tests, Test results, *Creep recovery.

A test program was conducted to investigate the relationship between the intensity of sustained load and the creep of a typical mass concrete with low cement content similar to that used in concrete dams. Sets of sealed mass concrete cylinders were loaded initially in compression at ages of 28 and 90 days; the loads were sustained for over a year and creep was measured periodically. Creep of concrete loaded at 28 days is proportional to sustained stress only up to 15% of the 28-day compressive strength. Increases in creep deformations are noted at stresses greater than 15%. Concrete loaded at 90 days exhibits creep proportional to sustained stress up to 22% of the 90-day compressive strength. Creep recoveries of sealed concrete specimens unloaded after 400 days of continuous compression are proportional to sustained stress, regardless of the concrete age at load application. (USBR)
W70-07871

ANALYSIS OF SHRINKAGE EFFECTS ON REINFORCED CONCRETE STRUCTURAL MEMBERS,
University Coll., London (England); and Cement and Concrete Association, London (England).
Robert H. Elevery, and Muhamed Shafi.
Journal of the American Concrete Institute, Proceedings, Vol 67, No 1, p 45-52, Jan 1970. 8 p, 9 fig, 1 tab, 19 ref, append.

Descriptors: *Shrinkage, Concrete structures, *Reinforced concrete, Structural behavior, Structural design, *Structural members, Stress, Strain, Theoretical analysis, Analysis, Beams (Structural), Creep, Deformation, Deflection, Equations, Testing, Test procedures, Effects, Bibliographies, Foreign research.
Identifiers: Concrete properties, Concrete slabs, Warpage, *Analytical method, Great Britain.

Concrete shrinkage often causes considerable deformation and stress changes in concrete structures; these changes are usually of sufficient importance to require attention at the design stage. A theoretical method for predicting stresses and deformations caused by concrete shrinkage is presented. Predictions of the warping behavior of reinforced-concrete beams using the method show good agreement with experimental results, particularly in the case of singly reinforced beams in which warping is most severe. Testing to verify the method is described. Previous studies of the effects of concrete shrinkage on reinforced concrete members are discussed. (USBR)
W70-07873

ALUMINUM PIPE: SOURCE OF CONCRETE-PUMPING PROBLEMS.

Concrete Construction, Vol 15, No 1 and 3, p 12-13; 94-96, Jan, Mar 1970. 5 p.

Descriptors: Low alkali cement, *Portland cements, *Pumped concrete, *Aluminum, *Pipes, Hydrogen, Concrete construction, Coarse aggregates, Aggregates, *Concrete mixes, Concretes, *Concrete technology, *Concrete placing, Bubbles, Voids, Air entrainment.
Identifiers: Concrete properties, Recommendations.

Under certain conditions, concrete pumped through aluminum pipe has exhibited serious deficiencies, including reduction in compressive strength by about 50%, expansion of freshly molded test cylinders, placement difficulties, and problems in maintaining grade after placement. Investigations show that the alkalies in cement are capable of reacting with aluminum, generating hydrogen gas that may leave voids in the hardened concrete. One report mentioned bubbles bursting at the concrete surface that could be ignited. Recommendations are made that aluminum pumplines should not be used when: (1) the coarse aggregate is quite abrasive, (2) nonuniformly graded sand is used, (3) the mix is low-slump, (4) a high-alkali cement is used, (5) a low sand-aggregate is employed, or (6) no air is entrained in the concrete. 8G. Materials

CAUSES AND PREVENTION OF COATINGS FAILURES,
National Association of Corrosion Engineers, Houston, Tex.
A. K. Long.
Material Protection, Vol 9, No 3, p 32-36, Mar 1970. 5 p.

Descriptors: *Corrosion control, *Protective coatings, *Painting, Paints, Primers (Painting), Failures, Inspection, Specifications, Steel, Maintenance, Chalking, Cracking, Chemical degradation, Deterioration, Chemical stability, Degradation, *Metal coatings, Steel structures.
Identifiers: Checking, Peeling, Delamination, Rusting, Blistering, Wrinkles, *Surface preparation.

This report discusses the failure of barrier-type protective coatings applied to steel surfaces, but does not include sacrificial-type zinc-rich coatings. Coating failures may be associated with the coating itself, application of the coating, or surface preparation. Ten common types of failures are: (1) chalking; (2) color fading or color change; (3) cracking, checking, and alligatoring; (4) peeling, flaking, and delamination; (5) rusting; (6) blistering; (7) lifting and wrinkling; (8) failures from chemical or solvent attack; (9) failure around weld areas; and (10) edge failures. Remedies and methods for preventing each type of failure are given. Past experience indicates that about 70% of all coating failures result from poor surface preparation. Although the blame is placed on surface preparation, the more realistic cause may be lack of proper specifications or inadequate inspection necessary to obtain the desired results. (USBR)

FIBROUS POLYMERS,
University of Strathclyde, Glasgow (Scotland).
R. Meredith.
Contemporary Physics, Vol 11, No 1, p 43-58, Jan 1970. 16 p, 8 fig, 1 plate, 3 tab, 7 ref.

Descriptors: *Fibers, *Synthetic fibers, *Polymers, Polyethylenes, Molecular structure, Cellulose, Proteins, X-ray diffraction, Reviews, Thermal properties, Mechanical properties, Electrical properties, Rheology, Viscosity, *Materials, Foreign research.
Identifiers: Great Britain, Synthetic resins, Vinyl resins, Acrylic resins, Polypropylene, Polyamides, Polyesters.

The molecular structure and physical properties of fibrous polymers are described and examples are given of the relations between them. Most fibrous material consists of long-chain molecules of carbon, hydrogen, oxygen, and nitrogen alined more or less parallel to each other. The most common molecular structures, the sequences of molecular building units, and cohesive forces that bind the molecules together are discussed; physical methods for investigating these structures are included. Special emphasis is given to mechanical properties and the application of mechanical vibrations for separating elastic and viscous responses. Rheological, thermal, and electrical properties and the improvement of these properties by grafting and copolymerization are covered. Some interesting uses and future developments are given. (USBR)

EXPERIENCE IN CONSTRUCTION OF POLYETHYLENE - CANALS,
V. A. Akopov.
Gidrotekhnika i Melioratsiya, No 4, p 35-39, 1969. Transl from Russian by the Bureau of Reclamation, Trans 833, April 1970. 12 p, 6 fig.

Descriptors: *Buried membranes, Canals, Foreign construction, Canal embankments, *Canal linings, Canal seepage, Cost comparisons, Blankets, Soil compaction, Impervious linings, *Polyethylenes, Canal design, Earth handling equipment, Economics, Joints (Connections), Foreign projects, Construction materials.
Identifiers: USSR, Turkmen SSR, Polyvinyl chloride, Seepage control, Construction methods.

Several Turkmen SSR design and construction organizations developed a trench method for installing buried membrane linings in canals to prevent seepage. Using this method to install a buried polyethylene lining in a large canal in desert soil with a 40-cu m/sec discharge was basically successful but not without difficulty. The canal had an 8-m-wide bottom and 2:1 side slopes. The trench had a 22-m-wide bottom 1 m below canal grade and 0.5:1 side slopes. Herbicide was applied before lining placement. The membrane, fabricated in 2 pieces by seaming smaller sheets with a household electric iron, was laid loosely on the trench surface and seamed along the canal centerline. Earth cover was placed on the bottom, spread by bulldozers, and compacted by rubber-tired rollers immediately after membrane placement to prevent ballooning of the lining. The remaining cover material was placed in layers and compacted. Compaction of the side-slope cover was difficult because of the small working area. About a fifth of the side-slope cover sloughed in during first-year operation and was replaced; little additional sloughing occurred after saturation. Total cost was 2.98 rubles/sq m of installed lining. More extensive use of PVC linings will depend on service life and property changes. (USBR)

SPRINKLER IRRIGATION--A BIBLIOGRAPHY SELECTED FROM FOREIGN LITERATURE,
Department of the Interior, Washington, D.C.
Ludmilla Floss.
Bibilography Series, No 15, Office of Library Services, Washington, D.C. Feb 1970. 54 p, 251 ref.

Descriptors: *Sprinkler irrigation, *Bibliographies, Foreign research, Foreign countries, Foreign design practices, Irrigation practices, Costs.

A bibliography of 251 references was compiled in response to many requests for recent foreign documents on sprinkler irrigation as distinguished from the domestic literature which can be obtained through normal sources. Modern sprinkler irrigation has revolutionized conventional procedures and is rapidly assuming an important place in many parts of the globe. The world demand for sprinkling equipment has grown to such great proportions that advanced studies in perfecting constructional solutions of such equipment are underway. Included in the bibliography are references to costs and economy of operation, equipment and systems of installation, and stationary and mobile methods of sprinkler irrigation; agricultural aspects have not been included. The references listed, with only a few exceptions, are from 1964 through summer 1969. The format is by country of publication, with an index of authors and names of organizations and government bodies concerned. A list of abbreviations used in the citations follows the bibliography. ENTRAINMENT
NUMERICAL ANALYSIS OF DISTRIBUTION OF FLOW AND THERMAL
DIFFUSION CAUSED BY OUTFALL OF COOLING WATER,
W70-08131 05B

ENVIRONMENT
THINKING SOCIAL-SCIENTIFICALLY ABOUT ENVIRONMENTAL QUALITY,
W70-07988 06B

AUTHORITY AND RESPONSIBILITY FOR ENVIRONMENTAL
ADMINISTRATION,
W70-07990 06E

THE TECHNOLOGICAL IMPERATIVE--SOCIAL IMPLICATIONS OF
PROFESSIONAL TECHNOLOGY,
W70-07991 06B

THE ENVIRONMENTAL DISPOSITIONS OF ENVIRONMENTAL DECISION-
MAKERS,
W70-07993 06G

ENVIRONMENTAL ADMINISTRATION
AUTHORITY AND RESPONSIBILITY FOR ENVIRONMENTAL
ADMINISTRATION,
W70-07990 06E

ENVIRONMENTAL CONDITIONS
RELATION BETWEEN ENVIRONMENTAL CHARACTERISTICS OF WATERS AND
CHANGES OF PHYTOPLANKTON IN AN ESTUARY WHERE RED TIDE OFTEN
APPEARS (IN JAPANESE),
W70-07850 05C

ENVIRONMENTAL DISPOSITION
THE ENVIRONMENTAL DISPOSITIONS OF ENVIRONMENTAL DECISION-
MAKERS,
W70-07993 06G

ENVIRONMENTAL EFFECTS
GERMINATION REQUIREMENTS OF THE DESERT SHRUB LARREA
DIVARICATA,
W70-07772 02I

ENVIRONMENTAL EFFECTS OF NUCLEAR COOLING FACILITIES,
W70-08125 05C

ENVIRONMENTAL QUALITY
THINKING SOCIAL-SCIENTIFICALLY ABOUT ENVIRONMENTAL QUALITY,
W70-07988 06B

ENZYMES
EFFECTS OF METAL POISONING ON FIVE LIVER ENZYMES IN THE
KILLIFISH (FUNDULUS HETEROCLITUS),
W70-07844 05C

EPHEMERAL STREAMS
INTERFERENCE RIPPLE MARKS FORMED BY EPHEMERAL STREAMS,
W70-07892 02J

EQUILIBRIUM PRICES
USE OF TAXES, SUBSIDIES, AND REGULATIONS FOR POLLUTION
ABATEMENT,
W70-07802 05G

EQUIPMENT
TECHNIQUES AND FACTORS INVOLVED IN AERATOR SELECTION AND
EVALUATION,
W70-07734 05D

THE PERFORMANCE OF THREE TYPES OF LEAF-WETNESS RECORDERS,
W70-07774 02I

START-UP PROBLEMS AT A METROPOLITAN DISTRICT PLANT,
W70-07806 05D

EROSION
EROSION BY BIOLOGICAL ACTIVITY IN TWO NEW ENGLAND SUBMARINE
CANYONS,
W70-07897 02J

VELOCITIES OF CULVERT JETS FOR INCIPIENT EROSION,
W70-07912 02J

EROSION PROCESSES
THE STUDY OF THE SCOURS BEHIND A SPILLWAY, (IN FRENCH),
W70-08095 08B

ESSENTIAL NUTRIENTS
CHANGES IN SOIL NUTRIENT STATUS RESULTING FROM OVERGRAZING
AND THEIR CONSEQUENCES IN PLANT COMMUNITIES OF SEMI-ARID

AREAS,
W70-07761 02G

ESTIMATING
ESTIMATION OF THE LINEAR EXPENDITURE SYSTEM,
W70-07755 06A

ESTIMATION
ESTIMATION OF THE LINEAR EXPENDITURE SYSTEM,
W70-07755 06A

ESTUARIES
RESEARCH NEEDS ON THERMAL AND SEDIMENTARY POLLUTION IN TIDAL WATERS,
W70-07656 05A

UTILIZATION OF PHYSICAL AND MATHEMATICAL MODELS IN MARINE WATER RESOURCES RESEARCH, PLANNING AND MANAGEMENT,
W70-07801 02L

ESTUARINE OXYGEN RESOURCES--PHOTOSYNTHESIS AND REAERATION,
W70-08103 02L

ESTUARINE POLLUTION
RESEARCH NEEDS ON THERMAL AND SEDIMENTARY POLLUTION IN TIDAL WATERS,
W70-07656 05A

EVALUATION
EFFICACY OF METHYLPENTYNOL AS AN ANESTHETIC ON FOUR SALMONIDS,
W70-07839 05C

EVAPORATION
EVAPORATION, POTENTIAL EVAPOTRANSPIRATION IN LEBANON, AND CALCULATED PICHE COEFFICIENT (IN FRENCH),
W70-07768 02D

FOREST HYDROLOGY IN A KARSTIC REGION OF SOUTHERN AUSTRALIA,
W70-07901 02D

EVAPOTRANSPIRATION
EVAPORATION, POTENTIAL EVAPOTRANSPIRATION IN LEBANON, AND CALCULATED PICHE COEFFICIENT (IN FRENCH),
W70-07768 02D

WATER RELATIONS OF THREE WARM DESERT SPECIES,
W70-07775 02I

SOME ASPECTS OF WATER MANAGEMENT FOR CROP PRODUCTION IN ARID AND SEMIARID ZONE OF INDIA,
W70-07797 03F

A GENERALISED COMPUTER PROGRAM FOR THE SOLUTION OF THE PENMAN EQUATION FOR EVAPOTRANSPIRATION,
W70-07877 02D

EXCAVATION
COVELL V SIOUX CITY (EXCAVATION FOR CHANNELING OF STREAM AS AFFECTING LATERAL SUPPORT FOR ADJACENT LAND).
W70-08053 04A

EXCESSIVE PRECIPITATION
FENMODE V AETNA CASUALTY AND SURETY CO OF HARTFORD, CONN (SURFACE WATERS DEFINED).
W70-07900 04A

WRIGHT V CITY OF ONEONTA (MUNICIPAL LIABILITY FOR DAMAGES CAUSED BY OVERFLOWING STREAM).
W70-08083 04A

EXPERIMENTAL WATERSHEDS
VEGETATION MANAGEMENT FOR WATER YIELD,
W70-07795 03B

EXPLOITABLE WATER
THE ASSESSMENT OF SOIL WATER STATUS AS IT AFFECTS PLANT WATER USE,
W70-07799 02I

EXPLORATION
A FOURTH BRINE HOLE IN THE RED SEA,
W70-07679 02K

EXPLOSIONS
USE OF EXPLOSIVE METHODS TO COMPACT SOIL DURING CONSTRUCTION OF IRRIGATION CANALS,
W70-07883 08D

EXPLOSIVE CONSTRUCTION
USE OF EXPLOSIVE METHODS TO COMPACT SOIL DURING CONSTRUCTION OF IRRIGATION CANALS,
W70-07883 08D

EXTENDED AERATION
KINETICS OF MODEL AND FIELD EXTENDED-AERATION WASTE WATER TREATMENT UNITS,
W70-07716 05D

POULTRY PROCESSOR MEETS CHALLENGE OF INCREASED WASTE LOAD,
W70-07956 05D

EXTERNALITIES
USE OF TAXES, SUBSIDIES, AND REGULATIONS FOR POLLUTION ABATEMENT,
W70-07802 05G

EXTRACTION
NEW PROCESS TO REMOVE PHENOLS FROM WASTE WATER,
W70-07722 05D

FACILITIES
SEWAGE WORKS MAINTENANCE,
W70-07831 05D

FAILURES
START-UP PROBLEMS AT A METROPOLITAN DISTRICT PLANT,
W70-07806 05D

FALLOUT
FALLOUT AND CLIMATE STUDIES ON FIRN CORES FROM CAMP CENTURY, GREENLAND,
W70-07667 05A

FARM PONDS
WINANS LAKE HILLS CORP V MOON (RIGHTS TO RECREATIONAL USE OF POND).
W70-08070 06E

FAT ACCUMULATION
EFFECTS OF NITROGEN LIMITATION ON THE GROWTH AND COMPOSITION OF UNICELLULAR ALGAE IN CONTINUOUS CULTURE,
W70-07957 05D

FAULTS(GEOLOGY)
THE RED SEA -- A GEOPHYSICAL BACKGROUND,
W70-07681 07C

FEDERAL JURISDICTION
UNITED STATES V RAY (FEDERAL JURISDICTION OVER AND RIGHT TO SUBMERGED CORAL REEFS).
W70-08012 06E

FEDERAL POWER ACT
KEY SALES CO V SOUTH CAROLINA ELECTRIC AND GAS CO (DAMAGES CAUSED BY RELEASE OF WATER FROM DAM).
W70-08010 04A

FERMENTATION
LIGNOSULFONATES IN PETROLEUM FERMENTATION,
W70-07828 05D

FERRIC CHLORIDE
BASIC STUDIES ON THE CLARIFICATION OF WASTE WATER CONTAINING DYES. I. PRECIPITATION OF DIRECT DYES BY FERRIC CHLORIDE,
W70-08144 05D

FERRIC SULPHATE
WOOL INDUSTRY WASTE WATERS (IN RUSSIAN),
W70-08140 05D

FERROUS SULFATE
TREATMENT OF WOOL SCOURING LIQUORS,
W70-08145 05D

FERTILITY
RESEARCH ON THE UTILIZATION OF SALINE WATER FOR IRRIGATION IN TUNISIA,
W70-07773 03C

FIBERS
FIBROUS POLYMERS,
W70-07874 08G

FIELD CAPACITY
THE ASSESSMENT OF SOIL WATER STATUS AS IT AFFECTS PLANT WATER USE,
W70-07799 02I

FILTRATION
CONSIDERATIONS IN DIGESTED SLUDGE ELUTRIATION,
W70-07821 05D

FILTRATION TECHNIQUES IN TERTIARY TREATMENT,
W70-07825 05D

ECONOMICAL UTILIZATION OF CAUSTIC SODA IN COTTON BLEACHERIES,
W70-07965 05D

FINANCIAL EMERGENCIES
STRATEGY FOR FINANCIAL EMERGENCIES,
W70-07749 06A

FIRM REGULATION
A GEOMETRIC TREATMENT OF AVERCH-JOHNSON'S BEHAVIOR OF THE FIRM MODEL,
W70-07748 06A

FISH
A CHARACTERIZATION OF TUNA PACKING WASTE,
W70-07951 05D

FISH OIL AND PROTEIN RECOVERED FROM FISH PROCESSING EFFLUENT,
W70-07953 05D

TEMPERATURE TOLERANCE OF EGGS AND YOUNG OF COLUMBIA RIVER CHINOOK SALMON,
W70-08129 05C

FISH BEHAVIOR
EFFICACY OF METHYLPENTYNOL AS AN ANESTHETIC ON FOUR SALMONIDS,
W70-07839 05C

FISH FOOD ORGANISMS
THE BIOLOGICAL RECOVERY OF THE CLINCH RIVER FOLLOWING A FLY ASH POND SPILL,
W70-07843 05C

FISH OIL

H OIL AND PROTEIN RECOVERED FROM FISH PROCESSING
LUENT,
-07953 05D

PHYSIOLOGY
ICACY OF METHYLPENTYNOL AS AN ANESTHETIC ON FOUR
MONIDS,
-07839 05C

CTATED BIBLIOGRAPHY ON METHYLPENTYNOL,
-07841 05C

ECTS OF METAL POISONING ON FIVE LIVER ENZYMES IN THE
LIFISH (FUNDULUS HETEROCLITUS),

PAMRAPAU CORP V CITY OF BAYONNE (RELATIVE RIGHTS IN SUBMERGED LAND IN FRONT OF RIPARIAN PROPERTY).
W70-08088 06E

MILLER V MILLER (RELATIVE RIGHTS TO USE OF ARTIFICIAL LAKE)
W70-08092 06E

WATSON V HOLLAND (POWER OF STATE TO GRANT DRILLING RIGHTS (SUBMERGED SOVEREIGN LANDS).
W70-08108 06E

OXIDES
GOETHITE-HEMATITE STABILITY RELATIONS WITH RELEVANCE TO SE WATER AND THE RED SEA BRINE SYSTEM,
W70-07697 02K

OXYGEN
THE NEWEST DEVELOPMENT IN LAKE LUCERNE (IN GERMAN),
W70-08106 02H

OXYGEN TRANSFER
TECHNIQUES AND FACTORS INVOLVED IN AERATOR SELECTION AND EVALUATION,
W70-07734 05D

OXYGENATION
TECHNIQUES AND FACTORS INVOLVED IN AERATOR SELECTION AND EVALUATION,
W70-07734 05D

OXYGENATION EFFICIENCY OF A BLADED ROTOR,
W70-07735 05D

ESTUARINE OXYGEN RESOURCES--PHOTOSYNTHESIS AND REAERATION,
W70-08103 02L

PACIFIC OCEAN
SUBMARINE VALLEY SYSTEMS AROUND THE CORAL SEA BASIN (AUSTRALIA),
W70-07653 02L

PAINTING
CAUSES AND PREVENTION OF COATINGS FAILURES,
W70-07872 08G

PAKISTAN
THE DETERMINATION OF THE DRAINAGE FACTOR AS A CRITERION FO THE SOILS OF THE INDUS PLAINS,
W70-07794 04A

PALEOCLIMATOLOGY
RADIOCARBON CHRONOLOGY OF RED SEA SEDIMENTS,
W70-07694 02J

PARATHION
SENSITIVITY OF POND FISH TO COTNION (AZINPHOSMETHYL) AND PARATHION,
W70-07852 05C

PARKS
IN RE HUTCHINSON RIVER PARKWAY EXTENSION (CONDEMNATION VAL OF RIPARIAN LAND).
W70-08058 06E

PARTICLE SHAPE
A THEORETICAL AND EXPERIMENTAL STUDY OF DRAG AND LIFT FORC ACTING ON A SPHERE RESTING ON A HYPOTHETICAL STREAMBED,
W70-07930 02J

PARTICLE SIZE
GRAIN SIZE PARAMETERS FOR SANDY-GRAVELS,
W70-07896 02J

PASTURE MANAGEMENT
CHANGES IN WATER BALANCE COMPONENTS WITH PASTURE MANAGEMEN IN SOUTH-EASTERN AUSTRALIA,
W70-07899 03B

PATH OF POLLUTANTS
JOLDERSMA V MUSKEGON DEVELOPMENT CO (POLLUTION OF WATER SUPPLY BY OIL WELL ON ADJOINING LAND).
W70-08026 05G

PEAK DISCHARGE
EFFECT OF URBANIZATION ON STORM WATER PEAK FLOWS,
W70-07671 04C

KEY SALES CO V SOUTH CAROLINA ELECTRIC AND GAS CO (DAMAGE CAUSED BY RELEASE OF WATER FROM DAM).
W70-08010 04A

PECUNIARY EXTERNALITY
PECUNIARY AND TECHNOLOGICAL EXTERNALITY, FACTOR RENTS, AN SOCIAL COSTS,
W70-07743 06A

PENMAN EQUATION
A GENERALISED COMPUTER PROGRAM FOR THE SOLUTION OF THE PENMAN EQUATION FOR EVAPOTRANSPIRATION,
W70-07877 02D

PENNSYLVANIA
HOWELL V SEWICKLEY TOWNSHIP (SUIT TO ENJOIN OPERATION OF RESERVOIR AS TOWN WATER SUPPLY).
W70-08021 03D

ARE V YOUNG (DISCHARGE OF SURFACE WATER ONTO ADJOINING AND).
70-08046 04A

IMON V HUDSON COAL CO (DISCHARGE OF MINE DRAINAGE INTO ITCH).
70-08060 05G

OMMONWEALTH V DOUGHERTY (POLICY BEHIND LICENSING OF LUMBERS).
70-08063 05G

OMMONWEALTH EX REL MCCORMICK V PHILADELPHIA AND R COAL AND RON CO (POLLUTION OF RIVER BY COAL MINING OPERATION).
70-08067 05G

ILLER V MILLER (PROPERTY RIGHTS IN ARTIFICIAL LAKES).
70-08089 06E

ILLER V MILLER (RELATIVE RIGHTS TO USE OF ARTIFICIAL LAKE).
70-08092 06E

CCLATING WATER
OSE V SOCONY-VACUUM CORP (NEGLIGENT POLLUTION OF ROUNDWATER).
70-08025 05G

IABILITY FOR POLLUTION OF SUBTERRANEAN WATERS.
70-08049 05G

IABILITY FOR POLLUTION OF SUBTERRANEAN WATERS (THE ISTINCTION BETWEEN SUBTERRANEAN STREAMS AND PERCOLATING ATERS).
70-08050 05G

IABILITY FOR POLLUTION OF SUBTERRANEAN WATERS (NEGLIGENCE OR THE POLLUTION OF SUBTERRANEAN WATERS OR NUISANCE CTIONS).
70-08051 05G

OWELL V SIOUX CITY (EXCAVATION FOR CHANNELING OF STREAM AS FFECTING LATERAL SUPPORT FOR ADJACENT LAND).
70-08053 04A

FORMANCE
ILTRATION TECHNIQUES IN TERTIARY TREATMENT,
70-07825 05D

IPHYTON
QUANTITATIVE METHOD FOR ASSESSING THE TOXIC EFFECTS OF OME WATER SOLUBLE SUBSTANCES, BASED ON CHANGES IN ERIPHYTON COMMUNITY STRUCTURE,
70-08101 05C

MEABILITY
YDRAULIC CONDUCTIVITY AND CERTAIN SOIL CHARACTERISTICS OF UBSOILS WITH SPECIAL REFERENCE TO DRAINAGE DESIGN IN THE LLUVIAL SOILS OF U.A.R.,
70-07762 02G

BSERVATIONS ON PORE PRESSURES BENEATH THE ASH LAGOON MBANKMENTS AT FIDDLER'S FERRY POWER STATION,
70-07886 08D

SONNEL
RAINING SANITARY ENGINEERING TECHNICIANS AT FAYETTEVILLE ECHNICAL INSTITUTE,
70-07723 05D

IRECTORY OF PERSONNEL, WATER RESOURCES IN WESTERN NEW YORK THIRD EDITION, OCTOBER 1969.
70-07803 09C

TICIDE RESIDUES
ESIDUES IN FISH, WILDLIFE, AND ESTUARIES - ORGANOCHLORINE ESTICIDES IN FUR SEALS,
70-07845 05C

TICIDE TOXICITY
ENSITIVITY OF POND FISH TO COTNION (AZINPHOSMETHYL) AND ARATHION,
70-07852 05C

TICIDES
ESTICIDES IN WATER,
70-08102 05C

ROLEUM
IGNOSOLFONATES IN PETROLEUM FERMENTATION,
70-07828 05D

VALUES
HE QUANTITATIVE DESCRIPTION OF SOIL MOISTURE STATES IN ATURAL HABITATS WITH SPECIAL REFERENCE TO MOIST SOILS,
70-07800 02G

NOLS
EW PROCESS TO REMOVE PHENOLS FROM WASTE WATER,
70-07722 05D

SPHATES
HOSPHATE ABSORPTION IN EELGRASS,
70-08114 02K

SPHORUS
HEMICAL PROCESSING OF WASTE WATER FOR NUTRIENT REMOVAL,
70-07810 05D

TOCHEMISTRY
HOTOCHEMICAL DEGRADATION OF REFRACTORY ORGANIC COMPOUNDS,
W70-07717 05D

PHOTOSYNTHESIS
CARBON DIOXIDE EXCHANGE OF SEEDLING PINES IN THE LABORATORY AS RELATED TO LOWER ELEVATION LIMITS,
W70-07764 02I

ESTUARINE OXYGEN RESOURCES--PHOTOSYNTHESIS AND REAERATION,
W70-08103 02L

THE ADAPTATION OF PLANKTON ALGAE. V. VARIATION IN THE PHOTOSYNTHETIC CHARACTERISTICS OF SKELETONEMA COSTATUM CELLS GROWN AT LOW LIGHT INTENSITY,
W70-08110 02K

PHOTOSYNTHETIC OXYGEN
PHOTOSYNTHESIS AND OXYGEN BALANCE IN STREAMS,
W70-07857 05G

PHOTOTROPHIC GROWTH
ENHANCEMENT BY GLYCEROL OF PHOTOTROPHIC GROWTH OF MARINE PLANKTONIC ALGAE AND ITS SIGNIFICANCE TO THE ECOLOGY OF GLYCEROL POLLUTION,
W70-07842 05C

PHYSIOLOGICAL ACTIVITY
MICROBIOLOGY OF DOMESTIC WASTES, I. PHYSIOLOGICAL ACTIVITY OF BACTERIA INDIGENOUS TO LAGOON OPERATION AS A FUNCTION OF SEASONAL CHANGE,
W70-07948 05D

MICROBIOLOGY OF DOMESTIC WASTES. II. A COMPARATIVE STUDY OF THE SEASONAL PHYSIOLOGICAL ACTIVITY OF BACTERIA INDIGENOUS TO A SEWAGE LAGOON,
W70-07949 05D

PIERS
SCOURS BEHIND STILLING BASINS WITH ENDSILLS OF BAFFLE-PIERS,
W70-07923 08B

AN INTERESTING HYDRAULIC EFFECT OCCURRING AT LOCAL SCOUR,
W70-07924 08B

PIEZOMETRY
GROUNDWATER CONTAMINATION,
W70-07766 05B

PILOT PLANTS
TREATMENT OF TEXTILE WASTES IN AERATED LAGOONS,
W70-07966 05D

PINCTADA FUCATA
EFFECTS OF NITRATE OF CULTURE WATER ON THE GROWTH OF THE JAPANESE PEARL OYSTER (IN JAPANESE),
W70-07846 05C

EFFECTS ON THE GROWTH OF JAPANESE PEARL OYSTER OF THE VARIOUS ALKALINE REAGENTS ADDED TO THE CULTURE WATER FOR THE CONTROL OF ITS PH (IN JAPANESE),
W70-07849 05C

PINE TREES
CARBON DIOXIDE EXCHANGE OF SEEDLING PINES IN THE LABORATORY AS RELATED TO LOWER ELEVATION LIMITS,
W70-07764 02I

DROUGHT RESISTANCE OF MONTEREY PINE NEEDLES,
W70-07780 02I

FOREST HYDROLOGY IN A KARSTIC REGION OF SOUTHERN AUSTRALIA,
W70-07901 02D

PIPES
ALUMINUM PIPE SOURCE OF CONCRETE-PUMPING PROBLEMS.
W70-07875 08F

WHITMAN V FORNEY (OBSTRUCTION OF DRAINAGE PIPE WHICH REPLACED DITCH).
W70-08087 04A

PLANNING
WATER RESOURCES OF NEW MEXICO OCCURRENCE, DEVELOPMENT, AND USE,
W70-07786 06D

SIMPLIFICATION OF INTEGRATED STORMWATER PLANNING FOR MODERN, MULTIPLE LAND USE IN URBAN AND SUBURBAN DEVELOPMENTS,
W70-07981 04C

ANTICIPATIONS OF CHANGE A SOCIO-ECONOMIC DESCRIPTION OF A KENTUCKY COUNTY BEFORE RESERVOIR CONSTRUCTION,
W70-07994 06B

PLANT CELL PERMEABILITY
THE EFFECT OF SALINITY ON PERMEABILITY OF ROOTS TO WATER,
W70-07777 02I

PLANT DENSITY
EFFECT OF PLANT DENSITY AND GROWTH DURATION ON GRAIN SORGHUM YIELD UNDER LIMITED WATER SUPPLY,
W70-07789 03F

PLANT GROWTH
BIOMASS OF DESERT WINTER ANNUAL PLANT POPULATIONS IN SOUTHERN NEVADA,
W70-07763 02I

WATER STRESS AND APICAL MORPHOGENESIS IN BARLEY,
W70-07770 02I

GERMINATION REQUIREMENTS OF THE DESERT SHRUB LARREA

DIVARICATA,
W70-07772 02I

GENETIC VARIABILITY IN ROOT DEVELOPMENT IN RELATION TO DROUGHT TOLERANCE IN SPRING WHEATS,
W70-07785 3F

SOME EFFECTS OF SOIL MOISTURE STRESS ON THE GROWTH OF WHEAT (TRITICUM AESTIVUM L. EM THELL.),
W70-07790 03F

ENHANCEMENT BY GLYCEROL OF PHOTOTROPHIC GROWTH OF MARINE PLANKTONIC ALGAE AND ITS SIGNIFICANCE TO THE ECOLOGY OF GLYCEROL POLLUTION,
W70-07842 05C

PLANT GROWTH REGULATORS
THE ROLE OF ROOT CYTOKININS DURING WATER AND SALINITY STRESS,
W70-07798 02I

PLANT MOISTURE CONTENT
WATER RELATIONS OF THREE WARM DESERT SPECIES,
W70-07775 02I

PLANT PHYSIOLOGY
SOIL-PLANT RELATIONSHIPS OF TWO STEPPE DESERT SHRUBS,
W70-07757 02I

WATER STRESS AND APICAL MORPHOGENESIS IN BARLEY,
W70-07770 02I

PHYSIOLOGICAL ASPECTS OF DROUGHT DORMANCY IN GRASSES,
W70-07776 02I

DROUGHT RESISTANCE OF MONTEREY PINE NEEDLES,
W70-07780 02I

ENHANCEMENT BY GLYCEROL OF PHOTOTROPHIC GROWTH OF MARINE PLANKTONIC ALGAE AND ITS SIGNIFICANCE TO THE ECOLOGY OF GLYCEROL POLLUTION,
W70-07842 05C

PLANT TISSUES
ABSORPTION OF NA, CL, AND B BY DESERT SALTBUSH IN RELATION TO COMPOSITION OF NUTRIENT SOLUTION CULTURE,
W70-07791 02I

PLANT WATER POTENTIAL
THE EFFECT OF SALINITY ON PERMEABILITY OF ROOTS TO WATER,
W70-07777 02I

PLANTING MANAGEMENT
EFFECTS OF SEEDING RATE AND ROW SPACING ON ESTABLISHMENT AND YIELD OF CRESTED WHEATGRASS,
W70-07792 03F

PLUMBING
COMMONWEALTH V DOUGHERTY (POLICY BEHIND LICENSING OF PLUMBERS).
W70-08063 05G

POISSON RATIO
RATION OF HORIZONTAL TO VERTICAL STRESSES FOR GRAVELS,
W70-07885 08D

POLICE POWER
LARSON V BUSSE (DRAINAGE SYSTEMS EMINENT DOMAIN COMPENSATION).
W70-08030 04A

POLITICAL ASPECTS
WEATHER MODIFICATION IN POPULATED AREAS,
W70-07984 03B

POLLUTION ABATEMENT
STUDY OF WASTE WATER FROM DYEWORKS (IN FRENCH),
W70-07720 05D

SOME LONG-TERM TRENDS IN WATER QUALITY OF RIVERS AND LAKES,
W70-07983 05C

WATER POLLUTION ABATEMENT BY IMPROVED COAGULATION OF EFFLUENTS FROM LYE-PEEL POTATO PROCESSING PLANTS,
W70-07995 05D

COMMONWEALTH EX REL MCCORMICK V PHILADELPHIA AND R COAL AND IRON CO (POLLUTION OF RIVER BY COAL MINING OPERATION).
W70-08067 05G

POLLUTION SOURCES
GOOD HOUSEKEEPING IS BEST SOLUTION TO STREAM POLLUTION,
W70-07756 05B

POLYAMIDES
THE PURIFICATION OF WASTE WATER IN THE PRODUCTION OF POLYAMIDE-FIBER (IN GERMAN),
W70-07975 05D

POLYCHLORINATED BIPHENYLS
RESIDUES IN FISH, WILDLIFE, AND ESTUARIES - ORGANOCHLORINE PESTICIDES IN FUR SEALS,
W70-07845 05C

POLYELECTROLYTE USE
WATER POLLUTION ABATEMENT BY IMPROVED COAGULATION OF EFFLUENTS FROM LYE-PEEL POTATO PROCESSING PLANTS,
W70-07995 05D

POLYETHYLENES
EXPERIENCE IN CONSTRUCTION OF POLYETHYLENE - CANALS,
W70-07884 08G

POLYMER
FLOCCULATION OF BULKED ACTIVATED SLUDGE WITH POLYELECTROLYTES,
W70-07727 05D

POLYMERS
FIBROUS POLYMERS,
W70-07874 08G

PONDS
ALGAL PERIODICITY AND WASTE RECLAMATION IN A STABILIZATIO POND ECOSYSTEM,
W70-07838 05D

CONFER V PIRMAN (BOUNDARY DISPUTE AS TO POND BED).
W70-08059 06E

UNITED STATES LEATHER CO V CITY OF LYNN (TITLE TO AND BOUNDARIES OF SUBMERGED LAND).
W70-08078 06E

POPULATION DENSITY
CARROT POPULATION DENSITY AND YIELD IN AN ARID ENVIRONMEN
W70-07787 03F

PORE PRESSURE
OBSERVATIONS ON PORE PRESSURES BENEATH THE ASH LAGOON EMBANKMENTS AT FIDDLER'S FERRY POWER STATION,
W70-07886 08D

PORE WATER
HYSTERESIS OF PORE WATER IN GRANULAR POROUS BODIES,
W70-07878 02G

POROSITY
THE QUANTITATIVE DESCRIPTION OF SOIL MOISTURE STATES IN NATURAL HABITATS WITH SPECIAL REFERENCE TO MOIST SOILS,
W70-07800 02G

POROUS MATERIALS
HYSTERESIS OF PORE WATER IN GRANULAR POROUS BODIES,
W70-07878 02G

POROUS MEDIA
HYSTERESIS OF PORE WATER IN GRANULAR POROUS BODIES,
W70-07878 02G

ANALYTICAL STUDIES ON THE EFFECT OF FRICTION AND COHESION FLOTATION GRADIENTS,
W70-07927 08B

PORTLAND CEMENTS
ALUMINUM PIPE SOURCE OF CONCRETE-PUMPING PROBLEMS.
W70-07875 08F

POTABLE WATER
ALGAL REMOVAL IN UNIT PROCESSES,
W70-08107 05F

POTASSUM COMPOUNDS
PROFITABLE USE OF WASTE MATERIALS IN COTTON MILLS,
W70-08137 05D

POTATO PROCESSING WASTES
WATER POLLUTION ABATEMENT BY IMPROVED COAGULATION OF EFFLUENTS FROM LYE-PEEL POTATO PROCESSING PLANTS,
W70-07995 05D

POTENTIAL EVAPOTRANSPIRATION
EVAPORATION, POTENTIAL EVAPOTRANSPIRATION IN LEBANON, AND CALCULATED PICHE COEFFICIENT (IN FRENCH),
W70-07768 02D

POULTRY
POULTRY PROCESSOR MEETS CHALLENGE OF INCREASED WASTE LOAD,

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 20
OCTOBER 15, 1970

W70-08149 -- W70-08584

of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ENT STATE OF THE PROBLEM OF R STRUCTURE,

Gurikov.
er in Biological Systems Consultants Bu-ew York, p 1-8.

tors: *Water structure, *Hydrogen bond-olecular structure, *Physicochemical pro-Ice, Thermodynamic behavior, Aqueous s, X-ray analysis.
ers: *Framework structure, *Clathrate ork, *Framework voids, *Bond-rupture Cold neutron scattering, Raman spectrun, -vibration spectrum, Dodecahedral struc-olecular orientation.

ed to other liquids the physicochemical es of water are highly unusual. The struc-water is of great importance with respect to operties, and framework defects have been ed as a special component of water struc-ecent studies on framework structure are d, and the principle concepts to emerge se studies are: (1) The great similarity of nd ice structures (2) The rupture of H-ith temperature increase (3) Two types of (centrosymmetric and mirror-symmetric) decahedral structure formation of the type (5) Characteristic temperature near here are abrupt changes in the properties cture of water. Framework defects, ranging nding of bonds to complete rupture, are y unimportant in ice but become an impor-ctural component in the liquid state. Two structural models of water are discussed: (1) Mosaic models in which water is treated as an ideal mixture of segments having an ice-like structure and segments with a more compact structure lacking H-bonds (2) Two-state models in which molecules at the junctions of 3-dimensional H-bond networks correspond to one state while molecules occupying framework voids correspond to the other. The ability of these models to account for various experimental phenomena is discussed. (Casey-Arizona)

1B. Aqueous Solutions and Suspensions

COLLIGATIVE PROPERTIES OF ANOMALOUS WATER,

Bristol Univ. (England). Dept. of Physical Chemistry.
D. H. Everett, J. M. Hayes, and P. J. McElroy.
Nature, Vol 226, No 5250, p 1033-1037, June 13, 1970. 5 p, 4 fig, 17 ref.

Descriptors: *Water structure, *Water properties, *Gels, *Silica, Colloids, Viscosity, Thermodynamics, Aqueous solutions, Physical properties, Vapor pressure, Water chemistry.
Identifiers: *Anomalous water, Polywater.

Investigations of the phase behavior on freezing and subsequent melting and of other properties indicate that anomalous water is a solution containing a fixed amount of relatively involatile material in normal water. There seems to be no need to postulate the existence of a new polymer of water in such solutions. If only water and silica are present, the properties are consistent with those of a silicic acid gel. SALTING COEFFICIENTS FROM SCALED PARTICLE THEORY,

Connecticut Univ., Storrs. Dept. of Chemistry.
W. L. Masterton, and Tei Pei Lee.
Journal of Physical Chemistry, Vol 74, No 8, p 1776-1782, April 16, 1970. 7 p, 13 ref. OWRR Project H-013-CONN.

Descriptors: *Water chemistry, *Aqueous solutions, *Electrolytes, *Water properties, Solvent extractions, Ions, Saline water systems, Solubility, Desalination, Thermodynamics.
Identifiers: Salting coefficients.

Scaled particle theory is used to derive a general expression for the salting coefficient, ks, which appears in the Setschenow equation. This expression is essentially a sum of two terms, one of which will ordinarily be positive (salting out), while the other will be negative (salting in). Calculated values of ks are in excellent agreement with experiment for systems in which the molecular and ionic diameters are relatively small. For large molecules, the agreement is poorer, as is true with classical theories of the salt effect. The magnitude of ks is very sensitive to uncertainties in the diameters of anions and cations. (Knapp-USGS)

GENERAL PROBLEMS IN THE THEORY OF IONIC HYDRATION IN AQUEOUS SOLUTIONS,

Akademiya Nauk SSSR, Moscow. Institut Obshchei i Neorganicheskoi Khimii.
O. Ya. Samoilov.
Translated from Russian. In: Water in Biological Systems Consultants Bureau, New York, 1969, p 20-27. 6 fig, 1 tab, 29 ref.

Descriptors: *Aqueous solutions, *Hydrogen bonding, *Solubility, *Thermodynamic behavior, *Ionization, Sodium, Potassium, Dispersion, Solutions, Solvation.
Identifiers: *Ionic hydration.

An aqueous electrolyte solution is a heterodynamic system involving 3 types of interaction: (1) Ionic interactions which are long-range forces (2) Water molecule-ionic interactions (primarily ion-dipole) that weaken more rapidly with distance (3) Interactions between water molecules, with the formation of H-bonds which are short-range forces. The state of an ion in solution is governed not by the total interaction energies but principally by changes in energy over short distances. Positively hydrated ions such as Mg, Li, and Na ions strengthen the bonds between water molecules and their nearest neighbors, while K, Cs, and Cl ions are negatively hydrated with opposite effects. Experimental evidence for these phenomena is discussed. Negative hydration occurs only in those cases where solvent molecule interactions are sufficiently strong, and is displaced by positive hydration in aqueous solutions when temperature rises. This is due to rupture of H-bonds, decreasing solvent molecule interactions. Results of studies of the solubility of NaCl in methanol solutions with ethanol added, and in ethanol solutions with methanol added, accorded with the view that increases in structural stabilization of a solvent leads to decreases in solute solvation. (Casey-Arizona)

Water is incorporated into simple and supermolecular biopolymeric compounds and serves both functional and structural roles. Determination of its precise localization is difficult, but it is known to obey the principle of densest packing in organic crystals. Crystals containing H have a tendency to form a maximum number of H-bonds, which only rarely conflicts with densest packing. When water is incorporated into organic crystals, copacking of the very small water molecules and the larger molecules occurs, leading to space filling and the most favorable conditions for H-bonding. The number, state, and distribution of the water molecules are determined by many characteristics of the main compound molecules such as shape and location of hydrophilic groups. The structures of the hydrates of several low nolecular weight biopolymers are described, particularly with reference to their H-bonding. Structures containing chains of water molecules must be arranged to conform with the physicochemical requirement for water of 4.5 angstrom unit identity periods along the chain. Examples of this are described for some linear and cyclic molecules. Compounds are also described in which electrostatic forces play a role in addition to H-bonds and intermolecular forces. Finally, the crucial importance of water in organic phosphates and hydrophosphates is considered. (Casey-Arizona)

2A. General

STUDY OF WATERSHED HYDROLOGY BY THE WATERSHED EXPERIMENTATION SYSTEM,
Illinois Univ., Urbana. Dept. of Hydraulic Engineering.
Ven Te Chow.
Nature and Resources, Bulletin of the International Hydrological Decade, Vol 6, No 1, p 12-14, March 1970. 3 p.

Descriptors: *Watersheds (Basins), *Hydrology, *Laboratory tests, *Model studies, Hydraulic models, Computer models, International Hydrological Decade, Simulated rainfall, Hydrogeology, Rainfall-runoff relationships, Streamflow, Forecasting, Simulation analysis.
Identifiers: Illinois University, Hybrid hydraulic-computer models.

The Watershed Experimentation System (WES) developed in the Hydraulic Engineering Laboratory of the Department of Civil Engineering, University of Illinois, integrates electronic, hydraulic, pneumatic, and structural components. For research on hydraulic and hydrologic problems in engineering, the WES can generate an artificial storm of given temporal and spatial distributions of rainfall intensities and move it in any desired direction over an area of 40 x 40 ft or less in the laboratory. Within this area, a testing drainage basin can be built and its hydraulic and hydrologic parameters, including size, shape, slope, surface roughness, stream pattern and storage capacity can be represented and altered. The runoff from the basin is automatically measured by sonars and instantaneously transmitted to an electronic computer for processing and printing-out of the hydrograph. (Woodard-USGS)

A CONCEPTUAL MODEL OF THE GROUNDWATER REGIME AND THE HYDROGEOLOGIC ENVIRONMENT,
Research Council of Alberta, Edmonton.
J. Toth.
Journal of Hydrology, Vol 10, No 2, p 164-176, February 1970. 13 p, 1 fig, 9 ref.

Descriptors: *Hydrogeology, *Model studies, *Equations, *Mathematical models, Aquifers, Groundwater movement Hydrologic budget, Regime, Mathematical studies, Discharge (Water), Climates, Geology, Water chemistry.
Identifiers: Hydrogeologic environment, Groundwater regime.

A conceptual model for the description, explanation, prediction, and control of hydrogeologic conditions is composed of two systems of physical and chemical parameters: the Hydrogeologic Environment, and the Groundwater Regime. The three components of the environment, each comprising a great number of parameters, are topography, geology, and climate. The necessary and sufficient parameters of the groundwater regime are: (1) amount of water, (2) geometric distribution of water movement, (3) volume or velocity of the flow, (4) chemical composition, (5) temperature, and (6) regime variance. The environment and regime are related quantitatively and each regime parameter can be expressed mathematically as a function of the environmental components. This allows the evaluation of the groundwater regime if the environmental conditions are known, as well as inferences concerning the aquifer from known properties of the regime. To date few parameters have been evaluated exactly and mostly conceptual equations are presented. (Knapp-USGS)

GROUNDWATER - SURFACE WATER RELATION DURING PERIODS OF OVERLAND FLOW,
Geological Survey, Indianapolis, Ind.
James F. Daniel, Louis W. Cable, and Ronald J. Wolf.
For sale by the Superintendent of Documents US Government Printing Office, Washington, DC 20402 - Price $3.25. In: Geological Survey Reasearch 1970, Chapter B, US Geological Survey Professional Paper 700-B, p B219-B223, 1970. 5 p, 8 fig, 3 ref.

Descriptors: Surface-groundwater relationships, *Flood plains, *Bank storage, *Floods, *Overland flow, Base flow, Hydrograph analysis, Hydrographs, Aquifers, Alluvial channels, Indiana.
Identifiers: White River (Ind).

The groundwater exchange mechanism at the stream interface during periods of overland runoff was investigated by means of observation wells installed in the flood plain on the White River near Noblesville, Ind. Groundwater discharge decreases with the beginning of a stream rise, ceases after a short time interval, and then bank storage begins. A volume of discharge from the aquifer equal to that which entered as bank storage at the study site was dissipated 54 hours after an overbank peak, 42 hours after a medium peak and 50 hours after a small peak. The results were used to formulate a theoretical method for stream-hydrograph separation of base flow and overland flow. The separation method shows no groundwater runoff until bank storage and channel storage volumes have been dissipated. All discharge in the stream before and after this period is equal to that contributed by the aquifer system. (Knapp-USGS)

2B. Precipitation

SPACE VARIATIONS OF PRECIPITATIONS FOR RAINAGE NETWORK DESIGN,
Agricultural Research Service, Danville, Vt. Soil and Water Conservation Research Div.
Robert L. Hendrick, and George H. Comer.
Journal of Hydrology, Vol 10, No 2, p 151-163, February 1970. 13 p, 11 fig, 1 tab, 5 ref.

Descriptors: *Distribution patterns, *Rainfall, *Network design, *Rain gages, Rainfall disposition, Correlation analysis, Demonstration watersheds, Topography, Statistical methods, Vermont.
Identifiers: Sleepers River Watershed (Vt).

Space variations of daily precipitation are examined in terms of the field of inter-station correlations over the Sleepers River Watershed in northern Vermont. The correlation field about a control gage is dependent on inter-station distance and azimuth, daily rainfall amount, and the season of the year. No dependence on elevation or elevation difference (slope) was found. A correlation field function is derived which is then used to determine raingage density and configuration required for specified accuracy of watershed precipitation estimates. (Knapp-USGS)

PROBABLE MAXIMUM PRECIPITATION FOR THE LOWER RIO GRANDE,
Weather Bureau, Silver Spring, Md. Office of Hydrology.
John T. Riedel.
Water Resources Bulletin, Vol 6, No 3, p 439-451, May-June 1970. 13 p, 8 fig, 6 tab, 5 ref.

Descriptors: *Probable maximum precipitation, *Rio Grande, *Hurricanes, *Flood forecasting, Precipitation (Atmospheric), Rainfall, Depth-area-duration analysis, Planning, Flood protection, International Boundary and Water Commission, Mexico, United States.
Identifiers: Lower Rio Grande Valley.

To aid in planning and design of additional flood protection on the Lower Rio Grande, the Hydrometeorological Branch prepared a probable maximum precipitation study for the International Boundary and Water Commission (United States and Mexico) and the Republic of Mexico. Five drainages from 2,000 to over 17,000 square miles in area between Falcon and Anzalduas Dams including Rio San Juan and Rio Alamo in Mexico are the areas of concern. The great rains of hurricane Beulah, September 19-24, 1967 verified that additional protection is needed. Procedures for estimating probable maximum precipitation (PMP) are described. A particular problem was to estimate rainfall potential for the Sierra Madre Oriental in Rio San Juan and Alamo drainages. These mountains form a north-south windward-facing slope and barrier of over 7,000 feet in elevation. A detailed study was made of rains from hurricane Beulah. The storm produced the greatest known rain depths in North America for 50,000 square miles or greater, and durations longer than 48 hours. (Knapp-USGS)

DUSTINESS OF AIR DURING DUST STORMS ON THE MANGYSHLAK PENINSULA (IN RUSSIAN),
S. S. Kharitonova.
Meteorologiya i Gidrologiya, No 5, p 87-88, 1969. 2 p, 4 ref.

Descriptors: *Dust storms, *Air pollution, Wind velocity, Particle size, Wind erosion, Soil erosion, Air environment, Humidity, Air temperature, Sediment transport, Winds.
Identifiers: *Air quality measurements, Dust fall, USSR, Mangyshlak Peninsula.

Data are presented from observations of 220 dust storms studied during 1964-68 on the Mangyshlak

insula, USSR. The storms lasted from several utes to 18 hours each. Air samples for analysis e collected at heights of 3,10, and 20 m above ground, and measurements of atmospheric temature, humidity, and wind conditions were orded at the same time. Results showed that t storms are of local character, originating at d speeds higher than 6-7 m/sec and independt of wind direction. Dust particles of 0.01 - 0.25 ron predominated. The highest dust concentrain a storm was 245 mg/cu m at 3 m above the und. Highest average dustiness occurred in mer (40 mg/cu m). The most rapid decrease of t in the air was observed at heights between 3-n. (Lang-USGS)

OBABLE MAXIMUM PRECIPITATION ER SOUTH PLATTE RIVER, COLORADO, D MINNESOTA RIVER, MINNESOTA,
ather Bureau, Washington, D.C. Office of drology.
n T. Riedel, Francis K. Schwarz, and Robert L. aver.
port available for sale by Superintendent of cuments, US Government Printing Office, shington, DC 20402 - Price $1.25. US Weather reau Hydrometeorological Report No 44, Janua-969. 114 p, 59 fig, 23 tab, 25 ref.

scriptors: *Probable maximum precipitation, ood forecasting, *Mississippi River, *Colorado, innesota, Weather forecasting, Snowmelt, Dis-ution patterns, Meteorology, Synoptic analysis, ximum probable flood, Weather data, Depth-a-duration analysis, Flood control; Planning.
ntifiers: *South Platte River (Colo), Minnesota er.

e great rain and snowmelt floods on the Upper ssissippi and its tributaries in April were among most disastrous ever experienced in these areas. r example, at Carver on the Minnesota River the vious high stage of 1952 was exceeded by 6 feet. other flood resulted in great damage along the uth Platte River in and near Denver from ex-mely heavy thunderstorm-type rainfall of about ours duration centered on upstream tributaries the south of Denver. Both floods were occa-ned by intense examples of common teorological processes in the respective regions d seasons -- snowmelt over a broad area in spring er the Upper Mississippi and intense short-dura-n storms to the immediate east of the Rockies ring the May-June maximum storm period of t area. The Hydrometeorological Branch of the eather Bureau prepared probable maximum cipitation estimates for these basins above spective dam sites in order to revise and update llway design floods. The basic method for esti-ting PMP is the transposition and moisture max-ization of storms. The two reports to the Corps Engineers have been incorporated into one lume in order to illustrate a variety of methods of imating probable maximum precipitation. (K-pp-USGS)

SNOW HYDROLOGY IN THE FOREST ENVIRONMENT,
British Columbia Univ., Vancouver. Dept. of Forestry.
W. W. Jeffrey.
In: Snow Hydrology, Proceedings of Workshop Seminar at New Brunswick University, Fredericton, February 28-29, 1969; Published by Secretariat, Canadian National Committee for the International Hydrological Decade, Ottawa, p 1-19, 1970. 19 p, 9 fig, 7 tab, 59 ref.

Descriptors: *Snow management, *Forest management, *Water yield improvement, Snowpacks, Soil-water-plant relationships, Water conservation, Interception, Albedo, Water balance, Solar radiation, Evapotranspiration, Snowfall, Snowmelt, Runoff, Watershed management.
Identifiers: Snow hydrology, Canada.

The forest ecosystem differs from other vegetated sites primarily in its protusion of a large intercepting and radiating biomass above the snowpack surface and into the atmosphere. This protruding biomass is of highly complex and extremely variable three-dimensional geometry. The biomass, extending into the atmosphere for as much as 200 feet or more above the soil surface, affects wind movement and turbulent flux of sensible heat; it absorbs shortwave radiation and emits longwave; it modifies air temperature; it intercepts precipitation as rain, snow or fog; it transpires freely during the growing season, and perhaps to some extent over winter; it affects soil temperature, soil freezing and soil porosity; it influences the drainage pattern of cold air in sloping terrain. Most of the particular characteristics of the forest environment may be ascribed to the influence of this aerial biomass. Management of snow zone forests has potentialities for both desirable effects, as in larger flood peaks. (Knapp-USGS)

SNOW HYDROLOGY OF THE PRAIRIE ENVIRONMENT,
Saskatchewan Univ., Saskatoon. Div. of Hydrology.
D. M. Gray.
In: Snow Hydrology, Proceedings of Workshop Seminar at New Brunswick University, Fredericton, February 28-29, 1969: Published by Secretariat, Canadian National Committee for the International Hydrological Decade, Ottawa, p 21-33, 1970. 13 p, 7 fig, 4 tab, 10 ref.

Descriptors: *Snowpacks, *Grasslands, Snowfall, Snowmelt, Water balance, Water yield, Climatology, Snow surveys, Albedo, Solar radiation, Snow management.
Identifiers: Snow hydrology, Canada, Prairies.

Heat-budget or Energy-Budget equations are used to study the disposition of Prairie snowpacks. Unique features of the Prairie environment which affect the magnitudes of the heat components of the equation as compared to their evaluation in other regions of the country are discussed. On the Prairies, snow represents a main and vital source of the manageable fresh water supply. In these semi-arid regions, about 80-85% of the streamflow in the major river systems and the water stored in prairie dugouts and sloughs comes from the shallow snowpack. With the normal climatic conditions which prevail on the Prairies during the winter months, the net energy exchange is negative (outward) resulting in a lowering of the snowpack temperature below freezing (32 deg F), the amount of evaporation from the pack is negligible, and the net convective heat transfer to or from the pack is negligible. The relative importance of these components to the exchange changes at the time of melt or under Chinook conditions. (Knapp-USGS)

PROBLEMS OF MEASURING AND EVALUATING SNOWCOVER,
Canada Department of Transport, Toronto (Ontario). Meteorological Branch.
G. A. McKay.
In: Snow Hydrology, Proceedings of Workshop Seminar at New Brunswick University, Fredericton, February 28-29, 1969: Published by Secretariat, Canadian National Committee for the International Hydrological Decade, Ottawa, p 49-65, 1970. 17 p, 9 fig, 5 tab, 10 ref.

Descriptors: *Snow surveys, *Snowpacks, *Water equivalent, Snowmelt, Water yield, Snowfall, Precipitation (Atmospheric), Synoptic analysis, Winds, Vegetation effects, Energy budget, Water balance, Measurement.
Identifiers: Snow hydrology, Canada.

Snowcover measurements are required generally to determine the water equivalent or an index of the water equivalent over an area. Measurements of the structure of the cover are also necessary for the study of snow melt, trafficability and other properties. The water equivalent of snowcover and the character of the snow cover at a point can be measured with reasonable precision; however, there are difficulties in obtaining precise measurements of the water equivalent of the snow cover over an area. These difficulties arise from the heterogeneous nature of snowcover, and the limitations of instruments and measuring techniques. The heterogeneous character of the snowcover and the climatic controls which shape the pack are discussed to indicate the nature of the measurement problem. Only brief reference is made to measurements and instruments. (Knapp-USGS)

SNOW ACCUMULATION RELATED TO ELEVATION, ASPECT AND FOREST CANOPY,
Colorado State Univ., Fort Collins. Dept. of Watershed Resources.
J. R. Meiman.
In: Snow Hydrology, Proceedings of Workshop Seminar at New Brunswick University, Fredericton, February 28-29, 1969: Published by Secretariat, Canadian National Committee for the International Hydrological Decade, Ottawa, p 35-47, 1970. 13 p, 3 tab, 70 ref.

Descriptors: *Snowpacks, *Snow cover, Altitude, Forests, Vegetation effects, Elevation, Topography, Weather, Climates, Water yield, Water balance.
Identifiers: Snow hydrology.

North American studies on the relative magnitude of the effects of elevation, aspect, and the forest canopy on snow accumulation within the boundary conditions of atmospheric factors and major physiography of specific sites are reviewed. There are strong indications that accumulation, irrespective of melt, is related to aspect. This is generally

reflected in regionalization of accumulation areas but such effects may exist on a very localized basis as well. Generally the differences resulting from canopy influences tend to be smaller than those associated with elevational changes. The effects of elevation, aspect, and forest canopy on maximum snowpack water equivalent exhibit tremendous variability between and within given physiographic-climatic boundary conditions. (Knapp-USGS)

THE SYNTHESIS OF SNOWMELT HYDROGRAPHS,
Maine Univ., Orono. Water Resources Research Center.
W. Viessman, Jr.
In: Snow Hydrology, Proceedings of Workshop Seminar at New Brunswick University, Fredericton, February 28-29, 1969: Published by Secretariat, Canadian National Committee for the International Hydrological Decade, Ottawa, p 67-75, 1970. 9 p, 7 fig, 7 ref.

Descriptors: *Snowmelt, *Hydrographs, *Synthetic hydrology, *Hydrograph analysis, *Routing, Streamflow forecasting, Water yield, Water equivalent, Unit hydrographs, Time lag, Water storage.
Identifiers: Snow hydrology.

The synthesis of snowmelt or rainfall-snowmelt hydrographs is discussed. It is likely that such hydrographs are more difficult to adequately generate than those produced by other antecedent conditions. Not only must the usual basin parameters and losses be considered, but in addition the snowmelt process becomes exceedingly important. It is also necessary to consider periods of continued rainfall and snowmelt. Another complicating factor is that the usual system of categorizing losses is not generally applicable. Rain-on-snow or snowmelt-only hydrographs are usually synthesized through the use of unit hydrographs or storage routing techniques. In either case the effective input must be determined. This requires a fundamental knowledge of the drainage basin and snowpack characteristics. The computed outflow cannot be expected to be any more reliable than the finally estimated input. Hydrographs might be synthesized by considering the basic differential equations governing fluid flow. As research continues and computer capacity increases, such an approach will likely become a practical working tool. (Knapp-USGS)

CONDITONS UNDER WHICH SOLAR RADIATION PENETRATES INTO ICE,
S A Shishokin
Transl from Transactions of the Kazakh Hydrometeorological Scientific Research Institute (Trudy KazNIGMI), No 32, p 129-138, 1969. Soviet Hydrology: Selected Papers, Issue No 1, p 98-106, 1969. 9 p, 5 fig, 4 tab, 7 ref

Descriptors: *Solar radiation, *Ice, *Albedo, Cryology, Heat balance, Melting, Instrumentation, Measurement
Identifiers: Ice transparency, USSR

Penetration of solar radiation into ice depends on solar height, the type of radiation, the structure of the ice, its thickness, and its degree of decay. Actinometric observations were made on the radiation regime of the ice cover on the Ili River, USSR, in the spring of 1963 and in the upper pool of the Krasnoyarsk hydroelectric power station in 1964. Global radiation and the radiation reflected from the surface of the sample were determined at the beginning and end of a series of measurements of radiation intensity in the ice. To exclude the influence of reflection from the surfaces surrounding the ice, an albedometer was installed at a height of 19.5 cm. In the absence of local impurities, the intensity of radiation reflected from the ice is the same. Most intense light attenuation occurs in a relatively thin surface layer for all types of ice. The thickness of this layer is less than 5-6 cm for water and slush ice. It is approximately 25 cm for snow-slush ice and corresponds to the lower boundary of the snow ice layer. In the layer of intense light attenuation, the amount of penetrating radiation decreases by a factor of 2.2 in monocrystalline ice, a factor of about 3.5 in slush ice, and a factor of 7-8 in snow ice. Below this layer, radiation intensity decreases relatively slowly, nearly linearly. (Knapp-USGS)
W70-08255

PROBABILITY CHARACTERISTICS OF THE FREEZE-UP AND BREAKUP DATES OF RIVERS,
B. M. Ginzburg.
Transl from Trudy Gidromet. Tsentra, No 40, p 21-39, 1969. Soviet Hydrology: Selected Papers, Issue No 1, p 64-78, 1969. 15 p, 4 fig, 9 tab, 26 ref.

Descriptors: *Ice breakup, *Freezing, *Rivers, *Navigation, *Forecasting, Statistical methods, Probability, Ice jams, Data collections, Hydrologic data.
Identifiers: USSR.

The statistical methods used to predict ice breakup and freezing of rivers in the USSR are outlined. The length of the observational records for the major navigable rivers of the European USSR is at least 60 years in most cases. The records for Siberian rivers were shorter, but for the waterways, except in the Arctic, they were at least 40 years and in West Siberia and for the Amur, 50 years. Nearly all stations on the rivers of the European USSR with records of less than 40 years, and on rivers in the Asiatic USSR with records of less than 30 years, are located on small, intermittently navigable rivers. Thus, fairly limited samples served as initial material for the construction of integral probability curves. The accuracy in the determination of dates of different integral probability is characterized by a probable error close to observation accuracy and a limiting error at a 5 per cent significance level close to the corresponding error in the computation of the average date. (Knapp-USGS)

SNOW STORAGE DISTRIBUTION IN RIVER BASINS,
V. V. Rakmanov.
Transl from Trudy Gidromet. Tsentra, No 37, p 52-69, 1969. Soviet Hydrology: Selected Papers, Issue No 1, p 49-63, 1969. 15 p, 5 fig, 7 tab, 8 ref.

Descriptors: *Snow cover, *Snowpacks, *Water yield, *Water storage, *Probability, Statistical methods, Distribution patterns, Snow surveys, Runoff forecasting.
Identifiers: *USSR, Snow cover distribution.

Methods of computing the total snow storage distribution in river basins are described. They can be used in any region if the network of snow survey points is adequate and permits determination of the basin distribution of storage and if it is possible to select appropriate typical local distribution curves. The use of typical curves to describe snow storage distribution is entirely justified only for relatively small basins or those areas of larger basins where the average snow storage at separate points differs little from the total average value in the basin. For a large basin, snow storage distribution depends not only on its variation over each given area, but also on the variation in average snow storage in areas of the basin relative to their total average value in the basin. HEAT TRANSFER COEFFICIENT IN WATER BODIES WITH LIMITED FLOWAGE DURING SUMMER HEATING,
K. I. Rossinskiy, and M. P. Kravtsova.
Transl from Trudy Gos. Gidrol. Inst-ta, No 162, p 205-220, 1969. Soviet Hydrology: Selected Papers, Issue No 1, p 27-38, 1969. 12 p, 5 fig, 2 tab, 9 ref.

Descriptors: *Heat transfer, *Lakes, *Turbulence, *Cold regions, Convection, Conduction, Heat flow, Mass transfer, Temperature, Mixing, Solar radiation.
Identifiers: USSR, Great Bear Lake (Canada).

In small bodies of water with active through-circulation, the basic heat transfer agent throughout the year is turbulent water flow. In deep water bodies with limited flowage, heat transfer occurs during different seasons and in different parts of the water bodies under the influence of different factors. At the onset of summer heating, until the surface layer temperature reaches 8 deg C, the transfer of heat occurs through the joint effect of convective and intensive mixing of waters due to the turbulence-producing effect of the wind. During the period from the spring breakup to spring isothermy, heat transfer occurs under the influence of free convection and mixing induced by the wind. During the period of isothermy, the main heat transfer processes are played by free convection. Observations made during the summers of 1964 and 1965 in Great Bear Lake (Canada) revealed that convective currents usually occupy considerable water depths, as deep as 225 m, whereas during cold years, when there is lesser heating, they extend to the very bottom, as deep as 450 m. WORKSHOP ON SNOW AND ICE HYDROLOGY.

Proceedings of the Workshop on Snow and Ice Hydrology, Colorado State University, Fort Collins, August 18-22, 1969; published by US National Committee for International Hydrological Decade, 1969. 142 p.

Descriptors: *Water resources development, *Snow management, *Hydrology, *Conferences, *International Hydrological Decade, Avalanches, Glaciers, Snowpacks, Snowfall, Streamflow forecasting, Runoff forecasting, Melting, Ablation, Regimen, Snow surveys, Remote sensing, Research and development.
Identifiers: Snow hydrology.

The primary objective of the Workshop was to improve communications among those from various professional backgrounds and geographical regions having a common interest in snow and ice. The state of the art of snow and ice hydrology was explored and an attempt was made to identify and define some of the major problems and possible solutions. Emphasis was placed on hydrologic relations of the seasonal snow cover. Much of the discussion was pertinent to both seasonal snow cover and perennial snow and ice. (Knapp-USGS)

WATER BALANCE OF SOME WARM DESERT PLANTS IN A WET YEAR,
Nevada Univ., Reno. Desert Research Inst.
N. Stark.
Journal of Hydrology, Vol 10, No 2, p 113-126, February 1970. 14 p, 5 fig, 1 tab, 7 ref. NSF Grant No GB 6681.

Descriptors: *Soil-water-plant relationships, *Deserts, *Water balance, *Water loss, *Wate

orage, Arid lands, Arid climates, Water supply, ainfall, Precipitation (Atmospheric), Soil water ovement, Recharge, Infiltration, Evaporation, ranspiration, Evapotranspiration, Air tempera- re, Humidity.
entifiers: Death Valley (Calif).

udies of the water balance on a hectare of avelly wash in northern Death Valley showed at in an exceptionally wet year, the plants can ob- in moisture from free soil water and the conden- tion of soil water vapor in March. In May, with gher soil temperature extremes, distillation and ndensation in the 20 to 40 cm soil zone provided ore than enough water to make up for the water ss from evapotranspiration. By June, the rate of ater loss and other physiological processes were eatly decreased. Distillation and condensation in ne did adequately supply transpiration water loss uring a cloudy, cool period. Transpiration of the ur dominant species based on grams of water lost er gram of dry weight varied from March through ne by species. Internal water stress correlated osely with transpiration rates. Diurnal increase in ternal moisture stress generally followed the ecrease in the transpiration rate in June. From larch 10 through June 10, input was 2.6 g/sq cm, vapotranspiration was 4.0 g/sq cm, and soil oisture loss was 1.0 g/sq cm. The difference etween soil moisture loss and evapotranspiration sses was 0.4 g/sq cm which is the result of mea- uring soil moisture outside of the root zone instead f within the root zone. VAPOTRANSPIRATION MEASUREMENT BY HLORIDE TRANSLOCATION,
gricultural Research Service, Reno, Nev. Soil and Vater Conservation Research Div.
.. S. Dylla, and D. M. Stuart.
ournal of Hydrology, Vol 10, No 2, p 185-192, eb 1970. 8 p, 2 fig, 3 tab, 7 ref.

escriptors: *Evapotranspiration, *Soil chemistry, Root zone, *Mass transfer, *Soil water move- ent, Chlorides, Saline water systems, Leaching, oil-water-plant relationships, Water chemistry, olutes.
dentifiers: Chloride translocation.

rofiles in evapotranspiration tanks were sampled t the start and end of the 1968 growing season to etermine chloride ion translocation into the top 0 cm of the soil by which seasonal evapotranspira- tion was estimated. Coefficients of variation between profile totals ranged from 0.11 to 0.21 for the profiles sampled in April and from 0.39 to 0.45 for profiles sampled in October. The lower variation in April is attributed to the pre-season leaching. The greatest increase in chlorides in the vegetated tanks occurred in the top 15 cm; however, there was significant increase in all sample increments down to 60 cm, which is about the depth of the meadow grass rooting. Variability of total chlorides in adjacent soil profiles of vegetated surfaces makes the method of determining seasonal or long-term evapotranspiration from chloride translocation only a rough estimate. To obtain valid mean chloride profiles from which good evapotranspiration estimates could be expected would require very extensive soil sampling and nonchanging groundwater quality below the root zone during the measuring interval or season. (Knapp-USGS)

SOIL MOISTURE TENSION TRANSIENTS ASSOCIATED WITH EVAPOTRANSPIRATION FROM A WATER TABLE,
Agricultural Research Service, Fresno, Calif. Field Station.
W. C. Bianchi, and Rhys Tovey.
Soil Science Society of America Proceedings, Vol 34, No 3, p 496-501, May-June 1970. 6 p, 9 fig, 2 tab, 9 ref.

Descriptors: *Lysimeters, *Moisture tension, *Evapotranspiration, *Unsaturated flow, *Root zone, Diffusivity, Capillary fringe, Water table, Tensiometers, Soil water movement, -Water balance, Instrumentation, Irrigation, Strain gages.
Identifiers: Straingage tensiometers.

Soil moisture tensions were recorded continuously in lysimeters containing a loam soil and a controlled water table. Seven strain gauge-pressure transducer-tensiometers were spaced from 20 to 110 cm above the 158-cm water table. The velocity at which the morning and evening soil moisture tension minimum and maximum progressed downward through the root zone and capillary fringe proved inconsistent with soil moisture flow theory. This was interpreted as showing that even at low tensions a decrease in the moisture film continuity between the soil and tensiometer bulb relative to that between the few roots in contact with the bulb, caused the measurement to be biased toward the tensions associated with the root system. When the minimum daily tension exceeded 400 cm, soil-bulb continuity was lost and, as a result, the characteristic wave form of daily evaporation (ET) demand was also lost. By placing the tensiometers in the capillary fringe where roots are absent, they could record the changing demands of ET on the capillary fringe. A method was tested for estimating water table uptake from a diffusivity based on the velocity of propagation of tension waves induced into the soil profile by daily ET and associated diurnal gradient changes. EVAPORATION AND CONDENSATION ON BARE SOIL UNDER IRRIGATION IN THE EAST CENTRAL GREAT PLAINS,
Nebraska Univ., Lincoln. Dept. of Horticulture and Forestry.
Norman J. Rosenberg.
Agronomy Journal, Vol 61, No 4, p 557-561, July-August 1969. 3 tab, 27 ref. OWRR Project A-001-NEB.

Descriptors: *Evaporation, *Condensation, *Advection, *Irrigation effects, *Great Plains, Evapotranspiration, Dew, Rainfall, Environmental effects, Irrigation, Drying, Irrigated land, Semiarid climates, Nebraska, Heat transfer, Lysimeters.
Identifiers: *Net radiation, *Oasis effect, *Bare soil, *Potential evaporation, *Nocturnal evaporation.

Precision weighing lysimeters were used during the summer and fall of 1966 to measure evaporation from bare Sharpsburg sandy clay loam at Mead, Nebraska. Maximum daily evaporation was about 9 mm during August and about 3 mm during October. On days following a rain the evaporation from bare soil was in close agreement with available total net radiation, but on days following irrigation of only the lysimeters and buffer area the E/Rn was significantly greater than unity. This would indicate a strong oasis effect with a large advectional contribution of energy. From 10 to 50% of the total daily evaporation was nocturnal, the higher proportions occuring during the fall. Dew was detected on most mornings and the maximum deposition measured was about 0.5 mm. Both the Penman and van Bavel methods of estimating evaporation varied from lysimetrically measured evaporation by 3 to 50% on a daily basis, but the Penman method yielded lower estimates of bare soil evaporation. WINDS OVER SALTCEDAR,
Geological Survey, Lubbock, Tex.
T. E. A. Vay Hylckama.
Agricultural Meteorology, Vol 7, p 217-233, 1970. 17 p, 9 fig, 2 tab, 21 ref.

Descriptors: *Evapotranspiration, *Turbulence, *Wind velocity, *Tamarisk, Phreatophytes, Evapotranspiration control, Water yield improvement, Meteorology, Arizona, Consumptive use, Water loss.
Identifiers: Wind profiles.

An analysis of hourly wind speeds above and within a stand of saltcedar near Buckeye, Arizona, reveals that in 90% of all observed cases, the wind profiles above the stand can be represented by a simple logarithmic equation. The roughness length (disregarding zero displacement), varies with a stability ratio similar to Richardson's number. The friction velocity, depends on the wind speeds above the vegetation. Within the thickets there is considerable turbulence, and irregular wind inversions occur during daylight hours. The results are important for estimating water losses by evapotranspiration by either the energy-budget or the mass-transfer formulae. (Knapp-USGS)

ENERGY BALANCE ESTIMATES OF EVAPOTRANSPIRATION,
Oregon State Univ., Corvallis. Dept. of Forest Climatology.
Lloyd W. Gay.
In: Water Studies in Oregon; Oregon State University Water Resources Research Institute Fall Quarter 1969 Seminar WR012.69 Corvallis, p 17-39, January 1970. 23 p, 11 fig, 1 tab, 16 ref.

Descriptors: *Evapotranspiration, *Energy budget, *Microclimatology, Microenvironment, Soil-water-plant relationships, Water yield improvement, Forests, Wetlands, Deserts, Grasslands.
Identifiers: Pacific Northwest.

The role of vegetation in the evapotranspiration process is described to show the importance of this process in the establishment of a surface energy balance. Application of energy balance theory was demonstrated by the field experiments carried out over two contrasting sites, a pumice desert and a lush wet meadow in the Pacific northwest. Analysis to two similar days indicated that the wet meadow evaporated 5.1 mm (0.2 in) for the period 0730-1930 PDT; this was about six times the evaporation estimated over the pumice desert for the same

period. The lack of water available for vaporization at the pumice site caused major differences in the surface energy balances of the 2 sites. The resulting microclimate effects are quite important in the zone where plant growth would take place near the surface. (See also W70-08475). (Knapp-USGS)

A NOTE ON THE RECOGNITION, CAUSE, AND POSSIBLE GEOLOGIC IMPORTANCE OF GROUNDWATER MICROFLOW SYSTEMS IN ALLUVIAL-CHANNEL BED-FORMS,
Wisconsin State Univ., Oshkosh. Dept. of Geology; and North Dakota Univ., Grand Forks. Dept. of Geology.
Samuel S. Harrison, and Lee Clayton.
North Dakota Academy of Science Proceedings, Vol 22, p 9396, 1968. 4 p, 2 fig, 1 ref.

Descriptors: *Sedimentary structures, *Surface-groundwater relationships, *Dunes, *Ripple marks, Channel morphology, Alluvial channels, Alluvium, Groundwater movement, Seepage.
Identifiers: Groundwater microflow systems.

Groundwater microflow systems in natural bed-forms were noted during experiments on sediment transport in laboratory flumes. Ripple bed-forms consisting of medium sand injected with dye showed incipient movement of the dye through the sand after an elapsed time of 5 minutes. Dye movement was greatest beneath the gently sloping upstream side of the bed-forms. Water from the stream channel enters the upstream side of the bed-forms, flows in a concave-upward arc downstream, and emerges at the crest of the bed-forms. Water which enters the stream bed less than roughly 1/2 wavelength in front of the bed-form crest flows in an arc upstream and emerges at the nearest crest. The microflow is caused by pressure variations from the hydrostatic on the surface of the bed-forms. The pressure on the bed-form surface is greatest in the low areas above the crests. (Knapp-USGS)

DERIVATION OF FORMULAE FOR VARIABLE LAG TIME,
New South Wales Univ., Kensington (Australia). School of Civil Engineering.
Arthur J. Askew.
Journal of Hydrology, Vol 10, No 3, p 225-242, Apr 1970. 18 p, 6 fig, 2 tab, 13 ref.

Descriptors: *Flood routing, *Time lag, Small watersheds, Flood forecasting, Hydrograph analysis, Hydraulics, Open channel flow, Discharge (Water), Floods, Equations, Mathematical studies.
Identifiers: Lag time formulae.

Formulae are developed which permit the computation of lag time for a catchment as a variable dependent on flood magnitude. Nonlinearity, as demonstrated by the variation in lag, differs little from catchment to catchment, and what difference there is can only be weakly related to the catchment's characteristics. A highly simplified analysis of the stream channels indicates that they are subject to a nonlinear hydraulic response of the same order of magnitude as that measured in the catchments as a whole. It is therefore suggested that the nonlinearity associated with the catchment areas is chiefly the result of that to be found in their channel systems. The absolute magnitude of lag time is highly correlated with catchment area and slope. This correlation leads to the development of three formulae for use with ungaged catchments which closely resemble those developed in the past for the estimation of a constant lag time. (Knapp-USGS)

BEHAVIOR OF ANNUAL FLOODS IN LIMESTONE BASINS IN PENNSYLVANIA,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
Elizabeth L. White, and Brian M. Reich.
Journal of Hydrology, Vol 10, No 2, p 193-198, Feb 1970. 6 p, 4 fig, 4 ref.

Descriptors: *Floods, *Surface-groundwater relationships, *Karst, *Pennsylvania, Hydrogeology, Aquifers, Limestones, Caves, Fissures (Geology), Geology, Springs, Small watersheds.
Identifiers: Mean annual flood.

The relations between flood data and watershed features were examined in small basins in Pennsylvania. The specific flood parameter used was the mean of the annual series of floods, which corresponds to the flood with a recurrence interval of 2.33 years. Extremely low mean annual floods occurred where there was extensive thick limestone above base level within the basin. The explanation is that storm excess waters enter the groundwater storage and then resurge slowly over the next few days. This results in lower floods for a given size of carbonate basin. DETERMINATION OF CHANNEL CAPACITY OF THE TUOLUMNE RIVER DOWNSTREAM FROM LA GRANGE, STANISLAUS COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
J. C. Blodgett, and Hugh T. Mitten.
US Geological Survey Open-file report, 1970. 38 p, 10 fig, 5 plate, 4 tab, 6 ref, 5 append.

Descriptors: *Floods, *Stage-discharge relations, Flood plains, *Backwater, *California, Flood control, Flood protection, Non-structural alternatives, Historic flood, Frequency analysis, Hydrologic data, Data collections, Profiles, Probability.
Identifiers: Modesto (Calif), Tuolumne River (Calif), Flood profiles, Flood frequencies, Inundation.

The adequacy of a 52-mile reach of the Tuolumne River, Calif. to carry flood flows is described in a channel capacity report based on records of streamflow, historical and computed flood heights, and recorded backwater conditions. Maps, photographs, profiles, cross-sections, stage-discharge relations, and a backwater probability curve, indicate the extent of flooding that has occurred and may be expected to occur in the future. The flood data may be used to define the primary flood-way, and minimize vulnerability to flood damages by control of flood plain use through formulation of flood plain regulations, zoning regulations, and building codes. The report is intended to assist individuals, industry, and government in the planning of recreational, waste disposal, and flood protection facilities. (Knapp-USGS)
W70-08237

FLOOD PROFILE STUDY, MORGAN CREEK, LINN COUNTY, IOWA,
Geological Survey, Iowa City, Iowa.
Harlan H. Schwob.
US Geological Survey Open-file report, May 1970. 16 p, 10 plate, 3 ref.

Descriptors: *Floods, *Iowa, *Flood plain zoning, *Profiles, Water levels, Stage-discharge relations, Flood protection, Flood plains, Water resources development, River basin development, Urbanization.
Identifiers: Cedar Rapids (Iowa), Linn County (Iowa), Morgan Creek (Iowa).

Profiles were computed for a large flood of Morgan Creek, Iowa under existing conditions and for a smaller flood for two assumed conditions of encroachment. Flood-plain management can benefit from this type of information during future expansion of the Cedar Rapids urban area. Morgan Creek is a small right-bank tributary of the Cedar River near the northwestern part of Cedar Rapids. The area drained at the mouth is 18.9 square miles--approximately two-thirds of which is in Linn County and the remainder, 6.71 square miles, is in Benton County. The land in the basin is gently rolling and is now virtually all used for agricultural purposes. Standard methods of step-backwater computation were used to define water-surface profiles for the larger flood discharge that defines the inundation level. (Knapp-USGS)

FUNDAMENTAL PRINCIPLES OF THE METHOD FOR COMPUTING MAXIMUM RUNOFF,
S. N. Kritskiy, and M. F. Menkel.
Trudy Gos. Gidrol. Inst-ta, No 162, p 3-17, 1969. Soviet Hydrology: Selected Papers, Issue No 1, p 1-10, 1969. 10 p, 3 fig, 1 tab, 7 ref.

Descriptors: *Reservoir design, *Streamflow forecasting, *Probability, River forecasting, Frequency analysis, Design flow, Design flood, Design standards, Statistical methods.
Identifiers: USSR.

The concept used as a theoretical basis of computations at the present stage in the USSR in climatology and hydrology is the concept of streamflow fluctuations as a random process. An estimate of the possible future maximum water discharges becomes definite only to the extent to which the discharge corresponds to its excess probability. All methods for computing maximum water discharge are based on an analysis of data on maximum runoff and the meteorological phenomena causing it as observed in the past. The criterion for determining maximum water discharge is the annual probability that this quantity will be exceeded. Information on fluctuations of maximum water discharge is limited for each individual river to the number of years during which hydrometric observations have been made. The reservoir design philosophy of the USSR is explained and reviewed. (Knapp-USGS)

FRESHWATER ECOLOGY IN THE MATO GROSSO, CENTRAL BRAZIL I. THE CONDUCTIVITY OF SOME NATURAL WATERS,
Westfield Coll, London (England). Dept. of Zoology.
J. Green.
Journal of Natural History, Vol 4, p 289-299, 1970. 6 fig, 7 tab, 11 ref.

Descriptors: *Conductivity, *Tropical regions, *Impact (Rainfall), *Precipitation (Atmospheric), *Runoff, Calcium, Water properties, Hydrologic cycle, Streams, Meanders, Percolation, Sodium.
Identifiers: *Brazil, *Mato grosso, Cerrado.

The conductivities of streams, meander lakes, rainfall, and runoff water were measured in a region of the Mato Grosso. The streams and meander lakes had low conductivities with one exception, which was subject to much evaporation. Rainfall water showed higher conductivities than streams, and large variations, even during a single rainfall. The conductivities of later rains decreased relative to earlier rains, and convectional rains showed less variation than passing fronts. Runoff water passing through vegetation or cleared sites had higher conductivity than the rainfall water, indicating ions were added from the soil and plants, and this was accompanied by short-term fluctuations in the conductivities of small streams. Percolating water had lower conductivities, presumably due to loss of ions to the soil. Rainfall also had a high Ca to Na ratio and it was estimated that over a 2 month period it supplied the region with at least 4 kilograms of Ca per hectare. The probable sources of the ions in the rainwater are considered, and it is felt that wide spread burning during the dry season may be a major source because of the dispersion of large amounts of ash into the atmosphere. The hydrological cycle in the Mato Grosso probably effects a considerable amount of mineral recycling in plants and soils. (Casey-Arizona)

NUMERICAL SIMULATION OF WATERSHEDS USING PHYSICAL SOIL PARAMETERS,
Texas Univ., Austin; and Texas Tech Univ., Lubbock.
Walter L. Moore, and Bill J. Claborn.
13th Congress International Association for Hydraulic Research Proceedings, Vol 1, p 211-219, Aug-Sept 1969. 9 p, 4 fig, 9 ref.

Descriptors: Water resources development, Flow rates, Reservoirs, Soil moisture, Stream gages, *Streamflow records, Evapotranspiration, Digital computers, Simulation, Overland flow, *Watersheds (Basin), Hydrographs, *Runoff, Groundwater movement, Computer programs, Rainfall, Evaporation, Infiltration, Depression storage.
Identifiers: Stream gaging station, *Hydrologic models, Soil moisture movement, Pore size, *Stanford Watershed Model.

The best possible information on the amount and timing of streamflow is necessary for planning water resource developments. Limited information is available from stream gaging data, but information is needed at other points where no records, or records of very short duration, are available. Developing reliable and practical methods of hydraulic simulation offers one of the most promising methods for obtaining the necessary additional information. The advent of high-speed digital computers employing numerical models of the entire runoff process for a watershed has made hydrologic simulation feasible. One of the first and most successful simulation programs, the Stanford Watershed Model, is discussed. Revisions to the model have been made at the University of Texas at Austin to make the simulation of infiltration and soil moisture movement correspond more closely to the physical processes. In the modified model, the parameters representing the watershed are related to the physical quantities, and it is hoped that they can be related to measurable characteristics of the watershed. (USBR)

INDIRECT DETERMINATION OF SYNTHETIC RUNOFF,
Agricultural Research Service, Chickasha, Okla.
Donn G. DeCoursey, and Edward H. Seely.
13th Congress International Association Hydraulic Research Proceedings, Vol 1, p 123-131, Aug-Sept 1969. 9 p, 3 fig, 1 tab, 6 ref.

Descriptors: *Synthetic hydrology, *Runoff, Runoff forecasting, Land use, Rainfall, *Rainfall-runoff relationships, Evaporation, Hydrology, Watershed management, Watersheds (Basins), *Mathematical models.
Identifiers: Stochastic models, Deterministic model, *Hydrologic models, Computer applications.

Synthetic sequences of daily storm runoff have been generated for a 1110-acre watershed in Texas. The system is used to generate the runoff and is composed of deterministic and stochastic elements. The watershed model--a function of land use, soil moisture, and evaporation--is deterministic in that a functional relationship exists between the inputs to the model and the model response. The model is not entirely deterministic because a probabilistic element fitted to the unexplained variance of the watershed response is included. Inputs to the system are stochastic and consist of daily rainfall and evaporation. A 2-state Markov chain of transition probabilities was used to calculate the occurrence or nonoccurrence of rainfall. The amount of rainfall was uncorrelated with previous rainfall or length of dry period. Monthly evaporation was correlated with the previous month's evaporation and present month's rainfall. Various statistical tests verified the adequacy of the methods used. Several synthetic sequences of runoff were generated with the watershed in 2 different land uses. The system can be used to study the relationship between land use, rainfall regime, length of record, and flood frequency. (USBR)

Witwatersrand University Hydrological Research Unit Report No 4/69, December 1969. 66p, 34 fig, 38 tab, 8 append.

Descriptors: *Flood forecasting, *Flood routing, *Design flood, Rational formula, Routing, Time lag, Unit hydrographs, Rainfall-runoff relationships, Synthetic hydrology, Depth-area-duration analysis, Design storm.
Identifiers: *South Africa.

Design floods were calculated for most South African streams. For catchments up to about 5 square miles in area the conventional method of determining the peak discharge is by use of the Rational Formula. For determination of design output from catchments from 5 sq mi to about 2000 sq mi in area the unitgraph approach is recommended. Unitgraphs should not be synthesized for catchments larger than about 2000 sq mi. Although the design storm should be synthesized for the problem catchment as a whole, the catchment should then be subdivided into convenient subcatchments, none exceeding 2000 sq mi in area, and unitgraphs synthesized for each. Application of the appropriate parts of the effective design storm to these unitgraphs yields a flood hydrograph at the mouth of each sub-catchment. These separate flood hydrographs must then be lag-routed in turn to the problem site. (Knapp-USGS)
W70-08464

PRECIPITATION, STREAMFLOW, AND MAJOR FLOODS AT SELECTED SITES IN THE GILA RIVER DRAINAGE BASIN ABOVE COOLIDGE DAM, ARIZONA,
Geological Survey, Washington, D.C.
D. E. Burkham.
For sale by Superintendent of Documents, US Government Printing Office, Washington, DC 20402. Price $0.50. US Geological Survey Professional Paper 655-B, 1970. 33 p, 23 fig, 5 tab,22 ref.

Descriptors: *Streamflow, *Rainfall-runoff relations, *Floods, *Arizona, Discharge (Water), Evapotranspiration, Phreatophytes, Surface waters, Climates, Precipitation (Atmospheric), Regime, Alluvial channels, Channel morphology.
Identifiers: Gila River Phreatophyte Project.

The Gila River Phreatophyte Project is a water-budget study to measure evapotranspiration from a 15-mile reach of the Gila River flood plain above Coolidge Dam in southeastern Arizona. Its principal purpose is to determine how much the water yield of the project area can be increased by replacing deep-rooted nonbeneficial woody plants with shallow-rooted beneficial grasses. There has been a fluctuating decline in annual precipitation and an almost continual decline in annual runoff since 1920. The decrease in precipitation has been mainly during the winter (November through April) and has resulted in a lower incidence of major floods. Major floods occurred in nine winters in the period 1891-1916, but only one major flood (December 1965) occurred in the period 1917-65. No significant progressive decrease has occurred in the ratio of runoff to a given amount of precipitation since 1920, nor has there been a progressive increase in the streamflow losses from the Gila River in Safford Valley. (Knapp-USGS)

MEANDERING OF THE ARKANSAS RIVER SINCE 1833 NEAR BENT'S OLD FORT, COLORADO,
Geological Survey, Denver, Colo.
Frank A. Swenson.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter B, US Geological Survey Professional Paper 700-B, p B210-B213, 1970. 4 p, 4 fig, 1 ref.

Descriptors: *History, *Meanders, *Alluvial channels, *Colorado, Erosion, Flood plains, Rivers, Surveys.
Identfiers: *Bent's Old Fort (Colo), *Arkansas River (Colo), National Historical Monuments.

Bent's Old Fort, constructed on the Santa Fe Trail in 1883 in southeastern Colorado, has been established as a National Historical Monument. The U.S. National Park Service is interested in determining the relative position of the fort, at the time it was occupied, to the meandering Arkansas River. Available data indicate there has been relatively little shift in the meanders of the river at this location. (Knapp-USGS)

SYNTHETIC UNITGRAPHS FOR SOUTH AFRICA,
University of the Witwatersrand, Johannesburg (South Africa). Dept. of Civil Engineering.
P. A. Pullen.
Witwatersrand University Hydrological Research Unit Report No 3/69, December 1969. 201 p, 54 fig, 36 tab, 53 ref, 1 append.

Descriptors: *Unit hydrographs, *Routing, *Rainfall-runoff relationships, Duration curves, Depth-area-duration analysis, Hydrograph analysis, Synthetic hydrology, Data collections, Hydrologic data, Flood routing, Flood forecasting, Streamflow forecasting, Runoff forecasting.
Identifiers: *South Africa.

A method was developed for estimating the duration of excess rain and for deriving the unitgraph when the catchment rainfall that caused a significant flood rise is not measured. Nearly 600 flood events at 96 streamgages well spread over South Africa were analyzed by this method. Standard unitgraphs for each of the 96 selected catchments are compiled for a unitgraph library. Basin lags, estimated from the library unitgraphs, were correlated with physiographic characteristics represented in terms of a catchment index. South Africa was divided into nine zones displaying distinctive lag-physiography relationships. One-hour unitgraphs were derived from the library unitgraphs. Generalized dimensionless one-hour unitgraphs were calculated for each of the nine zones. Diagrams depicting the nine dimensionless one-hour unitgraphs are given as well as tabulations of the unitgraphs and the dimensionalizing parameters. (Knapp-USGS)

QUANTITY AND CHEMICAL QUALITY OF LOW FLOW IN CIBOLO CREEK, TEXAS, MARCH 4-8, 1968,
Geological Survey, Austin, Tex.
William E. Reeves, and Harvey L. Kunze.
Texas Water Development Board Report 112, April 1970. 16 p, 3 fig, 3 tab, 4 ref.

Descriptors: *Low flow, *Water quality, *Texas, Sampling, Streamflow, Discharge (Water), Water chemistry, Water analysis, Data collections, Hydrologic data, Hydrogeology, Water pollution sources, Sewage, Sewage effluents.
Identifiers: Cibolo Creek (Tex).

The changes in quantity and inorganic chemical quality of base flow of Cibolo Creek, Texas, in the reach from the stream-gaging station at mile 89.6, downstream to a point 2.5 miles upstream from the mouth are described. The investigation was made during a period when evapotranspiration was at a minimum. Discharge increased in a downstream direction, from no flow at about mile 88 to 67.4 cfs at mile 2.5. Dissolved-solids concentrations also increased in a downstream direction throughout the reach. (Knapp-USGS)

QUANTITATIVE MORPHOLOGY OF THE DRAINAGE BASIN IN SEMI-ARID ENVIRONMENT,
Central Arid Zone Research Inst., Jodhpur (India).
Bimal Ghose, S. Pandey, and S. Singh.
Annals of Arid Zone, Vol 8, No 1, p 37-44, March 1969. 14 fig, 4 tab, 7 ref.

Descriptors: *Streams, *Basins, *Geologic mapping, *Lithification, Geological surveys, Arid lands, Geomorphology, Hydrogeology, Drainage density, Channel morphology.
Identifiers: *Bifurcation ratio, *Stream order, *India, *Rajasthan desert, *Drainage basins, Stream gradient, Relief ratio, Constant channel maintenance, Stream frequency, Basin order.

Twelve drainage basins in a semi-arid areas were randomly selected and studied using aerial maps. The basins were divided into 3 lithological groups - granite, phyllite-schist-quartzite, and sandy older alluvium. Fourteen geomorphic characteristics were determined for each group. A line drawing of the topography of each basin is included. The number of streams in a given basin decrease with increase in stream order; main stream length increases with increase in stream order. However the total lengths of each order are inversely related to the order. Stream length ratios did not vary with lithology but basin area ratios did. The average values of most of the geomorphic characteristics did vary with lithology. (Casey-Arizona)

GRAVITY INVESTIGATION OF THE WATER-BEARING STRATA IN SWAN VALLEY, MONTANA,
Montana Univ., Missoula; and Montana Water Resources Research Center, Bozeman.
Gary W. Crosby.
Completion Report, (1970). 2p. OWRR A-023-MONT (1).

Descriptors: *Gravity studies, *Groundwater, Water-bearing strata, Montana.
Identifiers: Swan Valley (Montana).

The Swan Valley and contiguous portions of the Swan and Mission Ranges have been covered with 325 gravity stations for a spacing density of one measurement per 1.25 sq. mi. Gravity data have been processed through the computer and their Bouguer anomalies have been calculated and plotted. There is considerable irregularity in the gravity field, particularly at the south end. Inferring an average porosity of 18 per cent from density data, there are 27 cubic miles of pore space. If a specific yield of 0.5 is assumed, there are 46,700,000 acre-feet recoverable, or about 1.2 X 10 to the 13th power gallons that may be produced. It is believed that these figures are conservative. (Holje-University of Montana)

GEOLOGY AND GROUNDWATER RESOURCES OF SALEM COUNTY, NEW JERSEY,
Geological Survey, Trenton, N.J.
Jack C. Rosenau, Solomon M. Lang, George S. Hilton, and James G. Rooney.
New Jersey Division Water Policy and Supply Special Report No 33, 1969. 142 p, 21 fig, 7 tab, 25 ref, append.

Descriptors: *Water resources, *Groundwater, *Aquifers, *Saline water intrusion, *New Jersey, Water supply Withdrawal, Water yield, Water quality, Surveys, Water levels, Water utilization, Geology, Hydrologic data, Data collections, Hydrogeology.
Identifiers: Salem County (N J).

The Potomac Group and Raritan and Magothy Formations contain the most productive aquifers in Salem County, N.J. These aquifers are hydraulically connected and form a single hydrologic unit or aquifer system. Reported yields of wells tapping this system range up to 860 gpm. The highest yields commonly occur near the Delaware River. A decline in water levels resulted from heavy pumpage, and has created the danger of salt-water encroachment into the aquifer from downdip areas where the aquifer already contains saline water. Local chloride concentrations are as high as 2,057 ppm. Use of groundwater in Salem County in 1964 averaged 12.28 mgd or nearly 200 gpd per person. Industrial use was 5.33 mgd and use for public supply was 2.74 mgd. Irrigation, which has become increasingly important in recent years accounted for 2.14 mgd. Average total summer use of groundwater---approximately 17.7 mgd---was considerably higher than the yearly average. (Knapp-USGS)

Descriptors: *Groundwater movement, *Hydraulic models, Model studies, Soil water movement, Infiltration, Saturated flow, Leaching.
Identifiers: Blotting paper models.

To demonstrate water flow in a cross-sectional model, use can be made of a heavy blotting paper. This material is easily cut into any shape, lines can be drawn on it, and samples can be taken out. The sheets of blotting paper, forming the model, are hung vertically, the flow is introduced by saturated sheets placed vertically or horizontally as required. Simulation of infiltration, saturated flow and leaching is described. (Knapp-USGS)

Water Resources Bulletin, Vol 6, No 3, p 424-438, May-June 1970. 15 p, 8 fig, 13 ref.

Descriptors: *Groundwater movement, *Hydrogeology, *Unsteady flow, *Mathematical studies, *Reviews, Equations, Darcys law, *Analytical techniques, Dupuit-Forchheimer theory, Steady flow, Laplaces equation, Numerical analysis.
Identifiers: Unsteady groundwater flow.

The basic theories and fundamental assumptions usually employed in the solution of unsteady groundwater flow problems are reviewed critically. The best known method of analysis for such problems is based on the Dupuit-Forchheimer approximation and leads to a nonlinear parabolic differential equation which is generally solved by linerization or numerical methods. The accuracy of the solution to this equation can be improved by use of a different approach which does not employ the Dupuit-Forchheimer assumption, but rather is based on a seminumerical solution of the Laplace equation for quasi-steady conditions. The actual unsteady process is replaced by a sequence of steady-state conditions, and it is assumed that the actual unsteady flow characteristics during a short time interval can be approximated by those associated with 'average' steady state flow. The Laplace equation is solved by a semidiscretization method according to which the horizontal coordinate is divided into subintervals, while the vertical coordinate is maintained continuously. The proposed method is applied to a typical tile drainage problem, and, based on a comparison of calculated results with experimental data, the method is evaluated and practical conclusions regarding its applicability are advanced. HYDROGEOLOGY OF THE UPPER SILVER BOW CREEK DRAINAGE AREA, MONTANA,
Montana Bureau of Mines and Geology, Butte.
Maxwell K. Botz.
Available from the Clearinghouse as PB-193 025, $0.65 in microfiche; paper copy available from Montana Bureau of Mines and Geology, Butte, $0.35. Montana Bureau of Mines and Geology Bulletin 75, September 1969. 32 p, 6 fig, 10 tab, 2 plate, 22 ref. OWRR A-012 MONT (1).

Descriptors: *Water resources, *Groundwater, *Hydrogeology, *Montana, Alluvium, Aquifers, Water supply, Water yield, Water quality, Recharge water, Groundwater movement.
Identifiers: Silver Bow Creek (Montana).

Geologically, the Upper Silver Bow Basin, Montana is entirely within the Boulder batholith. Granitic rocks and alluvium derived from their weathering are, by far, the most abundant geological materials in the area. A 23 square mile alluvial filled valley south of Butte is the principal aquifer in the area. Alluvium in most of the area will yield sufficient water for domestic and stock use and in selected areas will yield several hundred gallons per minute to wells. Fractured rock in many places yields sufficient water for domestic and stock use. Streams entering the alluvial valley are the principal source of groundwater recharge. About 440,000 acre-feet of groundwater is in storage within the upper 200 feet of saturated alluvium. Movement of groundwater in the alluvial aquifer is northward at a gradient of about 15 feet per mile. There has been little net change in the configuration of the water table in the last 55 years. Scattered data indicate little annual fluctuation of the water table. Water quality is generally good; and the water is of the calcium bicarbonate type. (Botz-Montana)

RECORDS OF WATER LEVELS AND CHEMICAL ANALYSES FROM SELECTED WELLS IN PARTS OF THE TRANS-PECOS REGION, TEXAS, 1965-68,
Geological Survey, Austin, Tex.
M. E. Davis, and J. D. Gordon.
Texas Water Development Board Report 114, April 1970. 49 p, 9 fig, 7 tab, 11 ref.

Descriptors: *Groundwater, *Texas, *Hydrologic data, *Water levels, *Water quality, Water yield, Saline water, Irrigation water, Salinity, Water chemistry, Water yield, Data collections, Leaching, Infiltration, Percolation.
Identifiers: Trans-Pecos region (Tex).

Current information on water levels and the chemical quality of water in selected wells in the Trans-Pecos area of Texas is presented. Much of the information was collected in the heavily developed Salt basin and is particularly useful in evaluating the effects of large scale groundwater development. A substantial part of groundwater pumped in the area is for irrigation, most of which is in the Salt basin. On the basis of acreage irrigation, pumping rates, power tests, and records of fuel consumption, about 128,000 acre-feet of water was pumped in the Salt basin in 1967. Of this amount, 105,000 acre-feet was pumped in the Dell City subarea. In general, the quality of groundwater within the Salt basin becomes increasingly more mineralized northward. In the Lobo Flats-Chispa subarea, the

water is low in dissolved solids but high in percent sodium, a condition that has reduced the permeability of the subsoil. The concentration of dissolved solids in the more heavily pumped part of the Dell City subarea now ranges from at least 1,550 mg/l to more than 6,000 mg/l. The water is usable for irrigation, however, largely because of the high permeability of the soils. (Knapp-USGS)

TRANSMISSIVITY AND STORAGE COEFFICIENT OF AQUIFERS IN THE FOX HILLS SANDSTONE AND THE HELL CREEK FORMATION, MERCER AND OLIVER COUNTIES, NORTH DAKOTA,
Geological Survey, Bismarck, N. Dak.
Mack G. Croft, and E. A. Wesolowski.
For sale by the Superintendent of Documents U.S. Government Printing Office, Washington, D.C. 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter B, US Geological Survey Professional Paper 700-B, p B190-B195, 1970. 6 p, 1 fig, 1 tab, 12 ref.

Descriptors: *Transmissivity, *Storage coefficient, *Aquifers, *North Dakota, Water resources, Stock water, Water wells, Artesian wells, Hydrogeology, Water yield, Permeability, Discharge (Water).
Identifiers: Mercer County (ND), Oliver County (ND), Fox Hills Sandstone, Hell Creek Formation.

Since 1963, about 100 flowing stock and domestic wells have been drilled into the Fox Hills Sandstone and the Hell Creek Formation in Mercer and Oliver Counties, N. Dak. Aquifer tests were made on about half of the wells. The values obtained for transmissivity range from 13 to 3,100 gallons per day per foot, and average 510 gallons per day per foot. An analysis of the potentiometric surface in the southwestern part of Mercer County indicates a transmissivity of about 1,400 gallons per day per foot. The values for permeability average 16 gallons per day per square foot. Data indicate storage coefficient values are between 0.0001 and 0.00001. The aquifer tests indicate that the wells have specific capacities that range from less than 0.1 to 0.6 gallon per minute per foot. (Knapp-USGS)

PRELIMINARY ANALYSIS OF RATE OF MOVEMENT OF STORM RUNOFF THROUGH THE ZONE OF AERATION BENEATH A RECHARGE BASIN ON LONG ISLAND, NEW YORK,
Geological Survey, Mineola, N.Y.
G. E. Seaburn.
For sale by the Superintendent of Documents U.S. Government Printing Office, Washington, D.C. 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter B, US Geological Survey Professional Paper 700-B, p B196-B198, 1970. 3 p, 3 fig, 1 tab, 2 ref.

Descriptors: *Artificial recharge, *Unsaturated flow, *Infiltration, *New York, Soil water movement, Groundwater movement, Storm runoff, Urbanization, Cities, Pit recharge.
Identifiers: Long Island (NY).

A study of recharge basins on Long Island has provided information on the rate of movement of water through the zone of aeration. Pertinent data were collected during 38 storms from a basin in central Nassau County, where the depth to the water table is 35 feet below the bottom of the basin. In this basin the apparent downward rate of movement averaged 5.0 feet per hour; it ranged from an average of 3.0 feet per hour for storms in November through March to an average of 6.0 feet per hour for storms in April through October. (Knapp-USGS)
W70-08486

GROUNDWATER INFLOW TOWARD JORDAN VALLEY FROM UTAH VALLEY THROUGH VALLEY FILL NEAR THE JORDAN NARROWS, UTAH,
Geological Survey, Salt Lake City, Utah.
R. W. Mower.
For sale by the Superintendent of Documents US Government Printing Office, Washington, D.C. 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter B, US Geological Survey Professional Paper 700-B, p B199-B202, 1970. 4 p, 3 fig, 4 ref.

Descriptors: *Groundwater movement, *Alluvium, *Aquifers, *Utah, Hydraulic conductivity, Permeability, Transmissivity, Water levels, Surveys, Seismic studies, Electrical resistance, Geophysics, Investigations.
Identifiers: Valley-fill alluvium, Utah Valley.

About 2,500 acre-feet of groundwater annually is moving generally northward from Utah Valley toward Jordan Valley through unconsolidated valley fill near the Jordan Narrows, Utah. The computation of underflow was made at a section in which the saturated fill averages about 125 feet in thickness and is between 2,700 and 4,000 feet wide. The fill consists of sediments ranging from clay to coarse gravel in size, and it has an average hydraulic conductivity of about 3,200 cubic feet per day per square foot. Underlying and bounding the fill on the east and west sides of the narrows are semiconsolidated or consolidated rocks of low average hydraulic conductivity through which there is little underflow. THE RELATIONSHIP BETWEEN SURFACE WATER AND GROUNDWATER IN SHIP CREEK NEAR ANCHORAGE, ALASKA,
Geological Survey, Anchorage, Alaska.
John B. Weeks.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter B, US Geological Survey Professional Paper 700-B, p B224-B226. 3 p, 3 fig, 1 tab, 4 ref.

Descriptors: *Surface-groundwater relationships, *Recharge, *Aquifers, *Alaska, Alluvial channels, Glacial drift, Alluvium, Groundwater basins, Bank storage, Base flow, Discharge (Water), Seepage.
Identifiers: Anchorage (Alaska).

Ship Creek drainage basin is an important recharge area for the Anchorage artesian aquifer. Discharge records show Ship Creek loses an average of 25 cfs in the recharging area and gains about 22 cfs in the reach below the recharge area. A water-budget analysis demonstrates that of this gain at least 11 cfs is groundwater return flow from the recharge area. (Knapp-USGS)
W70-08492

PRAIRIE POTHOLES AND THE WATER TABLE,
Geological Survey, Denver, Colo.
C. E. Sloan.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter B, US Geological Survey Professional Paper 700-B, p B227-B231, 1970. 5 p, 6 fig, 1 tab, 3 ref.

Descriptors: *Surface-groundwater relationships, *Potholes, *Grasslands, *Water table, *Water level fluctuations, Water quality, Aquifers, Groundwater movement, North Dakota, Glacial drift, Lakes.
Identifiers: Prairie Potholes.

Prairie potholes, or sloughs, are water-holding depressions of glacial origin that occur in the prairies of the northern conterminous United States and southern Canada. The water table in the prairie-pothole region is a shallow surface that is a subdued image of the general topography. In detail, however, small variations in topography are not reflected, and in cross sections the water table is almost a straight line linking pothole water surfaces. Salinity and permanence of contained water differ widely among potholes and are influenced by groundwater flow which, in turn, is partially dependent on the configuration of the water table surrounding the pothole. Groundwater inflow, throughflow, and outflow result when the adjacent water table is correspondingly high, intermediate, and low. Relative permanence and salinity increase or decrease as net groundwater movement ranges from inflow to outflow. (Knapp-USGS)
W70-08493

2G. Water in Soils

USING SOIL MAPS TO DELINEATE FLOODPLAINS IN A GLACIATED LOW-RELIEF LANDSCAPE,
Wisconsin Univ., Madison. Dept. of Soil Science.
Dale E. Parker, Gerhard B. Lee, and Douglas A. Yanggen.
Journal of Soil and Water Conservation, Vol 25, No 3, p 96-99, May-June 1970. 4 p, 3 fig, 2 tab, 6 ref.

Descriptors: *Mapping, *Flood plains, *Aerial photography, *Soil surveys, Floods, Drainage, Soil water, Alluvium, Soil types, Soil investigations, Soil-water-plant relationships.
Identifiers: Flood plain mapping.

Floodplain boundaries determined by engineering methods were superimposed on detailed soil maps along two reaches of the Root River watershed in southeastern Wisconsin. A comparison of the predicted flood boundaries with soil boundaries showed that alluvial soils are subject to frequent flooding. In addition, other soils adjacent to or connected with the alluvial bottomlands were susceptible to flooding in varying degrees. The most poorly drained soils were, in general, the most likely to flood. (Knapp-USGS)
W70-08183

EFFECT OF ANTECEDENT SOIL WATER ON PRESEASON RAINFALL STORAGE IN A SLOWLY PERMEABLE IRRIGATED SOIL,
Agricultural Research Service, Bushland, Tex. Southwestern Great Plains Research Center.
J. T. Musick.
Journal of Soil and Water Conservation, Vol 25, No 3, p 99-101, May-June, 1970. 3 p, 3 fig, 1 tab, 6 ref.

Descriptors: *Infiltration, *Water storage, *Soil water, *Antecedent precipitation, Rain-fall-runoff relationships, Permeability, Irrigation, Texas, Water levels, Storage coefficient, Soil-water-plant relationships, Water conservation.
Identifiers: Antecedent soil water.

Preseason rainfall storage declined from the 30-percent to 50-percent level when the soil profile was dry after harvest to less than 10 percent when the soil was wet. This emphasizes the importance of an early irrigation cutoff date (not later than early grain filling) to largely deplete soil moisture before

harvest and provide storage capacity for expected preseason rainfall in the Southern High Plains, Texas. (Knapp-USGS)

EVALUATION OF THE INTRINSIC-PENETRABILITY AND -DIFFUSIVITY CONCEPTS TO PREDICT HORIZONTAL INFILTRATION IN POROUS MEDIA,
California Univ., Riverside. Department of Soils and Plant Nutrition.
M. A. Mustafa, J. Letey, and C. L. Watson.
Soil Science Society of America Proceedings, Vol 34, No 3, p 369-372, May-June 1970. 4 p, 5 fig, 2 tab, 16 ref.

Descriptors: *Soil water movement, *Diffusivity, *Infiltration, *Wettability, Surface tension, Organic matter, Surfactants, Wetting, Laboratory tests, Organic compounds, Viscosity.
Identifiers: *Water-repellent soils.

Horizontal infiltration of nine organic liquids and 0.01N calcium sulfate into glass beads and wettable and water-repellent soils was conducted to study the concepts of intrinsic penetrability and diffusivity. The concepts were found to apply to the two wettable porous media and all liquids considered. The concepts apply to the organic liquids but not to the 0.01N calcium sulfate in the water-repellent medium. (Knapp-USGS)

MEASUREMENT OF THE TOTAL SUCTION OF SOILS BY A THERMISTOR PSYCHROMETER,
Purdue Univ., Lafayette, Ind. Dept. of Agronomy.
B. D. Kay, and Philip F. Low.
Soil Science Society of America Proceedings, Vol 34, No 3, p 373-376, May-June 1970. 4 p, 5 fig, 15 ref.

Descriptors: *Soil moisture meters, *Temperature, *Humidity, *Vapor pressure, Instrumentation, Osmosis, Thermodynamics, Osmotic pressure, Calibrations, Clays, Soils.
Identifiers: *Thermistor physchrometer.

A detailed description of a thermistor psychrometer is presented. The psychrometer depends on differential cooling due to unequal evaporation rates of water droplets suspended from matched thermistors which are located above the sample and reference. The resulting difference in resistance between the thermistors is measured by a Wheatstone bridge and referred to a calibration curve for the determination of the total suction of the sample. Results obtained by the psychrometer on a Brookston silt loam are shown to agree with those obtained by a pressure plate. However, results obtained by the phychrometer on a pure clay-water system are shown to differ from those obtained by a tensiometer. A possible reason for this difference is given. (Knapp-USGS)

ANALYSIS OF RADIAL, STEADY-STATE SOLUTION, AND SOLUTE FLOW,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.; and Illinois Univ., Urbana. Dept. of Soil Physics.
Frank D. Whisler, Arnold Klute, and Richard J. Millington.
Soil Science Society of America Proceedings, Vol 34, No 3, p 382-387, May-June 1970. 6 p, 13 fig, 15 ref.

Descriptors: *Soil water movement, *Root zone, Diffusion, Soil-water-plant relationships, Hydraulic conductivity, Soil moisture, Moisture tension, Moisture uptake.
Identifiers: Flow to roots, Radial flow.

Equations which describe steady-state solution and solute flow to a root were solved in a seminumerical-analytical manner subject to fixed tensions and concentrations at the inner and outer radial boundaries. Tension, solution content, and solute concentration profiles are shown for conductivity and diffusion coefficients which vary with saturation. Fluxes of solution and solute are calculated for several boundary conditions. Limiting solution fluxes are predicted. (Knapp-USGS)

PREDICTING MOISTURE DISTRIBUTIONS IN REWETTED SOILS,
Department of Agriculture, Ottawa (Ontario). Soil Research Inst.
W. J. Staple.
Soil Science Society of America Proceedings, Vol 34, No 3, p 387-392, May-June 1970. 6 p, 8 fig, 14 ref.

Descriptors: *Infiltration, *Percolation, *Wetting, *Hysteresis, *Soil water movement, Hydraulic conductivity, Unsaturated flow, Soaking, Diffusivity, Drying, Laboratory tests, Capillary action, Soil physical properties.
Identifiers: Soil rewetting.

Computed and measured soil moisture distributions were compared during second and third cycles of infiltration and redistribution. In order to obtain acceptable agreement, the hydraulic conductivity had to be reduced to about one-half of the value used in the first cycle for freshly packed soil. One method was to correct the conductivity by trial and error. The other was to measure the conductivity of the soil after it had been carried through an initial wetting and drying cycle. Hysteretic effects on rewetting were minimized by adding sufficient water to the partially dried soil to bring it back to its initial wetted condition. The independent domain theory was found satisfactory for providing wetting tension data during the brief infiltration period. Modified tension scanning curves for drying were used in second-cycle computations for clay soil but the original curves for freshly packed columns were used for sand. (Knapp-USGS)

HYDRAULIC CONDUCTIVITY OF AN ISOTROPICALLY COMPRESSED SOIL,
California Univ., Berkeley. Dept. of Soils and Plant Nutrition; Geological Survey, Menlo Park, Calif; and Oregon State Univ., Corvallis.
L. J. Waldron, J. L. McMurdie, and J. A. Vomocil.
Soil Science Society of America Proceeding, Vol 34, No 3, p 393-396, May-June 1970. 4 p, 4 fig, 10 ref.

Descriptors: *Hydraulic conductivity, *Soil compaction, *Stress, *Soil physics, Electrolytes, Soil water movement, Laboratory tests, Porosity.
Identifiers: Confining pressure (Soils).

Hydraulic conductivities (K) of disturbed samples of Yolo loam were measured under isotropic confining pressures of from 0.1 to 3.2 kgm/sq cm in a triaxial test cell. Solutions of 1,10, and 100 meq/liter of NaCl or calcium chloride produced marked differences in K, slight effects on compressibility, and no effect on soil dispersibility. The Kozeny-Carman equation showed the same pattern of failure reported for clays and soils compressed anisotropically, in that K declined much more with decreasing porosity than predicted. Hypothetical K versus depth profiles calculated from K versus confining pressure data support a hypothesis that the K decreases with depth reported in texturally homogeneous soils may be attributable to overburden pressure. WATER PERMEABILITY OF FROZEN SOILS IN THE CENTRAL CHERNOZEM PROVINCE,
G. B. Nazarov.
Transl from (Izvestiya VGO), Vol 101, No 3, p 218-224, 1969. Soviet Hydrology: Selected Papers, Issue No 1, p 79-84, 1969. 6 p, 4 fig, 6 tab, 3 ref.

Descriptors: *Permeability, *Chernozems, *Frozen ground, *Cultivation, Frost, Infiltration, Soil water movement, Lysimeters, Cultivated lands, Grasslands, Forests, Land management, Runoff.
Identifiers: USSR.

The water permeability of frozen soils was studied for 3 years on the runoff plots of the Kursk Forest-Steppe Station of the USSR. The regional soils investigated are thick clay loam chernozems. The experiments were made by the method of flooded rings which were driven into the soil to a depth of 10-15 cm. Water absorption is fairly uniform under stubble, under winter crops, and on virgin land in various parts of the same field both in thawed and frozen soils. Under natural vegetation absorption and filtration depend little on the depth of the thawed soil layer because soil under natural vegetation is more porous as a result of the prolonged effect of root systems and burrowing animals. In fields, the soil is loosened annually during fall plowing and harrowing, but it is compacted by agricultural machines during sowing and harvesting. At the depth of the plow sole (20-25 cm) the soil is compacted by plowshares. Furthermore, at the surface of the plow sole, a large amount of silt and clay is washed in from the overlying loosened soil horizons. Rains also have a considerable compacting effect on plowed fields. Under natural vegetation the soil is protected from the impact of rain drops by the plant mat and in the forest by the litter. COMPUTATION OF THE DESALINIZATION OF SALINE SOILS UNDERLAIN BY A WATER-PERMEABLE LAYER,
R. V. Savel'yeva, and V. A. Baron.
Transl from Izvestiya Akad nauk Uzb SSR, ser. tekh nauk No 3, p 39-43, 1969. Soviet Hydrology: Selected Papers, Issue No 1, p 94-98, 1969. 5 p, 1 fig, 7 ref.

Descriptors: *Saline soils, *Leaching, *Land management, Diffusion, Ion transport, Mass transfer, Groundwater movement, Soil water movement, Permeability, Heat transfer, Convection, Salinity, Water quality, Soil chemical properties.
Identifiers: *Soil desalination, USSR.

The salt regime of soil water forms under the effect of molecular diffusion, sorption, filtration, and thermal and pressure diffusion. The gradients of thermal and pressure diffusion are 4-5 orders of magnitude lower than the gradients of the concentration of matter. Knowing the initial salinization

profile, the leaching rate (magnitude of filtration flow), porosity, the coefficient of convective diffusion, the thickness of the fine-earth mantle, and salt concentration of the leaching water, the salt regime of soils may be calculated. (Knapp-USGS)

RELATIONSHIPS BETWEEN CERTAIN INDICES OF SALINE WATER IRRIGATED SOILS OF WESTERN RAJASTHAN,
Central Arid Zone Research Inst., Jodhpur (India); and Indian Grassland and Fodder Research Inst., Jhansi (India). Div. of Soil Science and Agronomy.
I. C. Gupta, R. K. Bohra, and C. T. Abichandani.
Annals of Arid Zone, Vol 8, No 1, p 27-32, March 1969. 5 tab, 7 ref.

Descriptors: *Saline soils, *Conductivity, *Sodium, *Cations, *Anions, Soil properties, Arid lands, Salts, Soil chemical properties, Soil texture, Alkalinity, Irrigation effects, Soil science, Correlation analysis, Regression analysis.
Identifiers: *India, *Rajasthan desert, *Saturation percentage.

In efforts to appraise soil salinity problems for reclamation efforts, it is important to know the values of electrical conductivity of saturation extracts, EC (e), total soluble cations (TCC.) and soluble Na concentration (SSC). Analytical procedures for obtaining these values are time-consuming, and inter-relationships between the various parameters vary considerably with locale. Fifty-six soil samples of varying saline and sodic conditions were collected in plots irrigated with saline water from different areas of western Rajasthan. The conductivities of 1:2 soil-water suspension, EC (2), were measured with and without known saturation percentage (SP). Analytical procedures allowing determination of EC (e), SSC, and TTC were also performed. Simple correlation coefficients were calculated between EC (2) and EC (e), TTC, and SSC, and also multiple correlation coefficients between EC (2) and EC (e) and SP, TTC and SP, and SSC and SP. Corresponding simple linear and multiple regression equations were then determined. It was concluded that EC (2) is a highly accurate predictor of the crucial parameters of EC (e), TTC, and SSC, and inclusion of known SP improves it predictability. (Casey-Arizona)

IMPORTANT PHYSICAL PROPERTIES OF PEAT MATERIALS,
Forest Service (USDA), Grand Rapids, Minn. North Central Forest Experiment Station.
D. H. Boelter.
Proceedings Third International Peat Congress, Quebec, Canada, 1968, p 150-154.

Descriptors: *Peat, *Organic soils, *Water storage, *Soil density, *Soil water, *Hydraulic conductivity, *Soil physical properties, Bogs, Minnesota, Soil mositure, Soil water movement, Hydrologic properties, Retention, Porosity.
Identifiers: *Fiber content, Degree of decomposition, *Histosols, Water yield coefficient, *Bulk density

Peat materials from 12 bogs in northern Minnesota, U.S.A., showed significant differences in physical properties. It is pointed out that (a) these properties can be related to the hydrology of organic soils only if the soils represent undisturbed field conditions, and (b) volumetric expressions of water content are necessary to correctly evaluate the amount of water in a peat profile. The differences in physical properties were related to degree of decomposition as measured by bulk density and fibre content. Undecomposed peats with low bulk density and high fibre content contain many large pores which yield as much as 80 percent of their saturated water content to drainage and permit rapid water movement. With increasing decomposition, fibre content decreases, resulting in increased bulk density and a greater proportion of small pores. The most decomposed peats yield less than 10 percent of their water to drainage and have very slow water movement rates.

THE HYDROLOGY OF SEVERAL PEAT DEPOSITS IN NORTHERN MINNESOTA, U.S.A.,
Forest Service (USDA), Grand Rapids, Minn. North Central Forest Experiment Station.
R. R. Bay.
Proceedings Third International Peat Congress, Quebec, Canada, 1968, p 212-218.

Descriptors: *Peat, *Organic soils, *Bogs, *Runoff, Minnesota, Swamps, Groundwater, Water table, Streamflow, Small watersheds, Forestry.
Identifiers: *Peatlands, *Wetland hydrology, *Experimental watersheds, Bog watersheds.

A comprehensive peatland hydrology study has provided data on the climate, hydrogeology, water table levels, and run-off from forested peat deposits in northern Minnesota. Groundwater studies identified two types of hydrogeologic situations--perched bogs, independent of the underground flow system, and groundwater bogs, which were influenced by storage changes in the surrounding groundwater basin. Bog water table levels indicated storage opportunity in the peat deposit, and their reaction to precipitation was influenced in part by the type of peat material in the zone of active fluctuation. Bog run-off was not evenly distributed. Most of the annual water yield occurred in spring before June 1, while summer and fall water yields were generally low. Run-off was directly related to water table elevation in the peat deposits.

DISTORTION TESTS ON DRAINED NATURAL CLAY SAMPLES,
Technische Hogeschool, Delft (Netherlands). Dept. of Civil Engineering.
J. D. Nieuwenhuis.
LGM Mededelingen, Delft Laboratoriumvoor Grondmechanica) Deel 13, No 4, p 147-184, April 1970. 38 p, 22 fig, 3 ref, 3 append.

Descriptors: *Clays, *Soil physical properties, *Deformation, Soil mechanics, Compressive strength, Consolidation, Soil compaction, Soil strength, Laboratory tests, Hysteresis, Stress analysis, Strength of materials, Shear strength, Tensile strength, Testing.
Identifiers: Clay mechanical properties.

Results obtained from distortion tests on natural clay samples are presented. The traditional cell test is compared with compression-distortion tests. The few modifications of the cell apparatus necessary to allow the execution of compression-distortion tests are described. A program of tests was designed to investigate the properties of the shear modulus G of drained samples. The samples were subjected to variations in isotropic stress, deviator stress and deviator stress rate. G appeared to be variable, but its reproduction is satisfactory. The influence of isotropic stresss is very small. G is largely determined by the deviator stresses. The hysteresis loop changes if larger maximum deviator stresses are applied. Time effects are reflected in the shear modulus, since clay soils creep (continued deformation under constant load). An empirical estimate of time effects is presented. (Knapp-USGS)

Identifiers: *Liverworts, *Extraterrestrial biology, *Harsh environments, *Water retention, Available water, Macrovegetation, Soil air, Extractable ions, Reflectivity ratios.

Surveys of soil microflora are conducted in various harsh environments such as deserts in an effort to gather experience for similar investigations in extraterrestrial environments. The Valley of the 10,000 Smokes in Alaska's Katmai Peninsula is a harsh environment, and a desert in the sense of sparse support for animal and plant life, but water is not a limiting factor. The area is characterized by high annual rainfall, low annual mean temperature, few sunny days, a soil derived from volcanic eruptions in 1912, soil-eroding winds, and a large number of dying fumaroles. Studies were conducted involving physical and physicochemical soil properties and determinations of soil microflora. Algae, mosses, and liverworts present 40 years ago have died out with the dying fumaroles and cannot become established in other areas due to the sandblasting of the high winds. Soil porosity is high causing rapid drainage and runoff. The soil microflora were limited by a number of soil factors: (1) Low available water (2) Sparse macrovegetation (3) Low clay composition (4) High specific gravity and low bulk density resulting in high erodability (5) A pH-Eh millieu maintaining acidic, reduced and anaerobic conditions (6) Low electrical conductivity and related osmotic pressure values (7) Low percentages of extractable ions (8) Possible Al toxicity (9) Low C, H, and N percentages (10) Generally low wet/dry reflectivity ratios. ecent measurements of microstructure in the
ean show a steplike distribution of temperature,
linity and velocity. One school of thought ex-
ains the microstructure in terms of interleaving of
yers originating at different locations, while
other suggests that vertical diffusion of heat, salt
d momentum may inevitably result in the
velopment of layers. Observations in Lake Bala
Merionethshire and of the thermocline of Loch
ess, a Scottish freshwater lake about 30 km long
d 1 km wide and with an average depth of nearly
0 m both showed microstructure. The vertical
ale of the thermocline microstructure found in
ch Ness is indistinguishable from that found in
e Mediterranean thermocline and in weakly
ratified water in the Pacific Ocean. Temperature
icrostructure in a freshwater lake demonstrates
at salinity gradients are not an essential factor in
e generation of ocean microstructure.

he limnological conditions in Volta Lake were
udied for fishery and other applied scientific pur-
oses, and to gather fundamental data on this
ewly formed tropical lake. Results are sum-
marized on the present state of the lake, effect of certain factors affecting its condition, major conditions occurring since formation of the lake, and some indications of further changes in the near future. The oxygen content was very low in the first 3 yr and well-oxygenated zones were restricted to the uppermost 5 to 10 m strata. Dissolved oxygen increased considerably in the next several years and seasonal fluctuations appeared. The increase in dissolved oxygen appears to be caused by wind activity and a decrease in oxygen consumption from the decomposition of organic material. Floating plants are very abundant in certain sections of the lake, sometimes forming dense mats; under the mats, the water is almost devoid of oxygen and is without fish and other higher aquatic life. The plants are also hosts for snails which are vector organisms for human diseases. Manmade lakes in northern countries should reach stabilized limnological conditions in 20 to 25 yr. In the tropics, changes occur more rapidly and stabilized conditions may be achieved in Lake Volta within 5 to 10 yr. (USBR)

NEARSHORE UNDER ICE WATER MOVEMENT AT NANTICOKE, LAKE ERIE - 1970,
Ontario Water Resources Commission, Toronto. Great Lakes Water Quality Surveys Program.
M. D. Palmer, and J. B. Izatt.
Ontario Water Resources Commission Report, Great Lakes Water Quality Surveys Program, May 1970. 22 p, 5 fig, 6 tab, 2 ref, 3 append.

Descriptors: *Currents (Water), *Lake Erie, *Iced lakes, Lake ice, Measurement, Current meters, Dispersion, Path of pollutants, Water quality control.
Identifiers: Nanticoke (Ontario).

Currents were measured at Nanticoke, Lake Erie, with a recording current meter from December 1969 to March 1970, when an ice cover existed in the area. The currents were measured at a fixed point 700 m from the shore at a point 3 m from the bottom in 11 m of water. The water movements were generally in the same direction as those without an ice cover; however, longer periods of little or no water movement existed. Periods of velocity jetting occurred after the ice cover formed. The mean monthly and hourly dispersion characteristics with an ice cover were significantly less than without an ice cover, particularly in February, indicating the need to avoid waste discharges in the adjacent nearshore areas. Available from the Clearinghouse as PB-188 356, $3.00 in paper copy, $0.65 in microfiche. Oregon State University Engineering Experiment Station Bulletin No 44, October 1969. 158 p, 46 fig, 43 ref. FWQA Project 16080 DRX---10/69.

Descriptors: *Stratification, *Reservoirs, *Water quality, *Mathematical models, *Stratified flow, Currents (Water), Density stratification, Density currents, Model studies, Hydraulic models, Mixing, Flow, Open channel flow, Hydrodynamics, Hydraulics, Simulation analysis, Fluid mechanics.
Identifiers: Stratified reservoirs.

This volume contains two papers devoted to stratified currents research at Oregon State University under the sponsorship of the United States Department of the Interior, Federal Water Pollution Control Adminstration. The general purpose of the work was the investigation of the internal currents created by withdrawal from reservoirs stratified by surface heating. Special attention was given to the effects of entering streamflow and withdrawal on currents. Time-lapse photographic techniques for recording flows through a density stratified impoundment model permits viewing a lengthy experiment (1-1/2 hours) in a few minutes in movie form. Specific studies on geometrical effects of boundaries on internal currents have been conducted. Graphic displays of time development of internal stratified flows have been simulated using digital computers. (See also W70-08502 and W70-08503) (Knapp-USGS)

THREE STATISTICAL PROGRAMS TO PROCESS LIMNOLOGICAL DATA,
Department of Energy, Mines and Resources, Ottawa (Ontario). Marine Sciences Branch.
H. E. Sweers.
Canada Department of Energy, Mines and Resources, Marine Sciences Branch Manuscript Report Series, No 13, 1970. 55 p, 3 fig, 7 ref, 5 append.

Descriptors: *Computer programs, *Statistical methods, *Data processing, *Limnology, Hydrologic data, Statistics, Water temperature, Thermocline, Epilimnion, Hypolimnion, Mixing, Data collections.
Identifiers: Limnological data.

Three programs, written in Fortran IV for a CDC 3100 computer, were designed to calculate means, standard deviations, standard errors and other statistics of various limnological parameters. STATISTICS I gives weighted cruise-mean values, cruise-mean epilimnion and hypolimnion values, tabulations of the relation between temperature and other parameters, and near-bottom means. STATISTICS II is especially designed to study regional anomalies in the distribution of any parameter. STATISTICS III is a more specialized program analyzing the variability in a set of data in terms of random and systematic components. (Knapp-USGS)
W70-08508

PRODUCTION RATE OF THE PERIPHYTON IN LAKE TIBERIAS AS MEASURED BY THE GLASS SLIDE METHOD,
Hebrew Univ., Jerusalem. Dept. of Botany.
Inka Dor.
Israel Journal of Botany, Vol 19, No 1, p 1-15, 1970. 3 fig, 6 tab, 21 ref.

Descriptors: *Periphyton, *Algae, *Primary productivity, *Lakes, Biomass.
Identifiers: *Israel, *Lake Tiberias, Photophilic animals, Mediterranean climates.

The periphyton of Lake Tiberias are mainly Diatomeae who cling to the basaltic rocks and stones along the shore. Glass slides arranged vertically in wooden frames were submerged for 26-35 days and analyzed for biomass. Net production rate (NPR) values fluctuated sharply with time, rising steeply in the spring, peaking for a short duration, then dropping to low summer levels followed by a smaller autumn peak. All dominant species were represented in the spring peak. The seasonal fluctuations had a coefficient of variation of 15.5 percent in the spring and 7.5% in the autumn, and were characteristic of biological activity in subtropical Mediterranean climates. NPR values decreased with depth, indicating extremely photophilic populations. A shore strip of 14 square kilometers had an estimated production potential of 1533 tons of organic matter per year. Although the actual productivity of the strip could not be exactly measured, indirect methods indicated it was 42.5 percent of potential productivity, or 650 tons of net organic matter per year. (See also W70-08534) (Casey-Arizona)

EVAPORATION FROM LAKE TIBERIAS: AN ESTIMATE BY THE COMBINED WATER BALANCE-MASS TRANSFER APPROACH,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.

G. Stanhill.
Israel Journal of Earth-Sciences, Vol 18, p 101-108, 1969. 4 fig, 1 tab, 11 ref.

Descriptors: *Lakes, *Evaporation, *Seepage, *Mass transfer, *Water balance, Vapor pressure.
Identifiers: *Israel, *Lake Tiberias, Wind run.

Ten years of hydrological and meterological records from Lake Tiberias, insufficient in themselves, were combined to yield an estimation of evaporative loss. The sum of evaporation (E) and net seepage flow (S) were poltted against the mass transfer coefficient (N). The value of E + S was determined by a water balance equation utilizing values for inflow, outflow, rainfall and monthly charges in water level. S is not constant throughout the year, but linear curves may be obtained only with data from constant periods. In January, February and March, net inflow is greater than evaporative loss. Two separate linear relationships could be fitted to the data if those months were excluded. The slopes of the 2 curves were identical and the estimate of 1844 mm annual evaporation agreed within 10 percent of previous estimates. Deficiencies in the climatic and hydrological data and possible errors due to theoretical oversimplification are discussed. (See also W70-08533) (Casey-Arizona)
W70-08534

THE TEMPERATURE OF LAKE TIBERIAS,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
G. Stanhill.
Israel Journal of Earth-Sciences, Vol 18, p 83-100, 1969. 10 fig, 3 tab, 10 ref.

Descriptors: *Lakes, *Water temperature, *Thermal properties, Isotherms, Diurnal distribution, On-site investigations.
Identifiers: *Israel, *Lake Tiberias, Areal variation, Heat storage, Surface temperature.

Water temperature measurements on the surface and at various depths at 15 stations on Lake Tiberias were replicated over a period of 2 years. Annual temperature ranges were 16.6 and 19.6 degrees centigrade, equivalent to heat storage changes of 40,000 and 47,240 calories per square centimeter per year. These figures were less than those found in previous years, possibly because of recent drainage project in the area. Areal variations are less than 2 degrees at the surface and increase with depth at shallow levels. Diurnal variations were greatest in surface waters decreased with depth, rarely exceeded 2.5 degrees, and were greatest in summer. Although considerable annual differences in the thermal regime of the lake were found, there is as yet insufficient data for conclusions concerning long term trends.

Descriptors: *Gamma grasses, *Plant growth, *Soil temperature, *Soil moisture, *Arid lands, Range grasses, Forage grasses, Desert plants, Southwest U. S., Semiarid climates, Moisture tension, Moisture stress, Field capacity, Limiting factors, Evaporation.
Identifiers: *Boer lovegrass, *Survival, *Seedlings, *Emergence, *Desert grasslands.

Researchers studied the effects of two temperature regimes and five moisture levels on early growth of boer lovegrass (Eragrostis chloromelas Steud.) and black grama (Bouteloua eriopoda (Torr.) Torr.). Depending on the moisture level, daily maximum soil temperatures ranged from 38 to 51 deg C (low temperature regime) and from 53 to 67 deg C (high temperature regime). Of the five soil moisture levels, level A was approximately at field capacity. Levels B and C were watered as level A on the planting day, then reduced to about one-half and one-third, respectively, of level A for the duration of the trial. Levels D and E were watered as level A for the first three days, then reduced in the same manner as levels B and C. In the 21-day experiment it took 231 mm of water for either species to survive in the high temperature regime, but only 70 mm of water to survive in the low one. Soil moisture reduction a day after planting decreased seedling survival more than moisture reduction on the third day after planting. Neither grass emerged at moisture levels B and C in the high temperature regime. Survival of these species in the Southwest would be enhanced by lower soil temperatures and less evaporation from the soil surface. (Carr-Arizona)

REPRODUCTION BIOLOGY OF THE INDIAN DESERT HARE, LEPUS NIGRICOLLIS DAYANUS BLANFORD,
Central Arid Zone Research Inst., Jodhpur (India). Div. of Animal Studies.
I. Prakash, and G. C. Taneja.
Mammalia, Vol 33, No 1, p 102-117, March 1969. 3 fig, 8 tab, 23 ref.

Descriptors: *Xerophilic animals, *Mammals, *Monsoons, *Reproduction, *Impact (Rainfall), Physiological ecology, Arid lands, Animal behavior, Precipitation (Atmospheric), Wet seasons.
Identifiers: *India, *Rajasthan desert, *Desert hare, *Animal-plant relationships, Rabbits, Annual productivity.

Desert hares were shot and collected every month, for a year, in the Jodhpur region of the Rajasthan desert. The testes were weighed and epididymal smears were taken on male specimens. The numbers of pregnant and lactating females were determined and the corpora lutea and embryos were counted. From these figures, blastocyst transfers, embryonic mortality and annual productivity per female could be estimated. The number of pregnant females and the number of embryos per pregnant female were highest during the monsoon season of July-September when daylength and green forage availability were optimal. The testes weights fluctuated in parallel with the pregnancies, the right testes being significantly heavier than the left. Although breeding activity in different areas could be directly correlated with local forage quality, it was felt that the increase in prevalence of pregnancy during the April-June hot, dry months indicated other reproduction limiting factors in addition to green forage. The annual production of young per female was estimated to be 10.66. It was concluded that seasonal breeding of the Indian hare is in general conformity with seasonal breeding in species of this genus from all over the world. (Casey-Arizona)

SEASONAL CHANGES IN BODY FLUIDS IN A FIELD POPULATION OF SPADEFOOT TOADS,
Southwestern Research Station, Portal, Ariz.; and California Univ., Dept. of Life Sciences.
V. H. Shoemaker, L. McClanahan, Jr., and R. Ruibal.
Copeia, No 3, p 585-591, August 1969. 4 fig, 1 tab, 12 ref.

Descriptors: *Toads, *Arizona, *Amphibians, *Animal physiology, *Osmotic pressure, Moisture stress, Electrolytes, Ureas, Urine, Moisture stress, Moisture uptake, Arid lands, On-site investigations, Animal metabolism, Soil moisture.
Identifiers: *Anurans, *Spadefoot toads, Plasma, Bladder water, Total solute concentrations.

Many anuran amphibian species in arid regions burrow during the dry seasons and emerge during the wet seasons. In an effort to determine body fluid balances in these animals, individuals of 2 species of spadefoot toads (Scaphiopus hammondii and Scaphiopus couchii) in southeastern Arizona were unearthed at 3 different times of the year: (1) September - shortly after burrowing (2) March-about the middle of the dry season (3) June - shortly before emerging. Electrolytes, urea, total solute concentrations in urine and plasma, and bladder urine volume were measured. These were correlated with soil moisture tension. In September and March bladder urine volume and solute concentrations in urine and plasma were equivalent to their levels in fully hydrated animals. In June, all plasma solute levels and urinary urea levels were higher and soil moisture content was lower. This was interpreted as resulting from changes in soil moisture tension during the advance of the dry season. In September and March the toads were presumably capable of passive water uptake from the soil, but by June soil water potential had decreased enough to raise total solute concentrations through the effects of net water loss and metabolic urea production. (Casey-Arizona)

THE ROLE OF THE SEXUAL STAGE IN THE OVER-SUMMERING OF ERYSIPHE GRAMINIS DC. F. SP. HORDEI MARCHAL UNDER SEMI-ARID CONDITIONS,
Technion - Israel Inst. of Tech., Haifa; and Hebrew Univ., Jerusalem (Israel).
K. Koltin, and R. Kenneth.
Annals of Applied Biology, No 2, Vol 65, p 263-268, April 1970. 3 tab, 11 ref.

Descriptors: *Plant diseases, *Pathogenic fungi, *Barley, Parasitism, Arid lands, Grasses, Plant pathology, Growth stages, Water balance, Rainfall, Impact (Rainfall), Leaves, Wet seasons.
Identifiers: *Israel, *Cleistothecia, *Ascospores, Mycelia, Fruiting bodies, Powdery mildew disease, Ascospore differentiation.

owdery mildew disease in barley is caused by the ngal parasite Erysiphe graminis f.sp. hordei. Stues were initiated to determine the role of the sexl stage of the fungus in the epidemiology of this sease in the arid areas of Israel, where the barley owing season and the major rainfall occur from id-October to mid-May, followed by 5-6 rainless onths. All 135 sown barley varieties were atcked by the fungus in at least one nursery, with e appearance of cleistothecia. No ascospores ere found during the growing season or summer. leistothecia collected on dry leaves from May ntil first rains, were kept in constant moisture and most always produced ascospores within 72 ours, but those collected during the rainy season ook up to 264 hours for ascospore differentiation nder the same conditions. Ascospore differentiaon cannot be induced during early or late spring ins, but it does occur during the first autumn ins and this can be correlated with seed induction the barley. In Israel, therefore, a sexual stage is roduced in early spring which tides the fungus ver the summer and produces inoculum for newly nerging host in the fall. (Casey-Arizona)

ODY FLUID PARTITIONING IN REPTILIA,
lebraska Univ., Lincoln. Dept. of Zoology.
homas B. Thorson.
opeia, No 3, p 592-601, June 3, 1969.

escriptors: *Reptiles, *Water balance, *Animal etabolism, Physiological ecology, Animal hysiology.
dentifiers: *Body fluids, *Fluid compartments, Body water content, Extracellular water, Intracelular water, Blood volume, Plasma volume.

y injection of sucrose and Evans blue dye into cirulatory systems, the relative amounts of ody fluid n the major fluid compartments of reptiles were etermined. The species studied were about evenly ivided between marine, terrestrial, and freshwater orms. Specific gravities and volumes of whole lood and plasma, hematocrits, and extracellular nd interstitial fluid volumes were all lowest in the reshwater forms. Conversely, the freshwater forms ad the greatest total body water and intracellular luid volumes. The marine and terrestrial habitats ere considered analogous from the standpoint of ater economy since their fluid partitioning difered in a similar fashion from the freshwater orms, although the marine patterns were omewhat more pronounced. Marine and terrestrial forms have lower body water contents because lehydrating stress is not fully compensated for, lthough extracellular fluid volume is kept high at he expense of protoplasmic water. It is unclear whether the fluid partitioning in the various forms s genetically determined or a response to osmotic tress. (Casey-Arizona)

MYCORRHIZA IN DESERT SOILS,
Northeastern Univ., Boston, Mass. Dept. of Biolo-gy.
A. K. Khudairi.
Bioscience, Vol 19, No 7, p 598-599, July 1969. 1 ig, 8 ref.

Descriptors: *Root systems, *Fungi, *Nitrogen fixng bacteria, *Soil-water-plant relationships, Lichens, ARID LANDS, Xerophytes.
dentifiers: *Iraq, *Mesopotamian desert, *Mycorrhizas, Mycelia, Nutrient cycling.

Mycorrhizas are fungal symbionts associated with many species of cultivated plants and small native desert shrubs in the Mesopotamian desert. Another symbiont in the native shrubs in the nitrogen fixing bacteria, Rhizobium, in the root nodules. When leaves fall in the autumn, nitrogen is added to the soil and its absorption is facilitated by the mycorrhizas. Phosphorus and potassium are also rare in desert soils and their uptake is enhanced by the mycorrhizas. Despite the low soil organic matter, many other fungi such as truffles occur in desert soils. They, together with lichens, mycorrhizas, and soil and root bacteria, form a complex and efficient nutrient recycling system in desert soils. (Casey-Arizona)

STUDIES IN WATER RELATIONS OF RICE,
Calcutta Univ. (India).
P. K. Sen, and D. K. Das Gupta.
The Indian Journal of Agricultural Sciences, Vol 39, No 10, October, 1969, p. 1000-1009. 4 tab, 3 fig, 10 ref.

Descriptors: *Water requirements, Water levels, *Irrigation effects, Fertilizers, *Rice, Nitrates, Fertilizers, *Plant growth.
Identifiers: Chinsurah, West Bengal, India, Ammonium sulphate, Rice varieties, (CB1, Dhairal, Bhasamanik, Dular).

This paper measured the effects of season, water quantity and nitrogen levels on yields of rice in India. Based on experimentation with three varieties of rice, the authors concluded that there is a 'mutual interdependence' between water and nitrogen levels. Under high water levels they found a moderate amount of nitrogen (e.g. 45 kilograms per hectare) produced optimum yields; and with moderate water levels a higher amount of nitrogen was necessary. Also reported was preference for the growing season of November to April. (Holmes-Rutgers)

FOOD AND WATER REQUIREMENTS OF DORCAS GAZELLE IN THE SUDAN,
Khartoum Univ. (Sudan). Dept. of Zoology.
D. B. Carlisle, and L. I. Ghorbial.
Mammalia, Vol 32, No 4, p 570-576, December, 1968. 2 fig, 1 tab, 5 ref.

Descriptors: *Xerophilic animals, *Mammals, *Ruminants, *Food habits, *Leaves, Water conservation, Legumes, Arid lands, Deserts, Droughts, Xerophytes, Moisture availability, Animal metabolism, Drought tolerance, Physiological ecology, Nutrient contents, Water balance.
Identifiers: *Sudan, *Gazelles, *Acacias, *Animal-plant relationships, Leaf moisture content, Crepuscular animals.

Dorcas gazelles, Gazella dorcas dorcas (Linne), were observed in a number of localities in northern Sudan during a 6 month dry period when no green grass was evident. They were essentially crepuscular and fed only on Acacia tortilis, never dry grass or any other green shrub. Acacia tortilis is an arid zone bush which retains its leaves for about 18 months after the last rain. Leaves were analyzed for moisture and nutrient contents as a function of time since the last rainfall. Leaves from areas with a span of 10-40 weeks since last rainfall had a mean moisture content of 6 percent which was not correlated with time within that span. A sample from an area of 80 weeks since last rainfall showed a drop in mean moisture content to 48.6 percent with mean protein, carbohydrate, fibre, ash and calorific contents increasing from 20-45 percent over the 10-40 week samples. The calorific and water requirements of captive gazelles feeding on sorghum were measured. This data was then used to estimate weights of Acacia leaves necessary for consumption in satisfying those requirements. It was concluded the Dorcas gazelle, unlike a close relative, Thompson's gazelle, may survive dry periods without drinking by eating only Acacia leaves, and need move out of a drought-stricken region only after the leaves have fallen. AFTER-EFFECT OF WATER STRESS ON STOMATAL OPENING POTENTIAL I. TECHNIQUES AND MAGNITUDES,
California Univ., Davis. Lab. of Plant-Water Relations.
R. A. Fischer, Theodore C. Hsiao, and Robert M. Hagan.
Journal of Experimental Botany, Vol 21, No 67, p 371-385, May 1970. 7 fig, 4 tab, 21 ref. OWRR Project B-029-CAL.

Descriptors: *Stomata, *Moisture deficit, *Leaves, *Turgidity, Tobacco, Beans, Plant physiology, Moisture uptake, Moisture stress, Drought tolerance, Photoactivation, Water balance, Carbon dioxide.
Identifiers: *Leaf turgor, *Stomatal opening potential, *Leaf discs, Resistance porometer, Fick's law, Stomatal resistance.

During periods of drought, plant leaf stomata close up, thereby decreasing carbon dioxide uptake, which contribute to the general decline of the plant. Leaf discs from tobacco (Nicotiana tabaccum) and broad beans (Vicia faba) were floated on distilled water, under conditions of high relative humidity, low air turbulence, and controlled illumination and temperature, until they reached full turgor. Their stomatal aperture sizes were then estimated by use of a resistance porometer and usually also measured directly. Following a period of stress, the effects of a 30-40 percent water deficit in tobacco leaves involved a markedly lowered ability to open in light and lasted approximately 2-5 days after rewatering. Some leaves recovered to levels greater than the controls, probably due to arrested senescence during stress. Leaf production ceased abruptly during stress and recovered with rewatering. Depressions in stomatal opening potential were positively correlated with extent of deficit but recovery time was independent of duration and severity of stress. The effects of stress in beans were similar, but less pronounced than those in tobacco except that dry weight was not affected and stomatal function recoveries never exceeded control levels. The leaf disc assay technique eliminated the possibility that the measured stomatal after-effect was directly caused by persistence of small leaf-water-deficits. In an Appendix section the validity of the leaf disc assay method is examined. (See also W70-08531) (Casey-Arizona)

AFTER-EFFECT OF WATER STRESS ON STOMATAL OPENING II. POSSIBLE CAUSES,
California Univ., Davis. Lab. of Plant-Water Relations.
R. A. Fischer.
Journal of Experimental Botany, Vol 21, No 67, p 386-404, May 1970. 10 fig, 3 tab, 27 ref. OWRR Project B-029-CAL.

Descriptors: *Moisture stress, *Stomata, *Carbon dioxide, *Leaves, *Turgidity, Tobacco, Beans, Photosynthesis, Plant physiology, Moisture uptake, Moisture deficit, Drought tolerance, Photoactivation, Water balance, Metabolism.
Identifiers: *Guard cells, *Leaf discs, *Stomatal opening potential, Stomatal resistance, Metabolic inhibitors, Carbon dioxide compensation point.

Changes in stomatal apertures by transfers of epidermal strips of bean leaf between stressed and control mesophyll and reduction of the after effect on mean aperture in bean and tobacco leaf strips in carbon dioxide - free air indicated that about one-third of the after effect could be attributed to

changes in leaf mesophyll, probably through elevated substomatal cavity carbon dioxide levels. Although this explanation is not supported by carbon dioxide compensation point measurements, increased sensitivity of poststress discs to photosynthetic inhibitors is consistent with it, and on balance it is thought valid. Large after-effects in epidermal strips lacking mesophyll indicated guard cells were primarily responsible for two-thirds of the phenomenon. Neither carbon dioxide- free air nor metabolic inhibitors, in short term application, appreciably reduced the after-effects, and starch levels in the guard cells did not decrease during the water stress. Stomatal recovery in post-stress tobacco leaves indicated recovery required light and time. However, light was ineffective in carbon dioxide-free air and the light requirement was completely replaced by the addition of glucose-l-phosphate. Recovery may involve 2 temporally separate steps only one of which requires light and probably photosynthate. It was concluded that although guard cell activity is the major factor in the post-stress damage, the mechanisms are not understood. (See also W70-08530) (Casey-Arizona)

EFFECT OF MOISTURE TENSION, TEMPERATURE AND LIGHT ON GERMINATION OF FOUR EXOTIC RANGE GRASSES,
Institute for Research on Natural Resources, Abu-Ghraib (Iraq).
Tariq A. Al-Ani, and Nazar A. Ouda.
Annals of Arid Zone, Vol 8, No 1, p 45-51, March 1969. 2 fig, 2 tab, 12 ref.

Descriptors: *Germination, *Xerophytes, *Range grasses, *Temperature, *Moisture stress, Arid lands, Osmotic pressure, Moisture tension, Drought tolerance, Plant growth, Light.
Identifiers: *Iraq, *Germination rate, Mannitol.

Four species of imported palatable pasture grasses, Cenchrus ciliaris, Cenchrus setigerus, Eragrostis superba and Panicum antidotale, were tested for germination capabilities in varying temperatures in dark and light, and under varying moisture stresses. In temperature studies ranging from 20-30 degrees centigrade, it was found that germination rates increased with temperature. Only E. superba showed a preference for light in final germination at higher temperatures. D-mannitol, at osmotic concentrations ranging from 1/3-15 atmopheres simulated drought conditions. In all cases, as moisture tensions increased, germination rate decreased and time to final germination increased. However, the 4 species responded differentially, and the descending order in ability to germinate under drought conditions was: C. setigerus, C. ciliaris, E. superba and P. antidotale. Seeding growth under differing moisture tensions, as measured by plumule and radicle growth, also showed differential responses. The descending order of growth ability under drought conditions was E superba, C setigerus, C. ciliaris and P antidotale (Casey-Arizona)

A BURET CYLINDER FOR GRAIN-SIZE ANALYSIS OF SILT AND CLAY (WITH ALGOL-PROGRAM),
Technische Hochschule, Munich (West Germany). Sedimentology and Marine Geology Div.; and Bayerische Landesstelle fur Gewasserkunde, Munich (West Germany).
F. Fabricius, and St. Muller.
Sedimentology, Vol 14, No 1-2, p 39-50, April 1970. 12 p, 6 fig, 1 tab, 13 ref.

Descriptors: *Computer programs, *Analytical techniques, *Particle size, *Silts, *Clays, Sediments, Suspended load, Turbidity, Settling velocity, Sieve analysis.
Identifiers: *Particle size analysis.

A new apparatus, using a buret cylinder was constructed in order to increase the efficiency of the size analysis of fine-grained sediments. Its uncomplicated operation and automatic leveling enable working series of 10 samples or more at a time. This method, an improvement of the pipet method, works with an accuracy comparable to that of the Atterberg method. An ALGOL-program was compiled to compute all data obtained from the granulometric analysis of sediments. In the output, the numerical parameters are printed out and a simple frequency and a cumulative diagram is plotted. The computer program works for grain sizes from -6 phi to +9 phi. Two procedures can be applied alternatively: (a) sieving--buret analysis; and (b) sieving--visual accumulation tube--buret analysis. (Knapp-USGS)

TREATMENT OF SPHERICITY AND ROUNDNESS DATA OF QUARTZ GRAINS OF CLASTIC SEDIMENTS,
Regional Engineering Coll., Rourkela (India). Dept. of Geology.
Basanta K. Sahu, and B. C. Patro.
Sedimentology, Vol 14, No 1-2, p 51-66, April 1970. 16 p, 13 tab, 21 ref.

Descriptors: *Particle shape, *Sands, *Analytical techniques, *Sediments, Sieve analysis, Statistical methods, Quartz, Measurement.
Identifiers: Sphericity, Roundness, Sorting.

Sphericity and roundness data of quartz grains (of varying size) of sieve fractions are empirically shown to be non-normally distributed. It is also demonstrated that log transformations normalize the sphericity and roundness data. Laboratory experiments on sampling quartz grains from a sieve fraction show that the cone-and-quartering method is preferable as it yields similar results to those of the more time-consuming random sampling procedure. Results of laboratory measurement errors on two-dimensional sphericity and roundness data are also presented. The frequency of sphericity and roundness data are noted. For all parametric statistical studies of sphericity and roundness the sample statistics should be calculated according to normalizing log functions. Suitable grade scales of sphericity and roundness data are proposed based on log functions, the total range, and the minimum range of the variates (sphericity and roundness). (Knapp-USGS)

THE IDENTIFICATION OF ANCIENT BEACH SANDS BY THE COMBINATION OF SIZE ANALYSIS AND ELECTRON MICROSCOPY,
A. V. Hodgson, and W. B. Scott.
Sedimentology, Vol 14, No 1-2, p 67-75, April 1970. 9 p, 7 fig, 1 tab, 11 ref.

Descriptors: *Particle size, *Sieve analysis, *Electron microscopy, *Beaches, *Stratigraphy, Sedimentology, Sands, Petrography, Petrology, Sedimentary rocks
Identifiers: Particle surface texture.

The combined use of size analysis and electro microscopy indicates the presence of beach sand within the Lower Carboniferous Fell Sandstone o southeast Scotland and northern England. Environmental interpretations are based on a compariso of the statistical parameters summarizing the siz distributions of the Fell Sandstone specimens wit similar data from modern sediments. The spread o standard-deviation values (sorting coefficients) in dicates the presence of littoral, alluvial, an possibly offshore marine environments within th Fell Sandstone. These environments are furthe defined by plotting standard deviation again skewness on a scatter diagram. Electron micro graphs of the quartz grain surface textures o selected Fell Sandstone specimens corroborate th interpretations based on the size analysis and sho all the diagnostic surface features developed o modern quartz beach sand grains. PHYSIOGRAPHIC FEATURES AND STRATIFICATION TYPES OF COARSE-GRAINED POINT BARS: MODERN AND ANCIENT EXAMPLES,
Texas Univ., Austin. Bureau of Economic Geology
J. H. McGowen, and L. E. Garner.
Sedimentology, Vol 14, No 1-2, p 77-111, Apr 1970. 35 p, 25 fig, 1 tab, 25 ref.

Descriptors: *Sedimentary structures, *Alluvi channels, *Flood plains, *Bed load, *Suspende load, Sediment transport, Deposition (Sediments Alluvium, Ripple marks, Dunes, Scour, Erosion Meanders.
Identifiers: Colorado River (Tex), Amite Riv (La), Point bar deposits.

Primary sedimentary structures in modern point bar deposits of the Amite River in Louisiana an the Colorado River in Texas are analogous to fea tures observed in Eocene Simsboro and Pleistocen Colorado River deposits of the Texas Gulf Coast Plain. Stratification consists of large-scale trough fill cross-stratification in the scour pool; trough-fi cross-stratification and foreset cross-stratificatio in the lower point bar; parallel laminae, larg foreset cross-stratification,and trough-fill cross stratification in the chute bar; parallel incline laminae, climbing ripple laminae, and mud drape in the chute fill; and parallel inclined laminae, mu drape, and foreset cross-stratification in overban flood-plain deposits. Fundamental difference between point bars of bed-load streams and mixed load streams are that upper point bar sediment with small trough sets and parallel inclined lamina occur only in fine-grained (mixed load) fluvi deposits, and large scale foresets of chute bars ar common to coarse-grained (bed load) fluvi deposits but are not found in fine-grained fluvia deposits. Upward fining sequences, characteristi of fine-grained fluvial deposits, are uncommon i sediments deposited by bed-load streams such a the Amite and Colorado rivers. (Knapp-USGS)

VERCONSOLIDATION BY DESICCATION OF OASTAL LATE-QUATERNARY CLAYS IN RAEL,
echnion - Israel Inst. of Tech., Haifa. Dept. of vil Engineering.
mos Komornik, Vera Rohrlich, and Gdalyah iseman.
dimentology, Vol 14, No 1-2, p 125-140, April 70. 16 p, 13 fig, 1 tab, 13 ref, append.

escriptors: *Clays, *Porosity, *Consolidation, Compaction, *Moisture content, Bottom sedients, Pressure, Drying, Laboratory tests.
entifiers: *Israel, Desiccation (Clays).

te Quaternary clays in Haifa Bay and Ashdod arbor, Israel, are overconsolidated by desicca-n. This conclusion was reached through analysis the preconsolidation pressure as function of the tual overburden pressure, and by analogy with ays undergoing desiccation, and confirmed in boratory experiments. It is in agreement with the own geology of the area. For pressures above 2.0 /sq cm, a definite statistical relationship was tablished between the preconsolidation pressure d the in situ void ratio. For lower pressures, the situ void ratio is mainly governed by environ-ental conditions during deposition and thought so to be governed by the clay mineralogy. (K-pp-USGS)

Identifiers: Climbing ripples, Cross-bedding.

The angle of climb of ripples in cross-laminated deposits is governed by a simple relation in which the angle of climb is a function of the rate of sediment deposition normal to the rippled bed, the ripple height, and the bedload sediment transport rate. This relation is developed using sediment transport functions and the assumptions of gradually varied flow to predict the spatial patterns of cross-lamination types in deposits due to pure nonuniform flow, pure unsteady flow, and simulataneous nonuniform and unsteady flow. Most of the predicted patterns can be matched from the geological record, and the analysis affords insight into the environmental significance of climbing-ripple cross-lamination. The analysis also results in a rigorous definition of the kinds of environmental interpretation that may legitimately be made from examples of this structure. (Knapp-USGS)

Descriptors: *Particle size, *Particle shape, *Measurement, *Hydrometers, Settling velocity, Instrumentation, Analytical techniques.
Identifiers: Equivalent particle diameter.

It is shown that in calculating the viscous force on a nonspherical particle suspended in a fluid, it is necessary to use the largest dimension of the particle. This may be calculated from the diameter of the equivalent sphere obtained from a hydrometer analysis provided the shape of the particle is known. (Knapp-USGS)

A METHOD TO STUDY THE DISTRIBUTION OF HEAVY-MINERAL GRAIN ABUNDANCE IN A TURBIDITE,
Mineral Research and Exploration Inst., Ankara (Turkey).
Teoman N. Norman.
Sedimentology, Vol 13, No 3/4, p 263-280, December 1969. 18 p, 8 fig, 4 tab, 18 ref.

Descriptors: *Sedimentary petroiogy, *Statistical methods, *Distribution patterns, *Frequency analysis, Sedimentation, Particle size, Particle shape, Turbidity currents, Density currents, Bottom sediments, Mineralogy.
Identifiers: *Turbidites.

Variations in the absolute frequencies of individual heavy-mineral species in a turbidite may best be studied by selecting a particular grain size as the 'nominal grain,' and numbers of grains of a particular mineral in all size classes can be converted to nominal grains. The total number of nominal grains per gram of sediment sample is defined as the 'nominal grain abundance,' which is a function of the volume (or weight) of the total mineral in the sample. Study of a simple, graded, Tertiary turbidite indicates that the least vertical change in heavy-mineral content occurs at, or slightly above, the middle part of the bed. Heavy minerals in the distal part of the turbidite have more uniform vertical distribution than in the proximal part. (Knapp-USGS)
W70-08202

GRAIN SIZE OF TURBIDITE RIPPLES,
Groningen Rijksuniversiteit (Netherlands). Geological Inst.
Ph. H. Kuenen, and F. L. Humbert.
Sedimentology, Vol 13, No 3/4, p 253-261, December 1969. 9 p, 2 fig, 8 ref.

Descriptors: *Sedimentary structures, *Ripple marks, *Particle size, *Turbidity currents, Density currents, Silts, Currents (Water), Velocity, Bed load, Suspended load.
Identifiers: Turbidites, Current ripples.

Many current ripples show log-normal grain-size distribution and good sorting. A range in medians was measured from fifty to several hundred microns. Turbidite ripples are log-normal, very well sorted and are restricted to medians of very fine sand to silt (less than 130 microns) because the particles are supplied in suspension at rippling velocity. Experimental suspension current ripples formed at about 50-60 cm/sec are similar in composition and structure to turbidite ripples. The continuous supply results in climbing ripples. The restricted grain size and the internal structure of turbidite ripples both form strong evidence against the action of normal currents. (Knapp-USGS)
W70-08203

GRAIN-SIZE IMAGE OF CLASTIC DEPOSITS,
R. Passega, and R. Byramjee.
Sedimentology, Vol 13, No 3/4, p 233-252, December 1969. 20 p, 5 fig, 9 ref.

Descriptors: *Particle size, *Correlation analysis, Statistics, Statistical methods, Analytical techniques, Mapping, Grading, Sands, Sediments, Sediment transport, Silts.
Identifiers: Grain-size image.

A clastic deposit may be represented by several diagrams. C-M diagrams in which C is the one-percentile, M the median of the grain-size distribution, characterize the coarsest fractions of the samples. F-M, L-M and A-M diagrams in which F, L and A, respectively, are the percentages by weight in the samples of grains finer than 125, 31 and 4 microns characterize the finest fractions. As a group, these diagrams form the 'grain-size image' of a deposit. These parameters were selected because they are closely related to transport and deposition mechanisms. As a consequence, the grain-size image gives fairly precise information on hydraulic conditions under which a deposit is formed. Relationships which exist between certain sizes of clastic grains and the most probable deposition mechanism are used to classify clastic sediments by subdividing them into types indicative of their genesis. Integrated with ecological determinations and sedimentary structure descriptions, grain-size facies maps are a means of environment analysis. (Knapp-USGS)
W70-08204

MEASUREMENT OF PARTICLE SHAPE BY FOURIER ANALYSIS,
McMaster Univ., Hamilton (Ontario). Dept. of Geology.
H. P. Schwarcz, and K. C. Shane.
Sedimentology, Vol 13, No 3/4, p 213-231, December 1969. 19 p, 11 fig, 1 tab, 16 ref.

Descriptors: *Measurement, *Particle shape, *Fourier analysis, Statistical methods, Sediments, Sands, Analytical techniques.
Identifiers: Particle shape analysis.

An objective procedure is described for quantifying the shape of two-dimensional closed curves from projections or sections of particles, for example, sand grains. The curves are plotted in polar coordinates, and a harmonic analysis is made by numerical analysis of measurements at equally spaced sample points along the curves. Quantities corresponding to the conventional properties of sphericity and roundness are derived from the Fourier coefficients. Three different measures of roundness are proposed and shown to correlate with visually estimated roundness classes, though also depending to some extent on sphericity. An attempt is described to study the interaction between these two properties by analysis of synthetically rounded plastic particles. (Knapp-USGS)
W70-08205

FLUORESCENT SAND AS A TRACER OF FLUVIAL SEDIMENT,
Geological Survey, Washington, D.C.
Vance C. Kennedy, and Dorothy L. Kouba.
For sale by Superintendent of Documents, U S Government Printing Office, Wash, D C 20402 - Price $0.30. U S Geological Survey Professional Paper 562-E, pp E1-E13, 1970. 13 p, 14 fig, 4 tab, 21 ref.

Descriptors: *Tracers, *Tracking techniques, *Sediment transport, *Dye releases, Radioactivity techniques, Sands, Tagging, Particle size, Bed load, Suspended load, Sampling, Fluorescence.
Identifiers: Dyed sand particles.

Stream sand coated with fluorescent paint was added at a constant known rate to Clear Creek at Golden, Colo., during a 28-hour period, and the concentration of fluorescent grains was monitored at a point 810 meters downstream from the point of introduction. Stream width in the study reach averaged about 21 m, mean velocity about 1.4 m/sec, and mean discharge 8.2 cu m/sec. Flow was very turbulent over a gravel bed. First-arrival time of fluorescent sand correlated with the square of grain diameter in the range 0.15-0.86 millimeters. Steady-state conditions apparently were achieved for the finer particles, with highest concentrations on the north side and lowest concentrations on the south side of the stream. Lateral mixing of coarser grains was much better than for finer grains. The sediment discharge computed from the tracer-dilution method was about 30% greater than the suspended-sediment discharge computed from suspended samples for the 0.15-0.18mm range and about 200% greater for the 0.38-0.52 mm range. MOBILE BED HYDRAULICS,
Alberta Univ., Edmonton. Dept. of Civil Engineering
T. Blench
Text also in French. Journal of Hydraulic Research, Vol 8, No 2, p 159-187, 1970. 19 p, 8 fig, 1 tab, 17 ref.

Descriptors: *Sediment transport, *Alluvial channels, Hydraulics, Bed load, Suspended load, Sediment load, Turbulent flow, Regime, Streamflow, Open channel flow, Open channels, Channel morphology.
Identifiers: Mobile bed hydraulics.

A definite inductive science of mobile bed hydraulics has been forming during the last decade from a combination of facts and ideas about the self-formation of sediment-bearing canals and rivers, the visibly different phases of bed waves in flumes. Formalization is outlined along essentially the lines which initiated the friction-factor diagram of rigid boundary hydraulics for circular pipes. Recommendations are listed for use in formalizing mobile bed hydraulics and for orienting future research. (Knapp-USGS)

JUMPLIKE MOVEMENT OF A SOLID PARTICLE AT THE BOTTOM OF A TURBULENT STREAM,
K. I. Rossinskiy, and K. S. Lyubomirova.
Transl from Trudy Gos. Gidrologicheskogo Instituta, No 162, p 221-235, 1969. Soviet Hydrology: Selected Papers, Issue No 1, p 38-49, 1969. 12 p, 8 fig, 1 tab, 3 ref.

Descriptors: *Sediment transport, *Saltation, *Model studies, Hydraulic models, Flumes, Tractive forces, Suspended load, Bed load, Particle size, Velocity.
Identifiers: *USSR.

To study the movement of sediments in the transitional stage between rolling and suspension, the Moscow Laboratory of the State Hydrologic Institute and the Department of Physics of Moscow State University have taken moving films of rolling and jumping gravel particles in a uniform turbulent stream. The moving films were taken in two series with different bottom roughnesses and flow regimes. The movement of individual gravel particles in the second series of experiments was accompanied by the movement of a suspended load made of suspended polystyrene balls 1-1.15 mm in diameter and of a density of 0.98-1.04. The experiments were made in a glass flume of variable slope, 8 m long and 0.5 m kigh and wide. The optical axis of the camera was directed across the stream and was located 123 cm from the floor. W70-08265

RELATIONSHIPS BETWEEN LANDSCAPE-GEOMORPHOLOGICAL FACTORS AND SEDIMENT DISCHARGE IN RIVERS OF WESTERN TRANSCAUCASIA,
L. F. Litvin.
Transl from (Vestnik MGU, geogr. ser.), No 4, p 60-64, 1969. Soviet Hydrology: Selected Papers, Issue No 1, p 85-88, 1969. 4 p, 4 fig.

Descriptors: *Sediment yield, *Geomorphology, Provenance, Suspended load, Bed load, Regime, Sediment discharge, Discharge (Water).
Identifiers: *USSR, Transcaucasia.

The Moscow State University Black Sea Expedition determined the sediment discharge at the mouth stations on rivers in western Georgia. All river basins were classified by factors determining sediment discharge, and the sediment discharge was measured in rivers typical of different groups. The basins of some of these rivers (Kodori Bzyb', Inguri) include areas falling in all elevation zones; the headwater of the others in general do not extend beyond the zone of mountains of intermediate elevation. All these rivers pass through the foothills zone and coastal lowland. A definite correlation between the mean elevation of a basin and the runoff of Caucasian rivers has been established. The elevation of the area, the landscape-geomorphological factors governing the existence of an elevational zonality of landscapes, and lithology exert the greatest effect on the modulus of suspended sediment discharge. The steep slopes in the longitudinal profiles of rivers and abundant precipitation in the mountainous country virtually ensure the transport of all suspended sediments beyond its limits. The runoff modulus of bed-load discharge depends primarily on the change in the competence of a stream along its length and the closeness of the sources of coarse material. (Knapp-USGS)

MUD VOLCANO CLAY, TRINIDAD, W. I.,
Columbia Univ., New York. Dept. of Geology.
Paul F. Kerr, and Darlene S. Richardson.
Available from Clearinghouse as AD-691 265 $3.00 in paper copy, $0.65 in microfiche. US Air Force Cambridge Research Laboratories, Bedford, Mass, Scientific Report No 3, April 16, 1969. 22 p, 8 fig, 4 tab, 19 ref. USAF Project No 8623-02-01.

Descriptors: *Volcanoes, *Mud, *Movement, Geology, Gases, Geologic control, Sediments, Clays, Structural geology, Mineralogy.
Identifiers: Mud volcanoes, Trinidad (W. I.), Thixotropic mud.

Laboratory studies of clay mineral samples were made from two mud volcanoes in the island of Trinidad. The mineral content and physical properties were compared with clay samples from the Lower Cruse and Nariva Formations through which the throats of the mud volcanoes are believed to have penetrated. Earlier studies suggested that the mud volcanoes formed either as a result of tectonic movement, accumulated gas pressure, or a combination of the two mechanisms. The thixotropic character of the clay may have greatly accelerated wither mechanism. Thixotropic clay saturated with water becomes a highly mobile fluid with great transporting power. Where such a mobile mass accumulates along a partly broken anticlinal structure, any release of pressure will occur upward. A gas pocket, tectonic squeeze, or both will provide pressure to maintain upward motion. In this way, the clay would be extruded to form a mud volcano. Although moving vertically and supported by gas and tectonic pressure, the clay flowage has characteristics comparable to horizontal clay movement in landslides where gas is not involved and motion is maintained by gravity. SETTLING VELOCITY OF GRAINS OF QUARTZ AND OTHER MINERALS IN SEA WATER VERSUS PURE WATER,
Geological Survey, Menlo Park, Calif.
Charles I. Winegard.
For sale by the Superintendent of Documents U.S. Government Printing Office, Washington, D.C. 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter B, US Geological Survey Professional Paper 700-B, p B161-B166, 1970. 6 p, 2 fig, 3 tab, 7 ref.

Descriptors: *Settling velocity, *Salinity, *Fresh water, *Sea water, *Particle size, Viscosity, Density, Mineralogy, Sedimentation, Deposition (Sediments), Quartz, Clay minerals.
Identifiers: US Geological Survey.

The settling velocities of particles in sea water differ significantly from those in fresh water. For example, a 10-micron-diameter quartz sphere in sea water will settle 4,000 meters in 882 days. The same particle in fresh water will settle to that depth in 824 days, 6.58 percent less time. Velocities in sea water can be calculated for a spherical particle of given size and composition if the viscosity and specific gravity of the water are known. (Knapp-USGS)

. Culbertson, and C. H. Scott.
sale by the Superintendent of Documents, US vernment Printing Office, Washington, DC, 02 - Price $3.25. In: Geological Survey earch 1970, Chapter B, US Geological Survey fessional Paper 700-B, p B237-B241, 1970. 5 p, g, 5 ref.

scriptors: *Alluvial channels, *Rio Grand, *New xico, *Sedimentary structures, *Sediment trans- t, Channel morphology, Dunes, Ripple marks, d waves, Sand bars, Regime, Scour, Deposition diments), Particle size, Sands.
ntifiers: Sorting (Sediments).

ic sounder records were used to document the elopment and movement of transverse bars in Rio Grande conveyance channel near Bernar- N. Mex. Rate of movement was about 350 and feet per day for two transverse bars observed. oth of flow was less and velocity of flow was ater over the bars than in the dune reaches, but water-surface slopes were equal. Median size of l-surface material on the backs of bars was finer n the bed-surface material in the dune reaches. e mechanics of formation and movement of nsverse bars is obscure; however, the bars may formed by the coalescence of large dunes, and vement is caused by scour of the bar at the up- eam end and deposition at the downstream end. natural sorting of bed material at the upstream l of the bar is also indicated. Journal of Hydrology, Vol 10, No 2, p 141-150, February 1970. 10 p, 1 fig, 14 ref.

Descriptors: *Hydrogeology, *Groundwater, *Surface-groundwater relationships, *Radioactivity techniques, *Radioactive dating, Groundwater movement, Deuterium, Tritium, Stable isotopes, Oxygen, Model studies.
Identifiers: Oxygen isotopes, Lake Chad Basin.

Study of water resources in the Lake Chad Basin, undertaken by UNESCO since 1966, consists of the preparation of a map of the entire basin, an analog model, and an examination of all previous studies. To verify and control existing data, a complementary isotopes study was made, including determinations of H-2, O-18, C-14, C-13 and tritium. The average rainfall at present feeding the aquifers in the Chad Basin has an O-18 content of -6 ppt relative to the SMOW standard. Because of evaporation the water of the Chari River, representing about 90% of the total input in the Lake Chad, becomes enriched in O-18 from about -4 ppt to +17 ppt at the northeast border areas of the lake. The groundwaters near Lake Chad generally have -4 to -7 ppt O-18. In the aquifers ages of over 40,000 years are found by C-14 analyses. Some groundwaters in the North of the Chad Basin with O-18 contents of -8 to -11 ppt suggest climatic conditions perceptibly different from the present climate, with lower temperatures and a higher relative humidity. (Knapp-USGS)

HYDROGEN ISOTOPIC FRACTIONATION OF WATER PASSING THROUGH TREES,
Geological Survey, Denver, Colo.; and Agricultural Research Service, Fort Collins, Colo.
R. L. Wershaw, Irving Friedman, S. J. Heller, and P. A. Frank.
In: Advances in Organic Geochemistry-1966, International Series of Monographs in Earth Sciences, Vol 32, Proceedings of 3rd International Conference on Organic Geochemistry, London, England, September, 1966, p 55-67, 1970. 13 p, 6 fig, 6 tab, 6 ref.

Descriptors: *Evapotranspiration, *Stable isotopes, *Deuterium, Transpiration, Evaporation, Circulation (Plants), Consumptive use, Spectrometers.
Identifiers: Mass spectrometry

Mass spectrometry was used to compare deuterium content in trees with that of the water sources used by the trees. The water in the leaves of a tree is enriched in deuterium with respect to the water in the phloem and the xylem of the tree which, in turn, are enriched in deuterium with respect to the groundwater beneath the tree. The enrichment in the leaves is apparently due to isotopic fractionation that takes place during transpiration, and the amount of fractionation is a function of the rate of transpiration from the tree; the transpiration rate is dependent upon temperature, relative humidity and solar radiation level. Two different processes have probably contributed to the enrichment of deuterium in the water in the phloem and xylem tissue: (1) movement of water from the leaves down into the trunk of the tree, and (2) enrichment of deuterium in the soil water surrounding the tree roots by evaporation. The isotopic composition of the water vapor coming from the soil should therefore be different from that of the water vapor from tree leaves, and it should, consequently be possible to calculate, by making a materials balance, the ratio of the amount of water evaporating from soil to the amount of water transpiring from leaves in a given area. STRUCTURES OF ALUMINUM HYDROXIDE AND GEOCHEMICAL IMPLICATIONS,
Geological Survey, Menlo Park, Calif
Robert Schoen, and Charles E. Roberson.
American Mineralogist, Vol 55, p 43-77, January-February 1970. 35 p, 11 fig, 2 tab, 54 ref.

Descriptors: *Geochemistry, *Mineralogy, *Clay minerals, *Crystal growth, *X-ray diffraction, Laterites, Soil formation, Bonding, Catalysts, Silicates, Weathering, Aluminum
Identifiers: *Gibbsite, *Bayerite, *Nordstrandite, *Aluminum hydroxide, Crystal chemistry, Bauxites.

Synthesis experiments in the alumina-water system at room temperature indicate that the gibbsite polymorph precipitates slowly from solutions whose pH is below the point of minimum solubility (pH 5.8), and the bayerite polymorph precipitates rapidly from solutions whose pH is above 5.8. Nordstrandite, the third polymorph of aluminum hydroxide, forms from bayerite during aging at intermediate to high pH values. In solutions of intermediate pH, both gibbiste and bayerite form, but with aging, early-formed gibbsite disappears as more bayerite forms. The extent of polarization by the aluminum cations determines whether the hydroxyl ions will possess cylindrical symmetry as in bayerite or tetrahedral symmetry as in gibbsite. It is suggested that the extent of polarization is inherited from the polarization in aqueous aluminum complexes. The usual abundance of the silicate ion in natural alkaline environments may explain the scarcity of nordstrandite, for the silicate ion may favor the precipitation of aluminosilicate minerals. Near absence of bayerite in nature may indicate that it is metastable and inverts to nordstrandite. (Knapp-USGS)

BARIUM IN SEA WATER,
Lamont-Doherty Geological Observatory, Palisades, N Y.
K. Wolgemuth, and W. S. Broecker.
Earth and Planetary Science Letters, Vol 8, No 5, p 372-378, June 1970. 7 p, 6 fig, 3 tab, 14 ref. NSF Grant GA 1188.

Descriptors: *Water chemistry, *Sea water, *Trace elements, Sampling, Tracers, Radioisotopes, Stable isotopes, Analytical techniques, Radiochemical analysis.
Identifiers: Barium, Barium compounds, Isotope dilution analysis.

Vertical profiles of barium content were determined in the Atlantic and Pacific Oceans by the isotope dilution method. The Atlantic shows a range from 8 to 14 and the Pacific from 8 to 31 micrograms/liter (surface to deep water, respectively). Barium is incorporated into the remains of organisms in the surface ocean and released to the deep sea as the organic debris sinks toward the bottom. The greater surface to deep concentration increase observed in the Pacific is consistent with that found for other biologically active elements (Si, C, N, P, and others). The similarity of Ba and Ra profiles supports the expected chemical coherence between these elements. (Knapp-USGS)

GOLD IN THE MODERN SEDIMENTS OF THE NORTHERN PART OF THE ATLANTIC OCEAN BASIN,
G. N. Anoshin, E. M. Yemel'yanov, and G. A. Perezhogin.
Translated from Geokhimiya, No 9, p 1120-1129, 1969. Geochemistry International, Vol 6, No 5, p 897-905, 1969. 9 p, 6 fig, 4 tab, 16 ref.

Descriptors: *Gold, *Trace elements, *Bottom sediments, *Atlantic Ocean, Particle size, Sedimentation, Sedimentary rocks, Water chemistry, Sampling, Neutron activation analysis.
Identifiers: USSR.

Average gold contents in modern marine clastic sediments (1.3 ppb in the Atlantic Ocean, up to 6.0 ppb in the Black Sea) are close to the published averages for sedimentary rocks. The coquinoid limestones of the Black Sea are enriched in gold (up to 150 ppb), and elsewhere in the Atlantic basin biogenic limestones contain from 0.7 to 9.0 ppb of gold. There is a well defined positive correlation between the contents of gold and organic matter in the sediments. In clastic sediments, gold content increases with decrease in grain size, but this correlation is not observed in the biogenic sediments. (Knapp-USGS)

REMOBILIZATION OF PHOSPHATES AND MICRO-NUTRIENTS AND THEIR EFFECT ON THE PRODUCTION OF PLANKTON IN WATER CULTURES (IN GERMAN),
J. Clasen, and H. Bernhardt.
English summary. Archiv fur Hydrobiologie, Vol 65, No 4, p 528-538, 1969. 4 fig, 6 tab, 20 ref.

Descriptors: *Silts, *Phosphates, Sediments, Reservoirs, Rivers, Testing, Algae, Phytoplankton.
Identifiers: Soluble phosphate, Suspended particulates, Wahnbach River (Germany), Wahnbach Reservoir (Germany), Germany, Chlorella, Cryptomonas, Oscillatoria rubescens.

The suspended particulates of the River Wahnbach (Germany), largely silt, were separated by filtration and added in various amounts to flasks filled with river water or water from its terminal reservoir. The flasks were incubated in the dark, at rest, and under aerobic conditions for a fortnight. Subsequent analyses of water above the sediment revealed no change in phosphate concentration in flasks with river water, but a liberation of about 15% of phosphate from the silt in flasks with water of the reservoir. The difference is explained by a presumable state of equilibrium existing in phosphorus-rich river water and a deficiency of the element in water of the basin. Tank trials with water enriched in either silt or soluble phosphates and several species of algae failed to yield conclusive results. Some test organisms, particularly Chlorella spp, attained maximum density in cultures with soluble phosphates. Other algae (Cryptomonas spp) grew better in silt containing cultures. This effect is attributed to the presence of some unidentified growth-promoting ingredients in the silt, aside from the liberated phosphates. (Wilde-Wisconsin)

HE FLOOR OF CENTRAL SAN FRANCISCO AY,
eological Survey, Washington, D.C.
aul R. Carlson, Tau R. Alpha, and David S. cCulloch.
ineral Information Service, Vol 23, No 5, p 97-07, May 1970. 11 p, 7 fig, 2 map, 1 tab, 12 ref.

escriptors: *Bathymetry, *Topography, *Bottom diments, *Bays, Profiles, Mapping, Surveys, ides, Tidal effects, Scour, Erosion, Geomorpholo-, Sounding, Depth, Hydrography, Sand waves, ediment transport.
entifiers: *San Francisco Bay.

entral San Francisco Bay has a complex orphology that has resulted largely from stream rosion, which produced a highly irregular floor on e tectonically deformed bedrock, and from com-ex tidal circulation, which has generated currents at have simultaneously scoured deep modern annels and deposited sediment to produce exten-ve shoals. The wide range of energy environments at exists in the central bay is reflected in the grain ze and thickness of the unconsolidated sediment nd the morphology of the modern bay floor. Where current and wave-energy levels are low, ch as in Richardson Bay and the Berkeley mud ats, the resulting thick sequence of uncon-olidated sediment is predominantly silt and clay. s the amount of energy increases, the grain size ecomes larger and sand predominates, as it does ver most of the central bay. With increasing ener-, large sand waves are formed on the bottom, and the highest energy environments, such as eneath the Golden Gate Bridge, the bedrock ap-ears to be swept clean of sediment. The thickness f sediments as shown on acoustic subbottom rofiles varies from none over bedrock knobs and he flanks of the islands to more than 250 feet in arts of the central bay. (Knapp-USGS)

he determination of the natural radioelements in uspended matter in rivers and estuaries lead to a imple exponential relation between gamma activi-y and turbidity. A new turbidimetry method is ased on this relation. In situ measurements have een conducted with field gamma scintillometers nd compared with different turbidimetry methods, uch as nephelometry, gravimetry and gamma ray bsorptiometry. This method has been particularly onvenient to continuous in situ measurements of urbidity from 0.5 to several hundreds of g/liter. his broad range is very well adapted to turbidity tudies in estuaries. The new method was applied to tudy suspended matter dynamics in the Gironde stuary (France) during November 1968, as a part f a more general study of natural radioactivity in errigenous sediments brought into the ocean. THE SEDIMENTS AND SEDIMENTARY PROCESSES OF THE EASTERN MISSISSIPPI CONE, GULF OF MEXICO,
Florida State Univ., Tallahassee. Dept. of Geology.
Ter-Chien Huang.
Florida State University Sedimentology Research Laboratory Contribution No 31, December 1969. 124 p, 11 fig, 6 tab, 114 ref, append.

Descriptors: *Bottom sediments, *Deltas, *Mississippi River, *Sedimentary structures, *Sedimentary rates, Turbidity currents, Silts, Clays, Deposition (Sediments), Sediment distribution, Sediment transport, Gulf of Mexico.
Identifiers: Mississippi Cone.

Sedimentary processes on the eastern Mississippi Cone were interpreted from sedimentary structures, textures, and compositions as well as from bathymetry, bottom photographs and continuous seismic profiles of the deep-sea fan. Twenty-nine piston cores and 25 gravity cores show that the sediments consist of a repetitious vertical succession of gray silts and silty clays intercalated with occasional layers of fine sand. Each core is topped by a 20 to 50 cm layer of yellowish brown foraminiferal clay. Disequilibrium age determinations indicate that the lower silty layers, representing the deposits of latest low sea level stands, were deposited more rapidly than the upper foraminiferal clays. These sedimentation rates depend primarily on the rate of the detrital influx and sea level change and average about 30 cm/1000 years. The primary mechanisms of sediment transport are differential pelagic settling and low-flow regime bottom currents, with mass movements by sliding or slumping common in channel and slope areas. A MARYLAND COASTAL AQUIFER,
Maryland State Geological Survey, Baltimore.
Harry J. Hansen.
Journal American Water Works Association, Vol 62, No 5, p 286-292, May 1970. 7 p, 8 fig, 2 tab, 10 ref.

Descriptors: *Water management (Applied), *Model studies, *Decision making, *Atlantic Coastal Plain, *Aquifers, Groundwater, Groundwater movement, Planning.
Identifiers: Groundwater zoning models.

A managerial model based on the zoning concept is outlined for use with areally extensive artesian aquifers occurring in several layers; artesian aquifers of this description characterize the Coastal Plain states from New Jersey to Texas. The model is inapplicable to water-table situations. It assumes humid-area conditions in which precipitation is not so important a limiting factor as the permeability and thickness of the aquifer, the hydraulic gradient between the artesian aquifer and its outcropping recharge belt, and the amount of leakage occurring through confining beds. Applying field data, each of the major artesian aquifers occurring beneath Southern Maryland and the Eastern Shore are subdivided into several user categories. To illustrate this procedure, discussion is focused initially on a specific formation---the Aquia Aquifer. (Knapp-USGS)

LITHIFICATION OF DEEP SEA SEDIMENTS BY PYRITE,
Duke Univ., Durham, N. C. Dept. of Geology; and Duke Univ., Beaufort, N. C. Marine Lab.
Michael E. Field, and Orrin H. Pilkey.
Nature, Vol 226, p 836-837, May 30, 1970. 2 p, 3 fig, 7 ref.

Descriptors: *Lithification, *Sediments, *Pyrite, *Continental shelf, Atlantic Ocean, North Carolina, Core drilling, Diagenesis.
Identifiers: *Hatteras Outer Ridge, *Hatteras Canyon System.

Unique pyrite-cemented silty sand layers have been found in three out of 35 piston cores taken from the North Carolina lower continental rise at depths from 4,770 to 4,950 m. The layers are approximately 0.5 cm thick and consist mainly of terrigenous grains in a cement identified as pyrite by X-ray diffraction analysis. None of the precursor iron sulfides commonly associated with sedimentary pyrite were found. The pyritized layers are geologically significant because they must play a part in restricting and channeling vertical exchange between seawater and sediment as well as in interstitial water reactions and migrations. Although the layers are thin and volumetrically unimportant in the local sediment column, the occurrence is of great interest because such cementation by pyritization is one of only two known mechanisms of lithification in the uppermost portions of deep sea sediments. (Woodard-USGS)

VARIABLE BOUNDARY, TWO DIMENSIONAL TIDAL MODEL,
Alaska Univ., College. Inst. of Marine Science.
J. B. Matthews, and J. C. H. Mungall.
Nature, Vol 226, p 835-836, May 30, 1970. 2 p, 2 fig, 4 ref.

Descriptors: *Estuaries, *Mathematical models, *Currents (Water), *Tides, *Computer programs, Digital computers, Profiles, Model studies, Tidal waters.
Identifiers: *Variable boundary tidal model.

A two dimensional program which can be used to solve semidiurnal tidal problems in estuaries is described. The mathematical basis for the analysis is derived from a two-dimensional explicit model originally developed for the North Sea, using the North Sea model's basic differential equations, equations of motion in two horizontal dimensions, and the equation of continuity. Solution of the equations, by finite difference methods, is facilitated by a grid layout and is staggered in time and space. The grid can be terminated at alternate lines in both directions to represent either open or closed boundaries. An integer control matrix is built in the computer from separate linear integer matrices for each row and column of the grid. The input is by punched card. The model has been applied to several examples, both theoretical and practical, with excellent results. (Woodard-USGS)

Text also in French. Journal of Hydraulic Research, Vol 8, No 2, p 229-259, 1970. 31 p, 9 fig, 38 ref.

Descriptors: *Hydraulic models, *Sediment transport, *Waves (Water), *Bed load, Unsteady flow, Continental shelf, Beaches, dunes, Ripple marks, Mass transfer, Suspended load, Flumes, Currents (Water), Littoral drift, Erosion.
Identifiers: Wave modeling.

Water particle motion at the sea bed beyond the breaker line is essentially a linear oscillation along the line of wave advance for a single wave train. When two wave trains are angled to each other, the resultant motion varies from linear in two directions to elliptical and circular in a horizontal plane. The techniques used to study sediment transport in the offshore zone are discussed and a new modeling concept is introduced. A block or mass of water is oscillated in a flume, superimposing oscillatory motion on steady flow. The most realistic replication of wave motion in the deeper zones of the Continental Shelf should include angled wave trains. The principle of the 'water block' could be extended for this purpose. A cylindrical box with vertical axis and open bottom could be oscillated in two mutually perpendicular directions. (Knapp-USGS)

DISTRIBUTION OF DOLOMITE IN A TIDAL FLAT ENVIRONMENT, SUGARLOAF KEY, FLORIDA,
Esso Production Research Co., Houston, Tex.
D. K. Atwood, and J. N. Bubb.
Journal of Geology, Vol 78, No 4, p 499-505, July 1970. 7 p, 2 fig, 1 tab, 7 ref.

Descriptors: *Dolomite, *Carbonate rocks, *Diagenesis, *Water chemistry, *Tidal marshes, Shallow water, Florida, Sampling, Salinity, Calcium, Magnesium, Sea water, Tides.
Identifiers: Tidal flats, Sugarloaf Key (Fla).

A study of modern tidal flats on Sugarloaf Key, Florida, has been made to determine distribution of penecontemporaneous dolomite, the presence of which was previously reported by Shinn. Dolomite occurs in a crust at or near the surface of Recent tidal flat sediments and in lesser amounts in unconsolidated sediments. The greatest concentration of dolomite is near the shoreline and within topographic lows on the flats, that is, areas where sediments are most frequently wet by tides. The dolomite concentration decreases toward interior and higher portions of the flats, and essentially no dolomite was found in adjacent bays. Interstitial waters expressed from Recent sediments on the flats were analyzed at different times in the year and found to be near sea water in salinity and chemistry. This combination of dolomite distribution and interstitial water data suggests that dolomitization is occurring with waters near sea water in composition. (Knapp-USGS)

National Nuclear Corporation, Palo Alto, Calif.
Frederick E. Crever.
For sale by Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $1.50. Office of Saline Water Research and Development Progress Report No 526, October 1969. 147 p, 16 fig, 37 tab, 15 ref, 3 append. OSW Contract No 14-01-0001-2192.

Descriptors: *Desalination processes, *Water pollution control, *Design, *Nuclear engineering, Nuclear reactors, Nuclear wastes, Radioactive wastes, Costs, Cost analysis, Systems analysis.
Identifiers: Contamination control.

Potential concentration of radioactive nuclides in the water plant brine, effluent, and product water were determined for dual purpose power generation and desalting plants using nuclear steam supply systems. The nuclear steam supply systems considered were those using the light water-cooled and moderated reactors. The direct cycle system using the boiling water reactor, and the pressurized water reactor using the indirect cycle were both considered. A design basis was studied for a pressurized, demineralized water loop to be inserted between the heating steam from a nuclear steam supply and the brine in a multistage flash sea water desalting plant to allow extended operation at full capacity with brine heater leakage. The loop is to be pressurized to about 10 psi above both the heating steam and the brine so that any leakage that occurs in the heat exchangers would be either into the nuclear steam supply system or into the water plant brine. The leakage would be pure water, which would not be harmful to either the steam supply system or the water plant. A design basis was also studied for an isolating loop using steam as the working fluid between a nuclear steam supply and a multistage flash sea water distillation plant. With horizontal brine heaters, the steam temperature would have to be raised to 273 deg F which would give a steam pressure of 43.8 psia in order to insure steam pressure above brine pressure at all points of potential leakage. (Knapp-USGS)

REPORT ON DIFFERENTIAL THERMAL AND THERMOGRAVIMETRIC ANALYSIS,
Wrightsville Beach Test Facility, N.C.
John R. Newton, and M. E. Atkins.
For sale by the Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $1.00. Office of Saline Water Research and Development Progress Report No 514, December 1969. 99 p, 75 fig, 20 ref.

Descriptors: *Scaling, *Chemical analysis, *Differential thermal analysis, *Gravimetric analysis, *Distillation, Desalination processes, X-ray analysis.
Identifiers: Thermogravimetric analysis.

The need for analytical data pertaining to the composition of scales from distillation plants resulted in an evaluation of differential thermal analysis (DTA) and thermogravimetric analysis (TGA). The data obtained by DTA-TGA can be easily interpreted. X-ray methods will qualitatively identify trace compounds which may not be detected by DTA-TGA. X-ray and TGA methods provide quantitative results; however, TGA provides a more accurate quantitation of major constituents with less time spent in interpretation and little, if any, standard analyses required. DEVELOPMENT OF MODIFIED POLYOLEFIN MEMBRANES FOR REVERSE OSMOSIS,
Southwest Research Inst., San Antonio, Tex.
H. F. Hamil, and W. W. Harlowe, Jr.
For sale by Superintendent of Documents, US Government Printing Office, Wash, DC 20402 - Price $0.65. US Office of Saline Water Research and Development Progress Report No 530, June 1970. 58 p, 9 fig, 22 tab, 2 ref. OSW Contract No 14-01-0001-2129.

Descriptors: *Desalination processes, *Reverse osmosis, *Permselective membranes, *Plastics, *Laboratory tests, Permeability, Ion transport, Semipermeable membranes.
Identifiers: Grafted polyethylene membranes.

Procedures were studied for the radiation-induced grafting of polyethylene film to yield a variety of modified polyethylene membranes. Modification of the polyethylene was accomplished by grafting with acidic monomers such as aminoalkyl methacrylates and vinylpyridines, and neutral monomers such as hydroxyalkyl methacrylates. Some graft ter polymers were prepared by incorporating relatively hydrophobic monomers such as acrylonitrile

rylamide, or vinyl acetate into the grafting solu-
n along with acrylic acid. Crosslinking during
fting was accomplished by use of difunctional
onomers in the grafting solution. The membranes
produced maintained much of the tensile
ength and elongation of the original
lyethylene. The acid- and base-grafted films
re hydrophilic, particularly as the potassium and
drochloride salts. The hydrophilicity of such
embranes was reduced by crosslinking or by
grafting with a hydrophobic monomer. The
utral membranes appeared to be relatively im-
rmeable to water. (Knapp-USGS)

large number of monomers were grafted and
emically attached to the cellulose acetate
olecules of Loeb membranes for reverse osmosis,
th subsequent growth of polymeric side chains of
e monomer. The grafting of nonpolar monomers
ve no improvement in either water flux or salt re-
tion efficiency. Strongly polar monomers, espe-
lly positively charged quaternaries, substantially
creased the water flux without loss in salt rejec-
n efficiency. The polar charge of the grafted
ains may orient the dipole molecule of water and
crease its transport rate. Grafting on completely
epared membranes gave results that were
oducible and uniform, and permitted meaning-
comparison with reference membranes. (K-

lls, Injection wells.

ater harvesting systems were developed and eval-
ted. These systems consisted of gravel covered
astic and sodium-treated catchments with plastic-
ed, butyl-covered storage tanks and un-
rground storage into unused aquifers through ar-
icial recharge. A plastic-laying gravel spreader
at attaches to a dump truck was developed and
ed to install a one-half acre gravel covered plastic
tchment. The catchment supplies water to a
0,000-gallon capacity storage tank which is lined
th 6-mil polyethylene plastic and covered with a
tyl rubber cover. Field tests using sodium
loride were conducted on 8 X 16 and one acre
ts. These tests indicate that the sodium chloride
atment does reduce the infiltration rate on sandy
m soils. The overall increase for the year follow-
ing treatment was approximately 35 per cent. Field tests made using a recharge pit and a recharge well indicated that for small quantities of harvested, sediment free water, the recharge well would be recommended for injection into underground storage, substantial water quality changes could occur in percolating water when using the recharge pit. The same injection well could be used to recover the recharged waste. (Cluff-University of Arizona)

CONDENSATION AS A MECHANISM FOR WATER GAIN IN NOCTURNAL DESERT POIKILOTHERMS,
California Univ., Los Angeles Dept. of Zoology.
Robert C. Lasiewski, and George A. Bartholomew.
National Science Foundation research grants GB-5347 and 6B-5139. Copeia, No 2, p 405-407, August 31, 1968. 1 fig, 1 tab, 8 ref.

Descriptors: *Xerophilic animals, *Condensation, *Microenvironment, *Moisture availability, Relative humidity, Dew point, Animal physiology, Toads, Reptiles, Physiological ecology, Water balance, Arid lands.
Identifiers: *Poikilotherms, *Fossorial animals, Spiders.

Four nocturnal, fossorial, and poikilothermic desert-dwelling animals - a banded gecko, trantula, and two species of spadefoot toads - were cooled for 30 minutes at 15 deg centigrade and 90-100 percent relative humidity. Each was subsequently transferred to a weighing chamber at 30-32 deg centigrade and 85-92 percent relative humidity. Each animal gained weight as a result of water condensation on its body surfaces. The amount condensing varied directly with body size but bore no relation to body weight. Desert subsoil temperatures in the summer are fairly uniform and often greater than 30 deg centigrade. Humidity in the burrows may be quite high in contrast to the outside. The body temperature of a nocturnal poikilotherm moving about on the ground surface may drop 10-15 deg, creating the necessary conditions for condensation upon reentry into the warm, humid burrow. Whether such condensation could yield physiologically useful water cannot be answered in the absence of data on water turnover rates in desert poikilotherms. It is stressed that these experiments indicate that such condensation could occur in nature, but it is not implied that it actually does. (Casey-Arizona)

Descriptors: *Hydrologic budget, *Evapotranspiration, *Phreatophytes, *Arizona, Energy budget, Water balance, Streamflow, Groundwater, Evaporation, Transpiration, Alluvial channels, Water supply, Water resources development, Water conservation.
Identifiers: Gila River Phreatophyte Project.

The most obvious need in phreatophyte-control research is evaluation of water conservation on a flood plain typical of many areas of existing and proposed application. Hydrologic and ecologic variables must be defined by the evaluation so that the data may be applied to other sites. A 24-kilometer (15-mile) reach of the Gila River flood plain in the San Carlos Indian Reservation was divided into three subreaches. About 2,400 hectares are covered by phreatophytes, principally saltcedar and mesquite. Phreatophyte removal was started in 1966. Postclearing measurement will extend to July 1972. A water budget includes surface and subsurface inflow and outflow in the Gila River and its tributary inflow to the reach, precipitation on the flood plain, and changes in groundwater storage in the saturated and unsaturated zones of the study reach. The vegetation, chemical quality of water, sedimentation, and climate also are being studied. The water budget is the basic method of evaluation. All data are being collected for analysis by digital computer. (Knapp-USGS)

MAJOR UNITED STATES WATER PROBLEMS ALONG THE INTERNATIONAL BOUNDARY REACH OF THE RIO GRANDE (BRAVO),
International Boundary and Water Commission, El Paso, Tex. Office of Water Control.
Ted E. Henderson.
In: International Water Law Along the Mexican-American Border, Committee on Desert and Arid Zone Research, Southwestern and Rocky Mountain Division, A.A.A.S., No 11, p 26-36, 1968. 2 fig, 5 ref.

Descriptors: *Texas, *Rio Grande, *International Boundary and water commission, Water supply, Water control, Water quality, Dams, Flood control, Reservoirs.
Identifiers: *Mexico.

Since the water treaty of 1944 between the U.S. and Mexico, the major Rio Grande water problems in the U.S. have been: (1) Regulation and usage (2) Water quality (3) Water supply (4) Flood damage. The river flow is now largely regulated by dams and the remaining problems are only those of adjudicating Texas water rights and improving irrigation practices. In the areas of major usage, supply problems exist or are anticipated in the El Paso, Maverick and Lower Rio Grande areas where demands are rapidly increasing. The principle quality problem is salt accumulaton on both the American and Mexican sides, resulting from shortage of water for leaching salts. Although efforts are being made, a final solution will be achieved only by additional water from the outside. Water from desalinization will probably be a major factor sometime in the future. Current construction plans, when realized, will probably eliminate flood damage. (Casey-Arizona)

PEANUT RESPONSE TO UNIFORM AND NON-UNIFORM SOIL SALINITY,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
J. Shalhevet, P. Reiniger, and D. Shimshi.
Agronomy Journal, Vol 61, No 3, p 384-387, May-June 1969. 3 fig, 3 tab, 5 ref.

Descriptors: *Peanuts, *Saline soils, *Plant growth, *Crop response, *Crop production, Arid lands, Irrigation, Evapotranspiration, Adsorption, Germination, Growth stages, Seeds, Plant physiology, Salinity, Salt tolerance, Soil profiles.
Identifiers: *Soil salinity, *Water uptake, Israel.

Peanuts grown in artificially salinized plots showed a 50 percent yield reduction at an EC sub e of 4.7 mmhos/cm and a 20 percent reduction at an EC sub e of 3.8 mmhos/cm. As long as there was equal mean soil salinity, the shape of the soil salinity profile did not affect yield reduction. As salinity increased, total ET decreased, but it would appear that the reduction in water uptake resulting from increased soil salinity was the consequence of reduced growth rather than the cause of it. The decrease in ET efficiency at high salinity levels was due not to transpiration, but to evaporation from plots having an incomplete plant cover. Salt tolerance was higher during germination than during any subsequent growth stage. At an EC sub e of 13 mmhos/cm a 50 percent reduction in germination was obtained. There was a similar 50 percent reduction in seedling development at an EC sub e of 7.2 mmhos/cm. (Carr-Arizona)

3D. Conservation in Domestic and Municipal Use

MCFEETERS V PARKER (ADMINISTRATIVE AGENCY'S CONTROL OVER PUBLIC UTILITIES).

30 A2d 300-305 (Vt 1943).

Descriptors: *Vermont, *Water supply, *Pipes, *Administrative agencies, Eminent domain, Judicial decisions, Legal aspects, Water demand, Conduits, Legislation, Public utilities, Public health, Water distribution (Applied), Consumptive use, Water conveyance, Distribution systems, Pumping plants, Public benefits.

Defendant operated a water system pursuant to plaintiff Public Service Commission sactions, serving the general area as a public utility. After supplying water for a number of years to plaintiff's property, defendant's supply to that property was terminated without the prior permission of the Commission. The Commission had later ordered defendant to furnish the property with a supply of water after finding that the continuance of the service was necessary for the safety, convenience and accomodation of the public. Defendant was also ordered to repair all pipelines and appliances necessary to bring a water supply to the property. Plaintiffs petitioned for a writ of mandamus to enforce these orders. Defendant answered by challenging the constitutional authority of the Commission. The court held that defendant's system had an adequate supply of water and that there would be no financial difficulty in restoring service to plaintiff's property. The court held further that the Commission's order was within its statutory and constitutional powers of general supervision over companies engaged in the sale and distribution of water for domestic purposes. (Barnett-Florida)

PETITION OF NEW YORK WATER SERVICE CORP (REVIEW OF ADMINISTRATIVE ORDER DENYING APPROVAL OF SHALLOW WELL CONSTRUCTION).
283 NY 23, 27 NE2d 221-225 (1940).

Descriptors: *New York, *Saline water intrusion, *Administrative decisions, *Shallow wells, Cities, Municipal water, Wells, Groundwater, Water consumption, Water supply, Water quality, Water pollution sources, Well regulations, Administrative agencies, Adjudication procedure, Judicial decisions, Legal aspects, Civil engineering, Water works, Urbanization, Water policy, Population, Chlorine, Well permits, Drawdown.

Petitioner was a private water company which was the sole supplier of water to a large part of Brooklyn. Due to the intrusion of chlorine, sand and salt into various underground sources, petitioner's daily yield from these sources had decreased over a period of years. In the same period population had gradually increased in the area petitioner served. Petitioner applied to defendent Water Power and Control Commission for approval of a plan to construct and temporarily operate four wells of shallow depth until a new source could be obtained from another water development project. The Commission denied the application on the grounds that public necessity did not justify use of new wells and that their construction could increase salt-water intrusion into the area. Petitioner appealed to the court for review. The court found that defendant's contentions did not rest on such adequate findings of fact as would enable parties or a court to determine whether the decision followed as a matter of law. Further, petitioner had not been allowed to cross-examine defendant's investigating engineer concerning his conclusions. The court remanded the proceedings to the Commission with instructions to make findings of fact. (Hubener-Florida)

CITY OF SPRINGDALE V FLEMING (ENFORCEMENT OF CONTRACT TO SUPPLY WATER).
89 SW2d 602-603 (Ark 1936).

Descriptors: *Arkansas, *Easements, *Usufructuary right, *Contracts, Cities, Pipes, Water conveyance, Water conservation, Water costs, Water delivery, Water distribution (Applied), Water supply, Drains, Reasonable use, Irrigation, Cavitation, Consumptive use, Irrigation water, Domestic water, Conduits, Judicial decisions, Legal aspects, Springs.

Plaintiff contracted with and coveyed to defendant city a tract of land upon which was located a spring. Plaintiff also gave an easement over an additional tract he owned to allow defendant to lay water mains. As consideration for these transfers, defendant agreed to furnish plaintiff with free water for domestic, yard and stock watering purposes. Plaintiff received free water until defendant disconnected the water supply, alleging plaintiff's abuse of the privilege by using water for commercial, irrigation, and purposes other than as comtemplated in the contract. Plaintiff brought action for a mandatory injunction to enforce the contract. Defendant appealed from a lower court holding for plaintiff. On appeal, defendant alleged: (1) that the contract was void since it failed to comply with an applicable statute; and (2) that the right of the city to acquire a water source and an easement to lay its water mains was ultra vires. The court held that it was immaterial whether the water supply was acquired in conformity with the statute. Defendant could not retain the spring and easement without continuing to pay the agreed upon consideration, which was the free use of water by plaintiff. (Barnett-Florida)

NEW YORK WATER SERV CORP V WATER POWER AND CONTROL COMM'N OF DEP'T OF CONSERVATION OF NEW YORK (EXCESSIVE DELEGATION OF POWER TO DETERMINE NECESSITY FOR WELLS AS NOT CREATING PROPERTY RIGHT).
256 App Div 80,9 NYS2d 299-301 (1939).

Descriptors: *New York, *Supervisory control (Power), *Administrative dicisions, *Well permits, Wells, Water supply, Potable water, Administrative agencies, Administration, Legal aspects, Judicial decisions, Legislation, Water demand, Subsurface waters, Well regulation, Water permits, Regulation, Decision making, Institutional constraints, Well spacing.
Identifiers: *Constitutional law.

Petitioner public water company was authorized by defendant Water Power and Control Commission 'to sink as many wells as it may find to be necessary in order to obtain sufficient water to meet the needs of its customers.' Subsequently, without notice, defendant rescinded the authorization. Petitioner sought annulment of the recission order, contending that such order destroyed property rights created by the authorization. The appellate court held that, in allowing petitioner to determine the future necessity for additional wells, the Commission had exceeded its statutory power. This was so even though the authorization had been coupled with the limitation that the Commission must approve all well locations. The authorization, therefore, being in excess of the Commission's power to grant, gave petitioner no right which partook of the aspect of property. Accordingly, when the

uthorization was rescinded, there was no property ght to take away. The recission, not being viola- ve of the due process clause of the Federal Con- itution, was affirmed. (Marsee-Florida)

INFLUENCE OF IRRIGATION INTERVAL AND PLANT DENSITY OF ALFALFA SEED PRODUCTION,
American Univ., Beirut (Lebanon). Faculty of Agricultural Sciences.
S. Abu-Shakra, M. Akhtar, and D. W. Bray.
Agronomy Journal, Vol 61, No 4, p 569-571, July-August 1969. 1 tab, 6 ref.

Descriptors: *Irrigation effects, *Alfalfa, *Seeds, *Crop production, *Crop response, Irrigation, Irrigation practices, Environmental effects, Density, Spatial distribution, Semiarid climates.
Identifiers: *Irrigation interval, *Plant density, *Hard seeds, *Lebanon, Pods, Yield components.

Alfalfa was grown in 1966 and 1967 on the Beqa'a Plain of Lebanon in order to study the influence of certain variables on seed production. Plants were irrigated in intervals varying from 1 to 4 weeks and within-row spacings were 25, 50, or 75 cm. The optimum irrigation interval appeared to be once every two weeks for a seasonal water total of 25.7 cm. Such an irrigation frequency produced the highest seed yield and generally increased 1,000-seed weight, number of seeds per pod, and number of pods per raceme. The greatest number of hard seeds came from plants irrigated at 3 or 4-week intervals. The 50-cm plant spacing produced alfalfa with the highest yield per plot. 'African,' 'Chilean,' and 'Hairy Peruvian' varieties of alfalfa were used in the experiment. 'Hairy Peruvian' was the shortest of the three varieties, but produced more seeds per pod and more pods per raceme. (Carr-Arizona)

IRRIGATED WHEAT ON A CALCAREOUS SOIL AS AFFECTED BY APPLICATION OF NITROGEN, PHOSPHORUS, POTASSIUM, AND ZINC: I. YIELD, COMPOSITION, AND NUMBER OF HEADS,
American Univ., Beirut (Lebanon). Faculty of Agricultural Sciences.
H. D. Fuehring.
Agronomy Journal, Vol 61, No 4, p 591-594, July-August 1969. 4 tab, 8 ref.

Descriptors: *Wheat, *Irrigated land, *Calcareous soils, *Fertilizers, *Crop response, Nutrients, Nutrient requirements, Essential nutrients, Deficient elements, Arid lands, Semiarid climates, Irrigation, Supplemental irrigation, Crop production, Cereal crops, Grains (Crops), Nitrogen, Phosphorus, Potassium, Calcium carbonate, Rates of application.
Identifiers: *Lebanon, *Zinc, First order effects, Heads.

A Mexican semi-dwarf wheat, 'Pitic 62,' was grown under irrigation on the calcareous soil of the Beqa'a Plain in Lebanon. Since the soils of this arid and semiarid region lacked sufficient N and P for irrigated crops, experiments were conducted with applications of N, P, K, and Zn. N applications increased grain yield up to 9 metric tons/ha, but at current prices the most economic application rate was 300 kg/ha for a yield of 6 to 8 metric tons/ha. P and Zn tended to reduce grain yield when they were applied. This was apparently due to overstimulation of tillering, which at the normal seeding rate resulted in an excessive number of heads per unit area. Such an increase in tillering may be important if expensive hybrid wheat seeds make it desirable to use low seeding rates. Fertilization with each variable increased its own concentration in the grain. While significant negative first order effects were shown by N on P concentration and by K on Cu concentration, significant positive first order effects were shown by N on Ca concentration and by P on K concentration. Two- and three-way interactions considerably modified some of these first order effects. (Carr-Arizona)

SUMMER FALLOW FOR DRYLAND WINTER WHEAT IN THE SEMIARID GREAT PLAINS,
Agricultural Research Service. Northern Plains Branch; and Nebraska Univ., North Platte. Agricultural Experiment Station.
D. E. Smika.
Agronomy Journal, Vol 62, No 1, p 15-17, January-February 1970. 3 tab, 8 ref.

Descriptors: *Wheat, *Dry farming, *Fallowing, *Crop response, *Great Plains, Semiarid climates, Nebraska, Grains (Crops), Cereal crops, Rotation, Precipitation (Atmospheric), Rainfall, Soil moisture, Soil water, Water management (Applied), Water utilization, Stubble mulching, Crop production, Limiting factors, Fertilizers, Nitrogen.
Identifiers: *Winter wheat, *Water-use efficiency, Crop failure, Nitrogen content.

Continuously cropped wheat was compared with summer-fallowed wheat under semiarid conditions and the fallowed wheat was found to have three times the average yield of the continuous wheat. Not only were there no crop failures recorded for the fallow-wheat during the 27-year study, but fallow-wheat also demonstrated up to 80% greater water-use efficiency than continuous wheat at 43 cm annual precipitation or below. In comparison, continuous wheat failed more than 30% of the time and attained equal water-use efficiency at 58 cm or above only with application of N fertilizer. Continuous wheat required N fertilizer in order to obtain maximum yield, water-use efficiency, and N content. Fallow-wheat, however, contained as much N without fertilization as continuous wheat with fertilization and fertilized continuous wheat used water only 71% as efficiently as unfertilized fallow-wheat. It appears that the summer fallow system is superior to continuous wheat production under semiarid conditions. (Carr - Arizona)

DRAINAGE AND SALINITY,
Department of Agriculture, Lethbridge (Alberta). Research Station.
J. C. Van Schaik, T. G. Sommerfeldt, and E. Rapp.
Canada Agriculture, Vol 15, No 2, Spring 1970, p. 9-11. 6 fig.

Descriptors: *Irrigation effects, Water tables, Saturated soils, *Salinity, *Tile drains, Canal linings, *Drainage, Irrigation canals, Drainage systems.
Identifiers: Alberta.

Although irrigation projects in the semiarid regions of Western Canada have been beneficial to land reclamation and increased crop production, improper drainage and high soil salt contents have led to waterlogging and salt accumulation. In order to combat these problems the Canadian Department of Agriculture has been experimenting with closely spaced tile drains for subsurface salt drainage and the emplacement of plastic or concrete liners on the bottoms of irrigation canals to water seepage into areas adjacent to the canals. SOIL WATER USE FROM AN APPLE ORCHARD UNDER VARIOUS SOIL MANAGEMENT SYSTEMS,
Department of Agriculture, Ferntree Gully, (Victoria). Scores by Horticultural Research Station.
J. D. F. Black, and P. D. Mitchell.
Australian Journal of Experimental Agriculture and Animal Husbandry, April 1970, Volume 10, number 43, p. 209-213, 16 references, 2 fig, 4 tables.

Descriptors: *Water loss, Soil moisture, Wilting point, Nuclear meters, Microclimatology, Crop responses, Soil-water-plant relationships.
Identifiers: *Southern Victoria, Paraffin-cadmium technique.

Four soil management systems for growing mature apple trees were tested to determine the comparative amount of water lost during spring and summer. There were no appreciable differences found for total water losses between the four management practices: pasture, pasture with herbicide treatment, trashy cultivation (i.e. spring cultivation followed by summer and autumn weed growth), and clean cultivation (i.e. weeded). However, the apple trees under trashy cultivation lost slightly more water than the others during summer, while the trees grown on pasture lands without herbicide treatment lost more water during spring. SALVI V JOHN A MANNING PAPER CO (NEGLIGENT MAINTENANCE OF A DIKE).

168 Misc 661, 7 NYS2d 36-42 (Sup Ct 1938)

Descriptors: *New York, *Dikes, *Riparian rights, Adjudication procedure, Boundaries (Property), Contracts, Judicial decisions, Legal aspects, Natural flow doctrine, Relative rights, Riparian land, Riparian waters, Remedies, Damages, Dam failure, Floods, Maintenance, Usufructuary right, Flooding, Flood damage.
Identifiers: *Negligence, *Affirmative covenants, *Dam maintenance.

Defendants owned a dike which had fallen into disrepair through neglect. Consequently the creek which the dike had impounded flooded plaintiff's land. Plaintiff contended that defendants were bound by an affirmative covenant in a deed which their predecessor in title had negotiated to keep the dike in repair. Plaintiff sought the enforcement of this covenant and damages for defendants' negligent maintenance of the dike. The court held that an affirmative covenant is personal, not real, and as such it will not run with the land. Consequently, plaintiff could not seek enforcement of such covenant. The court held further, however, that notwithstanding the existence of an affirmative covenant to repair, responsibility for damages caused by negligent maintenance of a dam is generally imposed on the owner of the structure. Plaintiff's complaint sufficiently alleged such negligence on the part of defendants. Defendants' motion to dismiss the complaint as a whole was denied. (Clarke-Florida)

THIRD BUCKINGHAM COMMUNITY, INC V ANDERSON (COLLECTION AND DISCHARGE OF SURFACE WATER ONTO ADJOINING LAND).

178 Va 478, 17 SE2d 433-437 (1941).

Descriptors: *Virginia, *Drainage systems, *Surface runoff, *Riddance (Legal aspects), Drainage water, Surface drainage, Repulsion (Legal aspects), Surface waters, Floods, Artificial watercourses, Storm drains, Tiles, Subsurface drainage, Land tenure, Real property, Damages, Flood damage, Judicial decisions, Legal aspects, Relative rights.

Plaintiff and defendant were adjoining landowners. Plaintiff devoted his land to raising various marketable crops. Defendant erected apartment houses and a drainage system on his land. The drainage system collected all the drainage water on defendant's land and discharged it with great force and volume through a single large pipe onto plaintiff's land causing serious flooding and the accumulation of debris. Plaintiff sued for damages. In holding for plaintiff, the court acknowledged that the common law rule enabling a landowner to protect himself from surface waters prevailed in Virginia. However, the privilege could not be exercised wantonly or unnecessarily, and a landowner could not use his property so as to injure the rights of another. Thus, a landowner could not collect surface water into an artificial channel and cast it in greatly increased or unnatural quantities upon his neighbor's land even if the quantity was no greater than what would have been received in a more dispersed manner. O'BARR V DUNCAN (RIGHT TO MAINTAIN DAM).

2 SE2d 82-83 (Ga 1939).

Descriptors: *Georgia, *Dams, *Obstruction to flow, *Easements, Streams, Surface waters, Running waters, Shallow waters, Earth dams, Barriers, Damsites, Land use, Real property, Farm management, Legal aspects, Judicial decisions, Riparian rights, Maintenance, Water levels, Relative rights.
Identifiers: *Fords.

Plaintiff upstream property owners sought an injunction against defendant downstream riparian owner to prohibit the maintenance of a dam on the stream which ran through their properties. Plaintiffs contended that they were prohibited from full use of their peoperty by the fact that defendant's dam caused the stream water to back up so as to interfere with a ford used by the plaintiffs. Defendant admitted maintaining the dam but claimed that his predecessors in title had also done so and that his dam was no different than the earlier one. Defendant claimed that an easement for the maintainance of the dam was reserved by his grantors and that non-use of such easement did not constitute abandonment as argued by plaintiff. In affirming the trial court's decision for the defendant, the Supreme Court of Georgia ruled that non-use did not mean abandonment of an easement and that the reservation of an easement was equivalent to an express grant of one. The court held that the evidence established that defendant did in fact have such an easement for maintaining a dam. (Barker-Florida)

FRADY V CAROLINA MOUNTAIN POWER CORP (LIABILITY FOR FLOOD DAMAGE DUE TO OPENING FLOODGATES).

196 SE 817-818 (NC 1938).

Descriptors: *North Carolina, *Dams, *Overflow, *Floodgates, Upstream, Streams, Damages, Lakes, Water injury, Flooding, Floodwater, Streamflow, Judicial decisions, Legal aspects, Rain, Rainfall, Rain water, Water storage, Standards, Regulation, Precipitation excess, Flood damage.

Defendant power company operated a dam about eight miles upstream from plaintiff's land. Rain water gradually accumulated in a lake above the dam until such water was overflowing a portion of the dam. In order to release the impounded water from the lake, defendant opened the flood gates of the dam, thereby releasing great volumes of water from the lake and into a stream below, which was already in a swollen condition. As a result of this increased amount of water, the stream overflowed onto plaintiff's land, causing damages to the land and the crops thereon. Plaintiff instituted proceedings to recover damages due to defendant's negligent operation of the dam. In a per curiam opinion, the appellate court affirmed the lower court's judgement for plaintiff. (Finman-Florida)

HASKELL V STATE (IMPROPER CONTROL OF CANAL FLOODGATE).
283 NY 612, 28 NE2d 27-28 (1940).

Descriptors: *New York, *Flood damage, *Floodgates, *New York State Barge Canal, Canal design, Canal construction, Design flow, Gates, Transportation, Engineering structures, Overflow, Control structures, Real estate, Flood control, Damages, Judicial decisions, Legal aspects, State government.

Plaintiff, as executrix of claimant's estate, brought action to recover for damages to claimant's lands, seawall, and shrubbery which was caused by flood waters from the lake on which the lands bordered. The lake constituted part of a barge canal system. Plaintiff contended that a floodgate and guard gate constructed and operated by the state to control an outlet from the lake were of inadequate size to exercise flood control. Furthermore, plaintiff alleged that the outlet gates had been closed when they should have been opened to permit the flow of water. The court, in a per curiam decision, affirmed the trial court's judgement for plaintiff. (Hubener-Florida)

UNION DRAINAGE DIST NO 5 V HAMILTON (ASSESSMENT AGAINST PROPERTY HOLDER FOR DRAINAGE IMPROVEMENT).
390 Ill 487, 61 NE2d 343-348 (1945).

Descriptors: *Illinois, *Drainage systems, *Tile drains, *Repairing, Drainage districts, Drainage, Surface drainage, Drainage programs, Surface waters, Controlled drainage, Culverts, Surface runoff, Diversion, Natural flow doctrine, Ditches, Drains, Diversion structures, Legislation, Legal aspects, Judicial decisions, Federal government, Roads, Outlets, Administrative agencies, Adjudication procedure.

Plaintiff drainage district sought confirmation of an assessment against defendant for repairs of a tile drainage system. The network had been built by the W.P.A., and plaintiff contended that the repairs were necessary to bring the system up to the level of efficiency contemplated by the original plans. Defendant argued that the network of drainage ditches was functioning properly and that the plaintiffs were attempting to discredit the reputation of the drainage district commission which had supervised the original construction. Defendant had been a member of that commission. Defendant further argued: that the proposed improvements would constitute an unlawful diversion of surface waters over his land, that the improvements would become clogged with quicksand in the same manner as the old, and that plaintiff had failed to show that sufficient outlets for the drainage were included in the plans. In affirming the trial court's judgment for plaintiff, the Supreme Court of Illinois held that defendant's objections were properly submitted to the jury and that the verdict was within the range of testimony offered at trial. FRAZIER V VILLAGE OF WESTERVILLE (LIABILITY FOR FLOOD DAMAGES CAUSED BY DAM).

36 NE2d 812-819 (Ohio Ct App 1941).

Descriptors: *Ohio, *Damages, *Cities, *Obstruction to flow, Dams, Ditches, Drains, Pipes, Tile drainage, Drainage engineering, Judicial decisions, Legal aspects, Overflow, Flood damage, Rain water, Riparian rights, Streams, Water works, Banks, Dikes, Retaining walls, Relative rights.

Plaintiffs and defendant village owned land bordering a stream. Defendant constructed a permanent concrete dam and dikes across the stream for the improvement of its waterworks which subsequently caused the stream to overflow plaintiffs' land. Plaintiffs brought suit for damages. Defendant contended that the flood was due to an act of God as a result of excess rainfall, and consequently the flooding was entirely beyond its control. Also defendant contended that plaintiffs were not the owners of the property at the time the improvements were made, thus the cause of action did not inure to them but rather inured to plaintiffs' grantors. The court found no evidence to support the defence of an act of God in the high water and flood conditions were not so unusual or unexpected as to be unforseen by defendant when constructing the improvements. The court found that construction of the improvements was no completed until after plaintiffs had acquired their land, so plaintiffs did have a cause of action for damages. In holding for plaintiffs, the court found the measure of damages to be the difference between the value of the property before the injury and the market value of it after the injury. STOER V OCALA MFG ICE AND PACKING CO (RIGHTS AND OBLIGATIONS OF LOWER RIPARIAN OWNERS).
24 So 2d 579-581 (Fla 1946).

Descriptors: *Florida, *Alteration of flow, *Natural flow doctrine, *Surface waters, Obstruction to flow, Surface drainage, Natural flow, Riparian land, Relative rights, Agriculture, Cultivated lands, Carrying capacity, Drainage practices, Irrigation canals, Irrigation ditches, Dams, Dikes, Bridges, Drainage districts, Watercourses (Legal), Natural streams, Riparian rights, Diversion structures, Legal aspects, Judicial decisions.

Plaintiff, a lower riparian landowner, sought to enjoin defendant corporation from alternately storing and releasing surface water through the use of wells, dams, culverts, gate valves, ditches, and dikes. Plaintiff contended that defendant's actions altered the natural flow of the river and caused inundation and damage to his property. Defendant contended that the damage was a result of the plaintiff's having built fences, low bridges, and foot logs over the river bed causing hyacinths and drift to collect and retard the flow and carrying capacity of the river. The court acknowledged as settled law that an upper proprietor may drain surface water from his lands into a natural watercourse, but is not permitted to collect and impound quantities of water and discharge it into a natural watercourse in such a way as to overtax it and inundate lands of a lower proprietor. However, plaintiff was in a cooperative drainage area and had a duty to keep his waterways open. Plaintiff had been negligent, and therefore was not entitled to relief. (Price-Florida)

MILLER V ERVIN (DAMAGES RESULTING FROM DRAINAGE DITCH CONSTRUCTION).
6 So 2d 910-914 (Miss 1942).

Descriptors: *Mississippi, *Ditches, *Railroads, *Right of way, Civil engineering, Transportation, Drainage, Excavation, Water conveyance, Surface waters, Damages, Overflow, Flooding, Construction, Grading, Landfills, Construction costs, Costs, Alternative costs, Comparative costs, Total costs, Absorption, Judicial decisions, Legal aspects.

Plaintiff land owner brought suit against defendants, receivers of a railroad, for damages to her land which resulted from overflow from a pond. The damages allegedly occurred when defendants dug a ditch on the railroad right-of-way. Plaintiff claimed that the ditch increased the velocity of accumulation in the pond which resulted in its overflowing and that prior to the digging of the ditch, a great deal of the surface water had been absorbed by the roadbed. Defendants argued that the ditch excavation was a reasonable use of their right-of-way and that no other method of improving the railroad's operation could have been employed as efficiently or cheaply as getting the needed fill from a ditch. The Supreme Court of Mississippi ruled that the railroad would only be held liable for damages caused by the resulting overflow if it could be shown that another method of securing fill for its roadbed would have been equally safe, convenient, and inexpensive as the one used. The trial court's judgment for the defendants was affirmed. (Barker-Florida)

DADE COUNTY V SOUTH DADE FARMS, INC (INJUNCTION AGAINST REMOVAL OF DAM).
182 So 858-862 (Fla 1938).

Descriptors: *Florida, *Dams, *Drainage, *Natural flow, Natural flow doctrine, Alteration of flow, Diversion, Surface waters, Obstruction to flow, Right of way, Local governments, Legal aspects, Surface drainage, Drainage systems, Diversion structures, Ditches, Culverts, Laterals, Dikes, Judicial decisions, Relative rights, Drainage density.

Plaintiff agricultural corporation sought an injunction against defendant county to prohibit removal of a dam built by plaintiff. Defendant had constructed a road on its right of way through plaintiff's land and had provided culverts beneath the road for drainage. Plaintiff claimed that the drainage system had gathered surface waters at an increased rate and had diverted the water onto his land causing unnatural flooding. To alleviate this flooding plaintiff dammed the culvert and opened a ditch to provide for less harmful drainage. Defendant argued that building the dam was unauthorized and had caused damage, expense, and inconvenience to them. Defendant further claimed that plaintiff infringed on its sole right to control drainage on the site. In affirming the trial court's granting of plaintiff's injunction, the Supreme Court of Florida ruled that no person has the right to gather surface waters, divert them from their natural flow and cast them on the land of another. The court also found that as a result of plaintiff's dam, the land enjoyed better drainage than before the dam. (Barker-Florida)

OPTIMIZATION OF THE STREAM FLOW REGULATION BY THE HYDROELECTRIC STATIONS RESERVOIRS WITH THE HELP OF MATHEMATICAL MODELS,
Akademiya Nauk SSSR.
L. S. Belyaev, and Y. P. Syrov.
13th Congress International Association Hydraulic Research, Proceedings, Vol 1, p 17-23, Aug-Sept 1969. 7 p, 12 ref.

Descriptors: *Reservoir operation, *Mathematical models, Reservoir storage, Scheduling, Streamflow, Optimization, Calculations, Foreign research, Hydroelectric plants, Hydroelectric power, Digital computers, Analytical techniques, Algorithm, Water resources, Electric power demand, Planning, *River regulation.
Identifiers: Hydroelectric resources, USSR, *Analytical method, *Hydrologic models, *Streamflow regulation.

Mathematical models and optimization methods for yearly and multiple-year flow regulation of hydroelectric station reservoirs of power and water resource systems are given. Different qualitites of initial information lead to corresponding mathematical models and methods. Because strict probabilistic methods are extremely difficult, approximate methods for annual operation of system with numerous hydropower stations are proposed. The methods are based on probabilistic and deterministic calculations of flow regulation. Deterministic calculations can be used with the gradient method and the Pontryagin maximum principal. The dispatch scheduling of multiple-year storage needs special game theory and statistic decisions criteria because of uncertain initial information. A choice solution to the most reasonable operation of power systems with several stations on multiple-year storage is presented. (USBR)

HOLLEY V LOUISIANA RY AND NAVIGATION CO (FLOOD DAMAGES FROM INADEQUATE DRAINAGE CULVERT).

165 So 703-708 (La 1936).

Descriptors: *Louisiana, *Culverts, *Drainage, *Flooding, Damages, Overflow, Floods, Flood damage, Storms, Conduits, Conveyance structures, Engineering structures, Drains, Surface drainage, Surface waters, Railroads, Rain, Cloudbursts, Rainfall intensity, Runoff, Weather patterns, Precipitation intensity, Judicial decisions, Legal aspects.

Plaintiff land owners sought to recover damages from defendant railroad which resulted from flooding caused by the inability of defendant's culvert to carry off accumulated water. Defendant had constructed the culvert as a replacement for a trestle. Plaintiffs alleged that while the trestle had existed, their land was not subject to overflow from rainfall and that the culvert was inadequate to provide normal flow. Defendant argued that the rainfall which caused the flooding was phenomenal in amount and that the culvert was of equal capacity as the channel below it so that the flooding would have occurred regardless of the culvert. Expert and lay testimony presented by both parties was greatly in conflict. In reversing the trial court's verdict for the plaintiffs, the Supreme Court of Louisiana ruled that since the culvert was capable of carrying all the water which could have been drained by the lower channel, the damage caused to plaintiffs' crops and land was the result of phenomenal rain, not the replacement of the trestle by defendants. MCCUTCHEN V VILLAGE OF PEEKSKILL (RIGHT TO DISCHARGE SURFACE WATERS INTO NATURAL WATERCOURSE.

167 Misc 460, 3 NYS2d 277-280 (Sup Ct 1938).

Descriptors: *New York, *Surface drainage, *Surface run-off, *Riparian rights, Land drainage, Natural streams, Ditches, Aqueducts, Bridges, Drainage effects, Drainage water, Surface water,

verland flow, Precipitation excess, Obstruction to ow, Relative rights, Sewers, Drainage systems, Ci- es, Overflow, Flooding, Flood damage, Flow aug- entation, Judicial decisions, Legal aspects.

aintiff brought action against defendant village to cover for damages which occurred when a brook, hich ran through the village and adjacent to plain- ff's property, overflowed. Defendant drained its rface waters through sewers into the brook and id constructed, pursuant to an agreement with aintiff's grantors, a highway over the part of the rook abutting plaintiff's property. Neither the ow nor the course of the brook was altered by this onstruction. Defendant later constructed addi- onal drainage sewers, and the state constructed a aduct. Surface water therefrom was discharged nto the brook. During heavy rains, the capacity of ne brook was insufficient to accomodate the sur- ace waters drained therein. The court held that the illage was under no duty to prevent the overflow f the brook. However, although a riparian lan- owner has a right to drain surface water into a tream which is the natural outlet for such water, e is liable for damages resulting from his overtax- ng of such stream's capacity. The burden was on laintiff to establish that the flooding was caused by efendant's construction of artificial channels. The vidence did not show the construction of the ewers and highway to be the cause of the overflow. Consequently, judgement for defendant was ranted. (Price-Florida)

FLOOD PLAIN INFORMATION OF ALKALI CREEK - VOLUME II, BILLINGS METROPOLITAN REGION, MONTANA.
Corps of Engineers, Omaha, Nebr.

US Army Corps of Engineers Flood Plain Report, October 1969. 18 p, 2 plate, 2 tab.

Descriptors: *Floods, *Flood damage, *Montana, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood.
Identifiers: Billings (Mont), Standard project flood, Intermediate regional flood.

Flooding of Alkali Creek, Billings, Montana is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. ROUTING MODIFICATIONS TO SUBURBAN DESIGN HYDROGRAPHS,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
Brian M. Reich.
Preprint 1141, Proceedings, American Society Chemical Engineers Natural Water Resources Engineering Meeting, Memphis, Tenn, Jan 26-30, 1970. 26 p, 12 fig, 1 tab, 22 ref. OWRR Project No B-010-PA.

Descriptors: *Flood forecasting, *Urbanization, *Routing, *Flood control, Open channel flow, Computer programs, Flood routing, Hydrographs, Hydrograph analysis, Planning, Mathematical models, Storm runoff.
Identifiers: Storm runoff planning.

Stormwater disposal in heterogeneous watersheds that typify modern suburban developments involves the routing of flood flows which arise on first- and second-order tributaries. Streamflow measurements are absent so that the input to the routing must be synthetic hydrographs. Urban and rural hydrographs generated from drainage basin features and a hypothetical rain are combined and routed through streams and proposed reservoirs so that effective use may be planned for the valley bottoms downstream. The influence of deep, narrow flood channels as opposed to broad park-like swales must be studied through the application of routing calculations based upon hydraulic properties. Four watersheds in the fringe suburbs of Philadelphia, Penn., were studied as examples of the suburban setting common to the Northeast. Neither channel routing nor reservoir routing obliterate hydrograph differences. The very small improvement in flood control achieved by combining flat parabolic swales rather than deep rectangular channels with reservoirs may be omitted from considerations on using riparian land for business enterprises. (See also W70-07981) (Knapp-USGS)

WARGO V CONNECTICUT LIGHT AND POWER CO (RELEASE OF IMPOUNDED WATERS AS A RESULT OF NEGLIGENTLY CONSTRUCTED FLASHBOARDS).

127 Conn 629, 18 A2d 924-927 (1941).

Descriptors: *Connecticut, *Hydroelectric plants, *Impounded waters, *Dam failure, Floodgates, Impoundments, Dams, Diversion, Alteration of flow, Obstruction to flow, Riparian rights, Relative rights, Legal aspects, Judicial decisions, Natural flow doctrine, Spillways, Snowmelt, Floods, Floodwater, Damages, Excessive precipitation, Legislation, Rivers, Reasonable use.
Identifiers: *Causation (Legal), *Freshets.

Due to heavy rains and melting snow, there was a freshet in the Housatonic River. Plaintiffs, who were situated a mile below the dam of defendant hydroelectric developer, had their lands damaged and their cottages swept away when flashboards on the dam gave way, thereby releasing the impounded waters. Plaintiffs brought action alleging negligence in the construction and operation of the dam. They contended that defendant was negligent in constructing the flashboards without the permission required by statute, and that such negligence was the proximate cause of their injury. Defendant argued that plaintiff had not proved by the evidence that the damage was not an act of God due to the freshet. The appellate court, in holding for plaintiffs, found the evidence sufficient to support the finding of negligence on the part of the defendant. An upper proprietor upon a stream has no right to gather and impound waters and then sud-

denly release them onto the land of lower proprietors. Each riparian owner is limited to reasonable use of water with due regard to rights of other such owners. It is the common right to have the stream preserved in its natural size, flow and purity without material diversion. (Marsee-Florida)
W70-08550

YATES V METROPOLITAN GOV'T OF NASHVILLE AND DAVIDSON COUNTY (WATER DAMAGE FROM IMPROPER CONSTRUCTION OF FACILITIES).

451 SW2d 437-444 (Tenn Ct App 1969).

Descriptors: *Tennessee, *Easements, *Cities, *Drainage, Diversion, Surface waters, Water works, Pumping, Damages, Ditches, Roads, Paving, Structures, Alteration of flow, Public benefits, Repairing, Engineering structures, Discharge (Water), Public rights, Utilities, Graded, Local governments, Judicial decisions, Legal aspects.

Plaintiff brought action against defendant city for water damage to his property allegedly resulting from the improper construction or maintenance of facilities on an easement adjoining plaintiff's land. Drainage ditches associated with defendant's easement intercepted the natural drainage flow of surface water and diverted it in an unnatural flow upon plaintiff's property. The issues on appeal from a decision for defendant were: (1) was the city liable for damages where it was operating a water system in an easement dedicated to the public, where the surface of the easement constituted a nuisance and damaged a neighboring property owner; and (2) was defendant obligated to remove the diversionary ditch located on the easement. The court held that the city was not liable and that the use of an easement does not entail general maintenance of the land over which it passes unless the holder has made such maintenance necessary by the manner of the use of his easement. The defendant could not be liable where there was no showing that he actually created the nuisance as an incident to the use of his easement. (Barnett-Florida)
W70-08555

S L GARLAND CO V EVERLASTING MEMORIAL WORKS, INC (INJUNCTION AGAINST INTERFERENCE WITH DRAINAGE DITCH).
264 A2d 776-778 (Vt 1970).

Descriptors: *Vermont, *Drainage, *Damages, *Boundary disputes, Boundaries (Property), Legal aspects, Water law, Ditches, Drainage systems, Surface waters, Obstruction to flow, Barriers, Land use, Judicial decisions, Conveyance structures, Flood damage, Remedies, Relative rights.
Identifiers: Injunction (Prohibitory).

Following a lengthy dispute over a common boundary, plaintiff brought action for trespass, alleging that defendant corporation had encroached upon its land by construction of a building and installation of underground tanks. Defendant counterclaimed alleging that plaintiff wrongfully obstructed and destroyed a drainage ditch designed to carry off water from the properties of both parties. Defendant claimed that as a result, great quantities of water were diverted onto defendant's land causing damage to its plant, facilities, and products and impeding access to the plant. The Supreme Court of Vermont ruled that dismissal of plaintiff's suit was proper since the resolution of the boundary dispute was in favor of defendant. In addition, the court held that the equitable relief of injunction against plaintiff's interference with the drainage was appropriate and within the jurisdiction of the trial court. (Barker-Florida)
W70-08557

FOREST CITY COTTON CO V MILLS (ACCUMULATION OF SEDIMENT IN TRIBUTARY OF DAMMED RIVER AS CREATING DRAINAGE OBSTRUCTION).

219 N C 279, 13 SE2d 557-561 (1941).

Descriptors: *North Carolina, *Mill dams, *Deposition (Sediments), *Reasonable use, Bed load, Bottom sediments, Damages, Legal aspects, Judicial decisions, Natural flow doctrine, Riparian land, Riparian rights, Riparian waters, Natural streams, Impounded waters, Impoundments, Tributaries, Sedimentation, Sediment transport, Sedimentation rates, Remedies, Adjudication procedure, Sands, Ponding.

Plaintiff owned land on a tributary of the river on which defendant operated a mill dam. Plaintiff's land was eight miles above the dam. Plaintiff contended the dam had impeded the flow of the river, which had in turn impeded the flow of the tributary, and that sand and debris were thereby caused to accumulate in the tributary. This made it impossible to drain plaintiff's land. The case was tried in the lower court on the theory of permanent damages, allegations of negligence being eliminated. The appellate court affirmed, finding the evidence sufficient to support the verdict for the defendant. The dissenting opinion urged that the lower court had committed reversable error by instructing the jury concerning the reasonable use doctrine. That doctrine properly applies to lower riparian owners, and here plaintiff was an upper riparian owner. The dissent felt that when a lower owner constructs a dam which causes injury to an upper proprietor, the lower owner becomes liable for injury whether he operates his dam reasonably or unreasonably. (Price-Florida)
W70-08559

NATCHER V CITY OF BOWLING GREEN (COMPENSATION FOR INTERFERENCE BY DAM CONSTRUCTION WITH RIPARIAN RIGHTS).
264 Ky 584, 95 SW2d 255-260 (1936).

Descriptors: *Kentucky, *Riparian rights, *Navigation, *Eminent domain, Dams, Beneficial use, Navigable rivers, Bodies of water, Surface waters, Beds, Ownership of beds, Reservoirs, Riparian waters, Dam construction, Damages, Damsites, Cities, Water resources development, Judicial decisions, Gravels, Beds under water, Municipal water, Compensation, Local governments.

Plaintiff landowner sought removal of a dam which had been constructed by defendant city. Plaintiff owned two gravel bars in a river used by the city as its municipal water supply. When the dam was constructed, the water level of the river was raised and plaintiff could no longer gain access to the bars. Plaintiff argued that defendant had no power to destroy his access to the bars but, if so, then the city was required to compensate him for his loss. Defendant claimed the authority to build the dam through its power to improve navigability of the river and that such action required no compensation of riparian owners. The Court of Appeals of Kentucky, reversing the trial judgment for the city, found that mere expression of increased navigability was insufficient to justify interference with riparian rights where the facts showed no such improvement in navigation. The city could justify the dam construction on the grounds of increasing the municipal water supply and could utilize the eminent domain process to achieve that purpose, but riparian owners had to be compensated for loss of their riparian rights. (Barker-Florida)
W70-08565

COOPER V WILSON (DAMAGES FROM STREAMFLOW DIVERSION).
271 Ky 74, 111 SW 2d 436-437 (1937).

Descriptors: *Kentucky, *Obstruction to flow, *Alteration of flow, *Diversion, Damages, Relative rights, Dams, Natural flow doctrine, Streamflow, Streams, Running waters, Surface waters, Valleys, Barriers, Diversion structures, Judicial decisions, Legal aspects, Brush, Overflow, Flooding.

Plaintiff landowner brought action to recover damages caused his property by defendant's diversion of a stream. The stream ran through the property of bothparties. Plaintiff contended that defendant had constructed a brush dam which caused the water from the stream to overflow onto plaintiff's land, thus flooding a certain portion thereof. Defendant argued that he was merely seeking to avoid damages caused by plaintiff's erection of a fence on the stream. The fence accumulated debris carried by the stream, backed up the flow of the stream, and diverted it onto defendant's property. The Court of Appeals of Kentucky, in affirming the trial court's judgment for the defendant, ruled that in an action for damages from diversion of a natural stream, a defendant is relieved of liability when such diversion is performed only to protect against damages caused by a plaintiff who has also diverted the natural flow of the stream. (Barker-Florida)

EVANS V MASSMAN CONST CO (FLOODING RESULTING FROM CONSTRUCTION OF DIKE UPON NAVIGABLE RIVER).
122 SW2d 924-936 (Mo 1938).

Descriptors: *Missouri, *Dikes, *Floods, *Flood damage, Engineering structures, Structures, Barriers, Levees, River training, Overflow, Damages, Federal government, Project planning, River regulation, Rivers, Navigable rivers, Engineering, Backwater, Judicial decisions, Legal aspects.

Defendant construction company, under a government contract and pursuant to a governmental plan, built a dike to improve the navigation of the Missouri River. In an action to recover damages for flooding, plaintiff contended that defendant had negligently constructed the dike which led to a retardation of the river's flow which resulted in the river overflowing its banks so as to inundate plaintiff's land. Plaintiff proceeded under two theories. First, plaintiff contended that defendant was negligent in planning and supervising the construction of the dike. Second, plaintiff contended that defendant was negligent in not building the dike according to the government's specifications. The court held that defendant was not liable for negligent planning and supervision since under the contract the government was responsible for planning and supervising. The court held further that plaintiff failed to establish that defendant's negligence, if any, was the proximate cause of the flooding in that it was not shown that the flooding could not have occurred even though the dike had not been built. The jury verdict for plaintiff was reversed. (Snow-Florida)
W70-08570

FISHER V ARKANSAS POWER AND LIGHT CO (NEGLIGENT RELEASE OF IMPOUNDED WATERS BY DAM OWNER).
150 SW2d 959-962 (Ark 1941).

Descriptors: *Arkansas, *Dams, *Discharge (Water), *Impounded waters, Damages, Floods, Surface water, Reservoirs, Reservoir operation, Operations, Water control, Water supply, Impoundments, Gates, Flood damage, Engineering structures, Judicial decisions, Legal aspects, Water storage, Spillway gates, Gate control, Hydroelectric plants, Hydroelectric power, Land tenure.

Plaintiffs, downstream landowners, sought to recover damages to their properties resulting from defendant power company's operation of dams. Plaintiffs contended that the operation of the dams was carried on negligently in that large quantities of water were released through the gates of the dams, thus flooding plaintiffs' properties. Defendant denied negligence in the operation of the dams. The Supreme Court of Arkansas, in affirming the trial court's verdict for defendant, ruled that in the absence of a finding of negligence, a dam owner has the right to release impounded waters at such times and in such quantities as are reasonably necessary for the operation of the dam. Downstream property owners hold their land sub-

:t to these rights of the dam owner. Since no find- g of negligence was made at trial, defendant was t liable for the damages to plaintiffs' lands. arker-Florida)

RASSY LAKE AND TYRONZA DRAINAGE ST NO 9 OF MISSISSIPPI COUNTY V RAINAGE DIST NO 17 OF MISSISSIPPI OUNTY (JOINT FUNDING FOR LEVEE CON- 'RUCTION).
0 SW2d 1007-1012 (Ark 1943).

escriptors: *Arkansas, *Drainage districts, *Con- acts, *Levees, Flood control, Earthworks, Bar- ers, Flood protection, Surface waters, Regions, overnments, Federal government, United States, onstruction, Repayment contracts, Legal aspects, isements, Judicial decisions, Controlled drainage, ainage systems, Water policy, Drainage pro- ams, Drainage engineering.

aintiff drainage district sought specific per- rmance of a contract executed between it and de- ndant drainage district. The contract provided at defendant would furnish part of the cost for e construction of a levee to be located wholly thin the boundaries of the plaintiff district. How- er, the levee was designed to protect the land in oth districts from the overflow of a river. The deral government was responsible for the con- ruction of the levee, but sharing of the expense by l benefiting parties was comtemplated. Defendant leged that the entering into the contract to pro- de money for a levee not situated within its boun- aries was an ultra vires act and that the contract ould be declared void. Affirming the lower court ecision for plaintiff, the Supreme Court of Arkan- s ruled that such action taken by a drainage dis- ict was within the scope of the legislation creating e district, and the defense of ultra vires was not roper. The decree granting specific performance f the contract was affirmed. (Barker-Florida)

ARAMORE V STATE (DAM FAILURE AUSED BY UPSTREAM RELEASE OF EXCES- IVELY LARGE QUANTITIES OF WATER AND ESULTING THERMAL EXPANSION OF ICE).
58 App Div 930, 16 NYS2d 551-552 (1939).

escriptors: *New York, *Dam failure, *Thermal xpansion, *Ice loads, Ice, Dams, Blowouts, racking, Rupturing, Discharge (Water), New ork State Barge Canal, Streams, Damages, Judi- ial decisions, Legal aspects, State governments, emedies, Adjudication procedure, Expansion, hannels, Impoundments, Impounded waters, anals, Relative rights.
dentifiers: *Negligence.

Defendant state of New York, without taking into onsideration the fact that the Irondequoit Creek bove claimant's dam was frozen to a depth of bout two feet, released into the Creek from the lew York State Barge Canal large and unusual uantities of water. The large quantities of water nd thermal expansion of ice against the dam aused the dam to fail, and claimant brought action o recover damages. In reversing the lower court ecision for claimant, the appellate court held per uriam that evidence supported a finding of egligence on defendant's part. However, clai- nant's recovery was precluded by his contributory egligence. Claimant had failed to maintain, as he ad done in previous years, a channel in the ice in ront of his dam. Such channel was necessary to ermit excessive quantities of water to flow over he dam and to prevent thermal expansion of ice. (Marsee-Florida)

NIGHTENGALE V STATE (NEGLIGENT IN- CREASE IN FLOWAGE BY STATE).

41 NYS2d 147-148 (App Div 1943).

Descriptors: *New York, *Adjudication procedure, *Alteration of flow, *Flooding, New York State Barge Canal, Remedies, Damages, Livestock, Real property, Legal aspects, Judicial decisions, Canals, Streams, Overflow, Diversion, Land tenure, Flow augmentation, Reservoirs, Streamflow, Water levels, Water level fluctuations, State governments.
Identifiers: *Negligence.

Claimants brought action against defendant state to recover for damages to their real property and livestock caused by overflow and flooding from a creek. Defendant had diverted water from a feeder canal through the creek and into a reservoir for the New York State Barge Canal. The increased flow through the creek resulted in claimants' damages. The lower court dismissed claimants' action on the ground that claimants had not proved any negligence on the part of defendant. The appellate court reversed, holding that the evidence was sufficient, if uncontradicted or unexplained, to warrant a finding that defendant was liable. Findings to the contrary made by the lower court were against the weight of the evidence. (Marsee-Florida)

THE USE OF GRAVITY SHAFTS FOR GROUNDWATER RECHARGE - PHASE I,
North Dakota Water Resources Research Inst., Fargo.
T. R. d'Errico, and M. T. Skodje.
Available from the Clearinghouse as PB-192 762, $3.00 in paper copy, $0.65 in microfiche. Research Project Technical Completion Report, Water Resources Research Institute WI-222-003-70, January, 1970. 22 p, 2 tab, 8 fig. OWRR Project B-008-NDAK (1).

Descriptors: Laboratory tests, Permeability, Turbidity, *Sedimentation, *Shafts (Excavations), Groundwater recharge, North Dakota.
Identifiers: Sheyenne River (North Dakota), *Gravity recharge, Sand-filled shafts, Clogging patterns, Air-binding.

The hydraulic characteristics of shafts consisting of uniformly graded sand were studied in the laboratory to predict their applicability for the recharge of glacially deposited aquifers overlain with impervious soils. Water containing various levels of turbidity was applied to shafts consisting of three different sizes of sand. Piezometers were used to measure the head-loss gradients. At the completion of each test, the amount of sediment trapped in the different levels of the shaft was determined. Permeabilities of the three sand sizes using clear tap water were observed to be 14,400, 4,500, and 3,400 GPD per square foot. No 'airbinding' of the shafts was noted, and the clogging of the shafts was limited to the upper three inches of the shaft. Below this layer the permeability remained constant. Field tests should be conducted to determine whether periodic restoration of the upper level of the shaft is more economical and practical than shaft abandonment and replacement. Two different shaft designs are proposed for use with these two methods of operation. The permeability of the shaft is decreased more rapidly when higher turbidities are applied. Sedimentation of the Sheyenne River water as a method for reducing the sediment loading does not appear practical except during high river stages when turbidities exceed 100 mg per liter.

USE OF GROUNDWATER FOR IRRIGATION, SEWARD COUNTY, NEBRASKA,
Nebraska Univ., Lincoln. Conservation and Survey Div.
J. M. Jess.
Nebraska Water Survey Paper 25, University of Nebraska, March 1970. 24 p, 4 fig, 5 tab, 7 ref, append.

Descriptors: *Groundwater, *Water utilization, *Withdrawal, *Nebraska, *Irrigation water, Water resources, Water wells, Water yield, Aquifers, Water costs, Economics.
Identifiers: Seward County (Neb).

Irrigation is the principal use of groundwater in Seward County. Domestic, stock, and public supply requirements additionallly contribute to the total demand for groundwater. Increased groundwater use has resulted in a general decline of groundwater levels (3 to 10 feet), mostly in upland areas. Irrigation with groundwater has developed rapidly in Seward County. Pump irrigation has made possible a vigorous, expanding economy. In 1968, 550 wells supplied water to irrigate about 56,000 acres. Average amount of water pumped per well was 76.8 acre-feet. Average pumping cost per acre-foot was $19.60. Corn is planted to 59 percent of the irrigated acreage. Average corn yield was 115 bushels per acre compared to 60 bushels on dry land. Net returns, in dollars, of irrigated and nonirrigated crops are compared. (Knapp-USGS)

WATER RELATIONS OF A PROFILE-MODIFIED SLOWLY PERMEABLE SOIL,
Agricultural Research Service, Bushland, Tex. Southwestern Great Plains Research Center.
Paul W. Unger.
Soil Science Society of America Proceedings, Vol 34, No 3, p 492-495, May-June 1970. 4 p, 6 tab, 11 ref.

Descriptors: *Infiltration, *Aeration, *Soil water movement, *Deep tillage, *Soil management, Soil texture, Land management, Retention, Storage capacity, Soil strength, Porosity.
Identifiers: Southern High Plains (Tex).

A study was conducted with samples obtained from Pullman silty clay loam modified to 90 and 150 cm with a large ditching machine to determine the potential for increasing water intake, retention, and storage by profile modification, and to characterize the modified soil. Profile modification to 90 and 150 cm effectively disrupted the slowly permeable horizon of Pullman soil. Soil bulk density and strength were significantly decreased, and soil porosity was significantly increased. Unmodified soil retained more water on a volumetric basis than modified soil at 1/3- and 15-bars tension, but plant-available water as estimated from the 1/3- and 15-bar values was not altered by modification. The lower water contents of the modified soil at low tensions provided for potentially greater aeration. Water entered modified soil more rapidly than unmodified soil under field conditions. STATISTICAL ANALYSIS OF GROUNDWATER USE AND REPLENISHMENT,
Missouri Univ., Rolla. Dept. of Geological Engineering; and Colorado State Univ., Ft. Collins. Dept. of Geology.
John D. Rockaway, Jr., and Robert B. Johnson.
Water Resources Bulletin, Vol 6, No 3, p 408-423, May-June 1970. 16 p, 8 fig, 8 ref.

Descriptors: *Water resources development, *Groundwater, *Water table, *Hydrogeology, *Statistical methods, Water levels, Potentiometric level, Indiana.
Identifiers: *Trend surface analysis.

A statistical technique which offers considerable promise in groundwater studies is the fitting of polynomial trend-surfaces to groundwater data and studying the variations in the surfaces and the residuals from these surfaces over a period of time. The application of trend-surface analysis to groundwater study is based on the premise that the piezometric surface or water table can be approximated by a mathematically computed polynomial surface of the water levels of the wells in the aquifer. The evaluation of trend surface analysis application in groundwater investigations involves a study of the relationship existing between the trend surfaces and the actual groundwater surface and a study of the potential use of the residuals from the trend-surfaces to assist in the location of favorable sites for future development of groundwater resources. The conclusions from the trend surface analysis were compared with conclusions from an independent survey of groundwater conditions. (Knapp-USGS)

BROCK V PORTER (RIGHTS TO WELL WATER PURSUANT TO WRITTEN CONTRACT).

220 N C 28, 16 SE2d 410-411 (1941).

Descriptors: *North Carolina, *Water contracts, *Wells, *Domestic water, Water utilization, Assessments, Claims (Contracts), Contracts, Compensation, Fixed costs, Supply contracts, Legal aspects, Judicial decision, Grants, Relative rights, Adjudication procedure, Water rights, Land tenure, Real property.

The plaintiff and the defendant were adjacent landowners. Pursuant to a written contract between the plaintiff and the defendant's successors in title, the plaintiff granted well water rights for household purposes to the then owners of the land and to subsequent parties occupying the land. Payment for the water rights was to be one dollar per month. There was one dwelling house on the premises when the defendant bought the property. The defendant subsequently constructed a second dwelling house thereon and sought to use the well water for this house also. Plaintiff brought action to determine the rights under the contract. The lower court held that the plaintiff was required to furnish water for one dwelling only. The appellate court reversed, holding that the contract was clear on its face. The plaintiff was to furnish water for household use to the occupiers of this land without limit as to the number of dwellings to be served. (Price-Florida)

LEE V MUT BENEFIT LIFE INS CO (PRESCRIPTIVE RIGHT TO USE OF WELL).
187 SE 66 (Ga 1936).

Descriptors: *Georgia, *Prescriptive rights, *Easements, *Water wells, Land tenure, Real property, Water supply, Competing uses, Relative rights, Water demand, Water utilization, Wells, Subsurface waters, Percolating water, Adjudication procedure.

Plaintiff sought to establish a right to use water from a well owned by defendants. The court held that the allegation that defendants knew that plaintiffs were using water from the well was not sufficient to show an easement by prescription in the well. The allegation was insufficient and immaterial without further evidence tending to show that plaintiff had an easement. The court dismissed the petition on a general demurrer. (Hubener-Florida)

WATER RESOURCES OF THE ARID LANDS,
Aberdeen Univ. (Scotland).
Kenneth Walton.
In: The Arid Zones, Chapter 5, p 101-115. Chicago, Aldine Publishing Company, 1969. 175 p, 11 fig, 185 ref.

Descriptors: *Arid lands, *Water resources, *Surface waters, *Subsurface waters, *Aquifers, Groundwater, Perennial streams, Water resources development, Hydrogeology, Water sources, Groundwater basins, Groundwater recharge, Groundwater reservoirs, Deserts, Water yield, Saline water, Salinity, Limiting factors.

This chapter deals with groundwater and perennial rivers, the two major sources of moisture for arid lands. The author discusses the origin, structure, and location of the various aquifers of the arid zones. He considers sustained yield and saline water the most important problems to be confronted when developing desert aquifers. Arid lands which are watered by perennial streams are touched on briefly. These areas, such as the lands along the Tigris-Euphrates, Nile, Indus, and Colorado-Gila, use dams and other devices to even out the moisture regimes of rivers and thereby regulate the availability of water. There is no doubt that water and its availability will continue to be the determining factor in the development of deserts. (Carr - Arizona)

THE RAFT RIVER BASIN, IDAHO-UTAH, AS OF 1966: A REAPPRAISAL OF THE WATER RESOURCES AND EFFECTS OF GROUNDWATER DEVELOPMENT,
Geological Survey, Boise, Idaho.
E. H. Walker, L. C. Dutcher, S. O. Decker, and K. L. Dyer.
US Geological Survey Open-file report, April 1970. 116 p, 23 fig, 11 tab, 27 ref.

Descriptors: *Hydrogeology, *Groundwater basins, *Idaho, Aquifers, Irrigation water, Water resources development, Water levels, Water yield, Water level fluctuations, Irrigation, Water balance, Surface-groundwater relationships.
Identifiers: Raft River Basin (Idaho).

Much arable land in the Raft River Basin, Idaho lacks water for irrigation, and the potentially irrigable acreage far exceeds the amount that could be irrigated with the basin's 140,000 acre-feet estimated annual water yield. Pumping more groundwater is possible only if large additional groundwater storage depletion can be tolerated. Precipitation ranges from less than 10 inches on the valley floor to more than 30 inches at some places in the mountains. Irrigation with groundwater is widely practiced and about 69,000 acres were irrigated partly or wholly with groundwater in 1966. Basalt lavas of the Snake River Group yield water where they occur below the water table. A few wells that penetrate limestone obtain substantial supplies from crevices. Transmissivity of the composite aquifer is estimated to vary from about 10,000 gpd/ft to more than 45,000 gpd/ft. Surface outflow of the Raft River to the Snake River now amounts to only about 1,900 acre-feet per year, a decline of about 15,000 acre-feet a year from the estimated original average outflow prior to irrigation. Consumption of groundwater for irrigation averages about 1.6 feet per acre annually. The depletion of groundwater storage during the years 1952 to 1965 was approximately 410,000 acre-feet. By the end of 1966 it was nearly 515,000 acre-feet. (Knapp-USGS)

SLOSS-SHEFFIELD STEEL AND IRON CO V WILKES (DAMAGES FROM DRAINAGE OF SURFACE AND PERCOLATING WATERS).

165 So 764-772 (Ala 1936).

Descriptors: *Alabama, *Reasonable use, *Relative rights, *Mining, Excavation, Mining engineering, Underground, Underground structures, Safety, Damages, Cracks, Surface waters, Industries, Percolating water, Subsurface waters, Springs, Spring waters, Wells, Judicial decisions, Legal aspects, Water sources, Land use.

Plaintiff land owner sought to recover damages which resulted from defendant corporation's drainage of surface water from springs and wells located on plaintiff's land. Plaintiff alledged that the drainage occurred when the roofs of two mines operated by defendant collapsed, thus destroying the percolating water which served as the supply for plaintiff's springs and wells. It was alleged that such collapse was the result of negligence by defendant. Defendant contended that there was no violation of due care and that the mining operations did not constitute an unreasonable interference with the use of the water by both parties. In reversing the trial court's judgment for the plaintiff, the Supreme Court of Alabama adopted the reasonable use doctrine whereby a land owner has the right to reasonable use of the water on his land even though the underground waters of neighboring property may be interfered with or diverted. The mining operations were held to be a reasonable use of defendant's property. (Barker-Florida)

dentifiers: Grant Junction (Colo), Land conservaon.

he effect of grazing on the hydrology of saltesert type rangeland has been studied near Grand unction, Colo, for the past 14 years. Measureents of precipitation, runoff, erosion, and vegetaon have been made in four pairs of watersheds. Dne of each pair has been grazed by cattle and heep as is normal in the region, and the other has ot been used since the beginning of the study. Measurements made 10 years apart show that all our grazed watersheds have had a slight increase in he amount of bare soil and rock and a decrease in round cover; cover on ungrazed watersheds has emained virtually unchanged. Runoff in the unrazed watersheds has been about 30 percent less han in the grazed watersheds, and sediment yield as been about 45 percent less. The greatest hange in each of the relationships occurred about years after livestock was excluded from one vatershed of each of the pairs. Preliminary studies ndicate that within areas of similar physiography, unoff is directly related to the percentage of bare oil present on a watershed. (Knapp-USGS)

MISSOURI PAC RR V BARRON (LIABILITY FOR FLOODING RESULTING FROM OBSTRUCTION OF STREAM BY RAILROAD BRIDGE).

117 SW2d 15-18 (Ark 1938).

Descriptors: *Arkansas, *Flooding, *Bridges, *Obstruction to flow, Flood damage, Damages, Overflow, Floods, Streams, Judicial decisions, Railroads, Stream flow, Flow, Running waters, Drainage, Alteration of flow, Legal aspects, Judicial decisions.

In an action for damages to realty, plaintiff contended that defendant railroad company maintained a railroad bridge which impeded the natural flow of a stream, which passed through plaintiff's land, and thereby flooded such land. Defendant contended on appeal that the jury verdict for plaintiff was not based on substantial evidence. The court reviewed the record and found testimony to the effect that the trestle of the bridge was so constructed down into the bank of the stream so as to reduce the size of the channel through which the water flowed, resulting in an obstruction to the free flow of the stream. Such evidence was held to be substantial enough to support the jury's verdict. (Snow-Florida)

In: Water Studies in Oregon, Oregon State University Water Resources Research Institute Fall Quarter 1969 Seminar WR 012.69, Corvallis, p 55-68, January 1970. 14 p, 4 fig, 16 ref.

Descriptors: *Watershed management, *Lumbering, *Water yield improvement, *Water pollution control, Hydrographs, Rainfall-runoff relationships, Soil-water-plant relationships.
Identifiers: *Forest hydrology.

Oregon State University School of Forestry forest watershed management projects reviewed include: (1) comparative water use of different forest stands; (2) the relationship between forest cutting and peak stream-discharges; (3) logging and effects on sediment production; and (4) the relationship between vegetative removal and the water temperature regimes of small streams. Seasonal differences were found in the amount of water transpired and evaporated by stands of Douglas-fir and Oregon white oak. Logging road building could not be detected in the hydrograph when roads constituted less than about 3.5% of a drainage. Peaks were increased significantly at 7.0% of a drainage area and when clearcutting was a large fraction of a drainage basin. Annual sediment loads varied not only because of changing erosion but also the alterations in streamflow regime. Sediment yields were increased significantly for the first two years after logging. After logging there was no apparent change in temperature characteristics of the patch-cut watershed with streamside strips, whereas the temperature of almost fully exposed streams in completely clearcut areas reached a maximum of 85 deg F, an increase of 28 deg F over the pre-logging maximum. 5A. Identification of Pollutants

AUTOMATED POTENTIOMETRIC TECHNIQUES FOR THE ON-SITE MONITORING OF ANION CONCENTRATIONS IN WATER,
Missouri Water Resources Research Center, Columbia.
Stanley E. Manahan.
Available from the Clearinghouse as PB-192 809, $3.00 in paper copy, $0.65 in microfiche. Completion Report, 1970. 17p, 2 tab, 6 ref. OWRR Project B-023-MO (4).

Descriptors: *Water analysis, *Analytical techniques, *Nitrates, *Electrodes, Ions, Fluorides, Microbiology, Bacteria, Volumetric analysis, Water chemistry, Pollutant identification, *Monitoring.
Identifiers: Ion-selective electrodes, Standard addition, *Potentiometry.

Characteristics of several of the new non-glass ion-selective electrodes and of several reference electrodes were studied in detail with particular emphasis upon the nitrate ion-selective electrode. A new high accuracy standard addition technique for the potentiometric determination of nitrate ion in a cell without liquid junction using the fluoride electrode as a reference was developed. This method eliminates the liquid junction and dilution and activity coefficient changes cancel. The method is applicable to all monovalent anions for which an electrode is available and enables the determination of anion concentrations to within 1% relative accuracy. Low temperature potentiometric titrations of perchlorate and tetrafluoroborate ions with tetraphenylarsonium chloride and ion-selective electrodes were investigated and found to give high accuracy and reasonably good sensitivity for these ions. The nitrate electrode was used to follow nitrate ion concentration in microbial cultures. It was found to be useful for following nitrate ion reduction in situ. (See also W70-08157 thru W70-08160) (Manahan-University of Missouri)
W70-08156

NITRATE ION-SELECTIVE ELECTRODE IN MICROBIAL MEDIA,
Missouri Water Resources Research Center, Columbia.
Stanley E. Manahan.
Applied Microbiology, Vol. 18, p 479-481, Sept., 1969. OWRR Project B-023-MO.

Descriptors: Bacteria, *Nitrates, *Electrodes, *Microbiology, Ions, Nitrites, Pollutant identification, Analytical techniques, *Chemical analysis.
Identifiers: *Ion-selective electrodes.

A nitrate ion-selective electrode has been used to follow the kinetics of the reduction of nitrate to nitrite by a bacillus isolated from the rumen of a sheep. The electrode system and the microbial culture were found to be quite compatible, although the formation of nitrite limits the utility and precision of the measurement. The formation of nitrite was followed simultaneously by a colorimetric method. Nitrate was converted quantitatively to nitrite. The rate of the reaction was found to increase to a plateau value, then drop abruptly when the nitrate was exhausted. (See also W70-08158) (Manahan-University of Missouri)
W70-08157

FLUORIDE ELECTRODE AS A REFERENCE IN THE DETERMINATION OF NITRATE ION,
Missouri Water Resources Research Center, Columbia.
Stanley E. Manahan.
Analytical Chemistry, Vol. 42, p 128-129, January, 1970. OWRR Project B-023-MO.

Descriptors: *Nitrates, *Fluorides, *Analytical techniques, *Water analysis, *Electrodes, Ions, Volumetric analysis, Water chemistry, Pollutant identification.
Identifiers: Potentiometry, Ion-selective electrodes, Standard addition.

The fluoride ion-selective electrode was used as a reference electrode for the standard addition determination of nitrate ion with the nitrate ion-selective electrode. The nitrate electrode was hooked to the measuring side of an expanded-scale pH meter and the fluoride electrode was connected to the reference side. The potential of the fluoride electrode was poised by the addition of a low concentration of fluoride ion to the solution to be measured. At the concentration levels used, the nitrate electrode does not respond to fluoride ion nor does the fluoride electrode respond to nitrate ion. The electrode system is very stable and the liquid junction is eliminated. The concentration of nitrate ion is determined by adding a measured amount of standard nitrate to a known volume of unknown nitrate solution and calculating the original nitrate ion concentration from the shift in potential. Dilution effects and activity coefficient changes cancel. Nitrate ion concentrations in the range 0.00005 to 0.01 M were determined with a relative accuracy

within 1%. The technique is applicable to other monovalent anions for which electrodes are available. (See also W70-08159) (Manahan-University of Missouri)
W70-08158

ION-SELECTIVE ELECTRODES FOR NITRATE ANALYSIS,
Missouri Water Resources Research Center, Columbia.
Stanley E. Manahan.
Proceedings, 3rd Annual Conference 'Trace Substances in Environmental Health-III, University of Missouri, Columbia, p 353-357, June 24, 26, 1969. OWRR Project B-023-MO.

Descriptors: *Nitrates, *Fluorides, *Analytical techniques, Water analysis, *Electrodes, Ions, Water chemistry, Pollutant identification.
Identifiers: *Ion selective electrodes, Potentiometry, Standard Addition.

A standard addition analysis technique has been developed for nitrate where the fluoride ion-selective electrode is used as a reference electrode in solutions spiked with a low concentration of fluoride ion. The electrode system is more stable than the conventional system. Since a reference with liquid junction is not used, errors arising from liquid junction potential are eliminated. Dilution from the addition of standard affects both electrodes equally. Dilution corrections need not be made and a relatively large volume of standard may be added. Changes in ionic strength resulting from the addition of the standard affect the activity coefficients of both the fluoride and nitrate ions similarly and no errors are produced by the change in activity coefficients. Determinations of nitrate in the concentration range of 0.00005 M to 0.01 M have given reproducable results within plus or minus 1% and relative standard deviations of 0.5%. W70-08159

LOW TEMPERATURE PRECIPITATION TITRATION OF PERCHLORATE AND TETRAFLUOROBORATE WITH TETRAPHENYLARSONIUM CHLORIDE AND ION-SELECTIVE ELECTRODES,
Missouri Water Resources Research Center, Columbia.
Michael J. Smith, and Stanley E. Manahan.
Analytica Chimica Acta, Vol. 48, p 315-319, 1970. OWRR Project B-023-MO.

Descriptors: *Volumetric analysis, *Analytical techniques, Electrodes, Ions, *Chemical precipitation, Pollutant identification, Chemical analysis.
Identifiers: *Perchlorate, *Tetrafluoborate, Precipitation titrations.

Perchlorate and tetrafluoroborate have been determined at low concentrations by precipitation titration with tetraphenylarsonium chloride, the appropriate anion-selective electrodes being used to follow the course of the titration potentiometrically. A low temperature, 2 deg, was employed to sharpen the titration curves, thus resulting in greater accuracy and lower limits of analysis. As little as 0.05 mmol of perchlorate and 0.25 mmol of tetrafluoroborate have been determined to within 1% relative accuracy. These limits could easily be extended by a factor of 10 by using a miniaturized titration apparatus. (See also W70-08156) (Manahan-university of Missouri)

THE PRACTICE OF WATER POLLUTION BIOLOGY,
Federal Water Pollution Control Administration, Washington, D.C. Div. of Technical Support.
Kenneth M. Mackenthun.
Report for sale from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $1.50. Federal Water Pollution Control Administration Publication, Wash, DC, 1969. 281 p, 85 fig, 15 tab, 392 ref.

Descriptors: *Water pollution, *Investigations, *Water quality, *Water pollution effects, Bioindicators, Water pollution control, Pollutant identification, Surveys, Sampling, Data collections, Environmental effects, Ecology, Biological communities, Microbiology, Eutrophication, Water supply, Sewage treatment.
Identifiers: Water pollution biology.

This book presents some practical water pollution biological field investigative techniques and practices, procedures to solve problems, data analyses, interpretation and display, and the development and writing of the investigative report. It is written principally for the biologist inexperienced in these activities, and for sanitary engineers, chemists, attorneys, water pollution control administrators, and others. Aquatic environments, their biotic constituents, and the effects of various pollutants upon them are considered. Field investigations that include forming the study objectives, planning the field study, station selection, sample collection and examination, data analyses and interpretation, and reporting the results are described. Examples of field studies on specific water pollution problems are given with the collected data presented in many graphic variations. Examples of field investigations, including data collection, analyses, interpretation and display are given for organic wastes, silts, toxic wastes, acid mine drainages, eutrophication, and radioactive wastes. The biology of municipal water supplies and sewage treatment, biological nuisances, and slimes are discussed. (Knapp-USGS)

CLASSIFICATION OF ORGANIC POLLUTION IN SURFACE WATERS,
Research Inst. for Industrial Water Treatment, Prague (Czechoslovakia).
A. Brodsky, J. Prochazka, and H. Vydrova.
Journal of American Water Works Association, Vol 62, No 6, p 386-390, June 1970. 5 p, 12 fig, 13 ref.

Descriptors: *Organic matter, *Humus, *Sulfite liquors, *Analytical techniques, Chromatography, Chemical analysis, Water quality, Water analysis, Water pollution, Pollutant identification.
Identifiers: Oden's classification.

Oden's classification of humic substances in natural waters was compared with the elution patterns of these materials on Sephadex. The elution patterns of humic groups in the sense of Oden's systematics were shown using Sephadex G 75 grade. Basic peat extracts were prepared using different manners of preparation to duration of extraction period, buffer capacity and ion strengths of extraction agents. Isolation procedures, either precipitation or dissolving of precipitate followed by considerable changes in pH value or alcohol extractions influenced the proportions of fractions with smaller size particles. Drying of samples had a still more disturbing effect. It is possible to separate several fractions from humic substances using the G 75 grade without having any substantial portions of substances that were not displaced from the column. Under standardized conditions the elution curves may be used for qualitative--and, to a certain extent quantitative--estimation of individual groups of humic substance participation in the sample. PRELIMINARY ANALYSES OF THE WASTE WATER AND ASSIMILATION CAPACITIES OF THE ANACOSTIA TIDAL RIVER SYSTEM,
Federal Water Quality Administration, Annapolis, Md. Chesapeake Technical Support Lab.
Norbert A. Jaworski, Leo J. Clark, and Kenneth D. Feigner.
Federal Water Quality Administration, Chesapeake Technical Support Lab Report No 39, April 1970. 57 p, 16 fig, 4 tab, 5 ref, 3 append.

Descriptors: *Estuaries, *Water pollution effects, *District of Columbia, Tidal effects, Nutrients, Eutrophication, Water quality, Water pollution control, Surveys, Investigations, Path of pollutants, Sampling, Water analysis, Algae, Coliforms, Dissolved oxygen.
Identifiers: *Anacostia River.

A preliminary analysis of waste water assimilation and transport capacities was made of the tidal portion of the Anacostia River, Washington, D.C. The mean streamflow in the basin is about 122 cfs and the 7-day low flow with a recurrence interval of once-in-ten-years is 8 cfs. Based on 1969 sampling data, the water quality conditions in the tidal river under summer conditions are typified by: (a) Low dissolved oxygen concentrations often falling below 2.0 mg/l, (b) high fecal coliform densities often above 10,000 MPN/100 ml, (c) high turbidity levels especially during periods of high runoff, and (d) high nutrient concentrations. The most pronounced degradation results from storm sewer and combined sewer overflows and defective sanitary sewer systems. Mathematical model investigations of the Anacostia River indicate that waste water assimilation and transport capabilities for large advective flows are most sensitive to the decay rate of a pollutant and not to the dispersion effect of the tidal system. The sensitivity of the decay rate is a result of the long detention time, while the effect of dispersion is diminished by the pronounced advective movement. The tidal system capability to assimilate oxygen-demanding waste water is currently being exceeded. If waste water were subjected to high carbonaceous and nitrogenous BOD removal and if the effluent is aerated to 6.0 mg/l, the present water quality of the Anacostia River would be enhanced. (Knapp-USGS)

INCREASING THE RELIABILITY OF EXPERIMENTAL RESULTS ARRIVED AT IN STUDIES ESTABLISHING HYGIENIC STANDARDS FOR HARMFUL SUBSTANCES IN BODIES OF WATER,
S. N. Cherkinskiy, and G. N. Krasovskiy.
Available from the Clearinghouse as PB-185 824T, $3.00 in paper copy, $0.65 in microfiche. Translated from Russian. In: USSR Literature on Water Supply and Pollution Control, CFSTI, Vol 10, 1969, p 4-13.

Descriptors: *Water pollution, *Organic compounds, *Analytical techniques, *Pollutants, Methodology, Toxicity, Organic wastes, Organoleptic properties, Water pollution effects.

Common methodological errors in the analysis of harmful substances in water are discussed. The discussion includes: (1) Physical and chemical properties of pollutants; (2) stability of pollutants in water; (3) study of the organoleptic properties of water; (4) effects of pollutants on the overall sanitary regime of natural water bodies; and (5) sanitary toxicological investigations. Evaluation of pollutant data and interpretation of results are briefly mentioned. (Carstea-USGS)
W70-08285

EXPERIMENTAL BASIS FOR THE DETERMINATION OF MAXIMUM PERMISSIBLE ANILINE CONCENTRATION IN WATER BODIES,
A. I. Cooper, and V. P. Ozerova.
Available from the Clearinghouse as PB-185 824T, $3.00 in paper copy, $0.65 in microfiche. Translated from Russian. In: USSR Literature on Water Supply and Pollution Control, CFSTI, Vol 10, 1969, p 93-101.

Descriptors: *Water pollution, *Pollutants, *Analytical techniques, Methodology, Organoleptic properties, Organic compounds, Toxicity, Odor, Taste, Color, Biochemical oxygen demand.
Identifiers: *Aniline.

A chemically pure sample of aniline was used to determine its maximum permissible concentration and stability in water. Taste, odor and color of polluted water were changed by aniline. The threshold concentration for taste and odor was found to be 50-100 mg/liter, while that for color was 200 mg/liter. Aniline undergoes oxidation by biochemical processes and the biochemical oxygen demand is increased. The critical levels of biochemical oxygen demands can be avoided if the aniline concentration does not exceed 0.5 mg/liter. Based on the toxicological index, the maximum permissible aniline concentration in water was recommended as 0.1 mg/liter. (Carstea-USGS)
W70-08286

EXPERIMENTAL DETERMINATION OF MAXIMUM PERMISSIBLE POTASSIUM AND AMMONIUM THIOCYANATE CONCENTRATIONS IN BODIES OF WATER,
Ya. M. Kostovetskiy, K. F. Meleschenko, Z. I. Zholdskova, R. K. Rozhkovetskaya, and A. I. Lur'ye.
Available from the Clearinghouse as PB-185 824T, $3.00 in paper copy, $0.65 in microfiche. Translated from Russian. In: USSR Literature on Water Supply and Pollution Control, CFSTI, Vol 10, 1969, p 102-109.

Descriptors: *Water pollution, *Pollutants, *Analytical techniques, Methodology, Organoleptic properties, Organic compounds, Toxicity, Odor, Taste, Color, Biochemical oxygen demand.
Identifiers: Potassium thiocyanate, Ammonium thiocyanate, Hydrocarbon metabolism, Maximum permissible concentration.

Thiocyanate compounds have little effect upon water odor, color or transparency. The threshold of taste perception is 100 mg/liter. Biochemical oxygen demand showed an increase with increasing concentration of thiocyanates. Body weight, peroxydase activity of the blood, hydrocarbon metabolism and the morphology of the internal organs are not adversely affected by does of thiocyanates which varied between 0.5 and 0.0005 mg/kg. The maximum permissible concentration of thiocyanates in natural water is recommended at 0.1 mg/liter. (Carstea-USGS)
W70-08287

BASIC EXPERIMENTS FOR THE DETERMINATION OF MAXIMUM PERMISSIBLE NORSULFAZOLE CONCENTRATION IN WATER BODIES,
O. N. Yelizarova, A. I. Kuper, L. V. Zhidkova, A. A. Khutoryanskiy, and K. O. Lastochkina.
Available from the Clearinghouse as PB-185 824T, $3.00 in paper copy, $0.65 in microfiche. Translated from Russian. In: USSR Literature on Water Supply and Pollution Control, CFSTI, Vol. 10, 1969, p 129-136.

Descriptors: *Biochemical oxygen demand, *Dissolved oxygen, *Analytical techniques, Methodology, Pollutants, Organic compounds, Water pollution, Theoretical analysis, Chemical reactions, Chemical degradation.
Identifiers: Nomograms.

Biochemical oxygen demand and dissolved oxygen were used to determine the maximum permissible concentration of 11 organic pollutants in open water bodies. Determination of total biochemical oxygen demand is a complex and time-consuming procedure. Therefore, a first-order monomolecular-reaction equation in which the rate of the process is proportional to the concentration of residual unreacted material is used to determine the total biochemical oxygen demand. Nomograms were devised to compute the rate constant (k) for incubation periods of 2-5 and 3-5 days. (Carstea-USGS)
W70-08290

EXPERIMENTAL DETERMINATION OF THE MAXIMUM PERMISSIBLE CONCENTRATION OF PROPYLBENZENE IN WATER BODIES,
R. D. Smirnova, and I. M. Stepanova.
Available from the Clearinghouse as PB-185 824T, $3.00 in paper copy, $0.65 in microfiche. Translated from Russian. In: USSR Literature on Water Supply and Pollution Control, CFSTI, V. 10, 1969, p 122-128.

Descriptors: *Water pollution, *Pollutants, *Analytical techniques, Methodology, Organoleptic properties, Taste, Odor, Color, Toxicity, Biochemical oxygen demand.
Identifiers: *Propylbenzene.

The threshold concentration of propylbenzene with respect to odor perception is 0.2 mg/l. The self-purification processes of water containing up to 10 mg/l of propylbenzene were not affected. The effect of 0.2 mg/l of propylbenzene upon biochemical oxygen demand was slight. The toxicological threshold concentration of propylbenzene is 0.5 mg/l which is also the maximum permissible concentration. (Carstea-USGS)
W70-08291

RESIDUES IN FISH, WILDLIFE, AND ESTUARIES - CHLORINATED HYDROCARBON PESTICIDES IN CALIFORNIA BAYS AND ESTUARIES,
California State Dept. of Fish and Game, Menlo Park, Calif. Marine Resources Operations.
John C. Modin.
Pesticides Monitoring Journal, Vol. 3, No. 1, June 1969. p 1-7, 1 fig, 6 tab, 7 ref.

Descriptors: *Pesticide residues, *Monitoring, *DDT, *Dieldrin, Endrin, Pesticide drift, Chlorinated hydrocarbon pesticides, *Estuaries, Oysters, Clams, Bottom sediments, Chinook Salmon, Shellfish, Shrimp, Crabs, Gas chromatography, Fish eggs.
Identifiers: DDD, DDE, *Pesticide monitoring, Mussels, Halibut, Flounder, Seasonal variations, *California estuaries, Humboldt Bay, Morro Bay.

As part of a nationwide program to monitor organochlorine pesticide residues in estuaries, the U. S. Bureau of Commercial Fisheries in January 1966 contracted to the California Department of Fish and Game the responsibility to monitor selected estuaries in California for pesticides. Analyses of oysters, mussels, and clams sampled at points of interest within each estuary revealed DDT, DDD, DDE, dieldrin, and endrin in concentrations from 10 to 3,600 ppb. Calculations are based on the laboratory wet weight of homogenized tissue. In studies of offshore exposure, high levels of DDT, DDD, and DDE were found in a king crab (2,739 ppb) and in ova from a king salmon (668 ppb). Pesticides were also measured in the ova of prawn, flounder, halibut, and sole; of these, halibut ova were the most highly contaminated, with DDE, DDD, and DDT measuring 591 ppb. (Sjolseth-Washington)

DISTRIBUTION OF MERCURY IN WATER, BOTTOM MUD AND AQUATIC ORGANISMS OF MINAMATA BAY, THE RIVER AGANO AND OTHER WATER BODIES IN JAPAN,
Freshwater Fisheries Research Lab., Tokyo (Japan).
Yoshihiro Matida, and Hiroshi Kumada.
Bulletin of Freshwater Fisheries Research Laboratory, Contribution no. 253, Vol 19, No. 2, 1969. p. 73-93, 6 tab, 1 fig, 30 refs.

Descriptors: *Heavy metals, *Distribution, *Water analysis, Water chemistry, Water pollution effects, Water pollution sources, *Bottom sediments, *Aquatic animals, On-site investigations, Copper, Plankton, Aluminum, Manganese, Public health, Waste water disposal.
Identifiers: *Mercury, Japan, *Minamata Bay disease, Agano River, Thallium.

The distribution of mercury and other heavy metals in water, bottom mud, and aquatic organisms was determined for Minamata Bay and other water bodies in Japan. Among the heavy metals analyzed (Mercury, Manganese, copper, iron, titanium, thalliam, and aluminum) only mercury was very high in Minamata Bay and the Agano River where minamata disease had occurred. The distribution of mercury in Minamata Bay indicated that the origin of mercury was a plant which produced acetaldehyde from acetylene and water by the catalytic action of mercuric sulfate. The authors feel that since the content of total and organic mercury is high in aquatic organisms in many Japanese waters, that monitoring, background surveys, and studies on the accumulation mechanisms of heavy metals are desirable. (Sjolseth-Washington)

STUDIES ON THE METABOLISM OF PENTACHLOROPHENATE, A HERBICIDE, IN AQUATIC ORGANISMS -III. ISOLATION AND IDENTIFICATION OF A CONJUGATED PCP YIELDED BY A SHELL-FISH, TAPES PHILIPPINARUM (In Japanese),
Kyushu Univ., Fukuoka (Japan). Faculty of Agriculture; and Tokyo Univ. of Fishery (Japan).
Kunio Kobayashi, Akitake Hiroshi, and Tetuo Tomiyama.
Bulletin, Japanese Society of Scientific Fisheries, Vol. 36, No. 1, 1970, p 103-108, 11 refs, 5 figs, 3 tables.

Descriptors: Carbon radiosotopes, *Analytical techniques, Chromotography, Mode of action, *Isolation, Shell-fish.
Identifiers: *Pentachlorophenate, Carbon-14, *Tapes philippinarum, Detoxification, Biochemical change, *Biosynthesis, Identification, *Conjugated pentachlorophenate.

This paper deals with the isolation and identification of a conjugated 14C-labelled PCP-Na which is biosynthesized by the shell-fish. A PCP conjugate was isolated by treating a shell-fish culture medium with activated charcoal, followed by elution with ammonia-acetone, and finally by subjecting the eluate to silica-gel thin layer chromatography. The behaviors of the isolated conjugate in the chromatography and in the extractability with xylene were identical to those of synthesized PCP sulfate. An experimental result that the molar ratio of PCP to SO4 was about unity, evidences that the isolated PCP conjugate is a sulfate ester of PCP. It is to be concluded, therefore, that PCP can be largely detoxicated in the shell-fish by the conjugation with sulfate. (Sjolseth-Washington)

STUDIES ON THE METABOLISM OF PENTACHLOROPHENATE, A HERBICIDE, IN AQUATIC ORGANISMS -II. BIOCHEMICAL CHANGE OF PCP IN SEA WATER BY DETOXICATION, MECHANISM OF TAPES PHILIPPINARUM (In Japanese),
Kyushu Univ., Fukuoka (Japan). Faculty of Agriculture; and Tokyo Univ. of Fishery (Japan).
Kunio Kobayashi, Hiroshi Akitake, and Tetuo Tomiyama.
Bulletin, Japanese Society of Scientific Fisheries, Vol. 36, No. 1, 1970. p 96-102, 10 refs, 3 figs, 4 tab.

Descriptors: Carbon radioisotopes, *Biodegradation, *Analytical techniques, Shellfish, Herbicides, *Tracers, Mode of action, Distribution patterns, Sea water, Chemical properties.
Identifiers: *Pentachlorophenate, Carbon-14, *Tapes philippinarum, *Biochemical change, *Detoxification.

This paper deals with a study, using 14C-labelled PCP, on the biochemical change of PCP in the medium during the culture of Tapes philippinarum. It was elucidated that the decrease of PCP in the medium did not mean its decomposition, but its transformation some bound-form by the detoxication mechanism of the shell-fish. It was also confirmed that the excreta of shell-fish and micro-organisms in the medium played no role in the formation of the bound PCP. Although the bound PCP was not extracted with xylene from the acidified aqueous solution (0.02 N HCl) by the standard method for PCP determination, it was, however, determined as free PCP from the distillate of the steam-distillation of the acidified sample (0.6 N HCl). (Sjolseth-Washington)

LAKE MICHIGAN WATER QUALITY AS RELATED TO CHICAGO'S WATER TREATMENT PLANTS,
Department of Water and Sewers, Chicago, Ill.
James C. Vaughn.
A report presented at the FWPCA Four-State Conference on Pollution of Lake Michigan and Its Tributary Basin, Milwaukee, March 31, 1970. City of Chicago Department of Water and Sewers, March 31, 1970. 40 p, 16 fig, 11 tab.

Descriptors: *Lake Michigan, *Water quality, *Water works, *Water treatment, *Water supply, *Water quality control, *Lake morphology, *Water pollution, *Limnology, Water pollution effects, Pollution abatement, Lake basins, Odor, Chlorides, Sulfates, Phosphorus, Coliforms, Nitrogen, Plankton, Chemical analysis, Sampling, Monitoring.
Identifiers: *Chicago, Southern Lake Michigan, Conference on Pollution of Lake Michigan and Its Tributary Basin.

This report is the third presented at sessions of the Four-State Conference on Pollution of Lake Michigan and Its Tributary Basin. It describes the water quality of Lake Michigan and some of its tributaries, including the Indiana Harbor Ship Canal and the Calumet, Grand Calumet and Little Calumet rivers. The report focuses on the water quality of Lake Michigan in the vicinity of the South Water Filtration Plant, one of Chicago's two filtration plants. On the basis of continuing water sampling and analysis program involving studies of 24 quality parameters, the City reported that the water quality of Lake Michigan at the South Plant showed a marked improvement in 1969, except for Phosphorus, Nitrogen and Threshold Odor values. Bacteriological quality improved and plankton counts were lower, however, concentrations of inorganics increased. Costs of chemical treatments at the South Plant are tabulated. The report also includes comparisons of 1968 and 1969 water quality data for the west shore of Lake Michigan near the northern boundary of the City. A marked decline in quality, as measured by Phosphorus, Nitrogen, and Total Coliform, was evidenced. It is recommended that immediate and drastic action be taken to improve the quality of discharges to Lake Michigan along the North Shore. (Poertner)

SPECTROCHEMICAL DETERMINATION OF MICROGRAM QUANTITIES OF GERMANIUM IN NATURAL WATER CONTAINING HIGH CONCENTRATIONS OF HEAVY METALS,
Geological Survey, Sacramento, Calif.
Alex E. Dong.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970. Chapter B, US Geological Survey Professional Paper 700-B, p B242-B244, 1970. 3 p, 1 fig, 2 tab, 5 ref.

Descriptors: *Trace elements, *Water chemistry, *Groundwater, *Brines, *Spectroscopy, California, Analytical techniques, Chemical analysis.
Identifiers: Germanium.

A procedure is described for the chemical separation and determination of microgram quantities of germanium in water containing high concentrations of heavy metals. Before being subjected to spectrochemical determination, germanium is selectively isolated from other major and minor elements in the water in order to avoid undesirable dilution effects. The average error for eight determinations is plus or minus 9 percent, and the relative standard deviation is 8.0 percent, a level of precision satisfactory for spectrochemical determination of trace quantities of germanium. DETERMINATION OF TOTAL NITROGEN, PHOSPHORUS AND IRON IN FRESH WATER BY PHOTO-OXIDATION WITH ULTRAVIOLET RADIATION,
Norsk Institutt for Vannforskning, Oslo.
A. Henriksen.
Analyst, Vol 95, No 1131, p 601-608, June 1970. 8 p, 2 fig, 5 tab, 14 ref.

Descriptors: *Chemical analysis, *Nitrogen, *Phosphorus, *Iron, *Water analysis, Oxidation, Organic matter, Chemical reactions, Ultraviolet radiation, Light.
Identifiers: Photo-oxidation analysis.

A photo-oxidation method for determining total phosphorus and nitrogen in sea water was adapted for analysis of fresh-water samples and includes the determination of total iron. Samples are subjected to ultraviolet irradiation in a photochemical reactor consisting of a high pressure mercury-arc lamp, a reactor body with twenty-four fused silica sample tubes and a cooling fan. Organically combined phosphorus and iron are converted into orthophosphate and iron (III) ions in the presence of acid and excess of oxygen after an irradiation time of 1 hour. Organonitrogen compounds and ammonia in solutions with pH range 6.5 to 9 are oxidized to nitrate and nitrite after 4 hours' irradiation in the presence of excess of oxygen. (Knapp-USGS)

MERCURY CONTAMINATION IN THE NATURAL ENVIRONMENT,
Bureau of Commercial Fisheries, Ann Arbor, Mich.; and Dept. of Interior, Washington, D.C. Office of Library Services.
Ruth Rehfus, Arthur H. Priddy, and Mildred E. Barnes.
Available from the Clearinghouse for Federal Scientific and Technical Information, as PB-192 910, $3.00 in paper copy, $0.65 in microfiche. Department of Interior Office of Library Services Cooperative Bibliography, July 1970. 32 p, 209 ref, index.

Descriptors: *Bibliographies, *Water pollution, *Pollutants, *Heavy metals, *Poisons, Water pollution sources, Water pollution effects, Chemical wastes, Farm wastes, Environmental effects, Wildlife, Birds, Analytical techniques, Publications, Diseases, Toxicity, Water quality.
Identifiers: Mercury, Mercury pollution.

A bibliography was made of literature concerning mercury pollution. The purpose of this bibliography is to provide access to the literature for those beginning to work on the problem. English language material relating to fish, wildlife and water pollution was given full coverage. So much literature exists on other phases such as analysis, agricultural uses, industrial health, and clinical medicine, that it could not all be included. The criteria for selection in these areas were close relationship to environmental contamination, recommendations of scientists, or the presence of literature reviews or substantial bibliographies. (Knapp-USGS)

5B. Sources of Pollution

SPREADING AND MOVEMENT OF OIL SPILLS,
New York Univ., Bronx. Dept. of Chemical Engineering.
Henry G. Schwartzberg.
Available from the Clearinghouse as PB-192 852, $3.00 in paper copy, $0.65 in microfiche. Water Pollution Control Research Series, March 1970. 103 p, 9 tab, 21 fig, 82 ref. FWQA Program 150-80-EPL---4/70, Contract WP 01342-01A.

Descriptors: *Oily water, *Oil-water interfaces, *Drifting (Aquatic), *Waves (Water), *Winds, Oil wastes, Oil, Water pollution control, Wind velocity, Water pollution sources, *Path of pollutants.
Identifiers: *Oil spillage, Oil spill (Spreading rates), Oil lenses, Wind drift, Wave drift.

The spreading and movement of oil spills on water were investigated. Areas for spills which form lenses were measured and correlated. Most crudes tested formed thin films, not lenses; but lens formation could be induced and spreading greatly reduced by surfactant treatment. Spreading rates for small spills were measured and correlated with spill volume, oil density and water viscosity. Field data and energy conservation, however, indicates that these aspects of small spills cannot be scaled up to large spill volumes. Wind-water basin tests indicated that on quiet open water oil should drift windward at 3.66 plus or minus .17% of the wind velocity. The percentage drift was not significantly affected by oil or water properties, depth, and wind speed, and agrees fairly well with field data. Waves caused significant reductions in wind drift, but in the shallow basin used did not induce significant drift themselves. Since wind causes waves, and deep water waves cause drift, further investigation of wind and wave drift interaction is recommended. Wind drift was found to be confined to a thin surface layer. The use of 1 - 1 1/2 inch deep oil-confining drogues markedly reduced wind drift. Investigation of the use nets of such drogues and of lens formation to reduce oil spread and movement is recommended. In all cases combined wind and current drifts were found to be less than the current drift in the absense of winds.

A METHOD FOR PREDICTING POLLUTANT TRANSPORT IN TIDAL WATERS,
California Univ., Berkeley. Hydraulic Lab.
Hugo B. Fisher.

California Water Resources Center Contribution No. 132, March, 1970. 143 p, 9 tab, 14 fig, 21 ref. Project W-165.

Descriptors: Tidal waters, *Estuaries, Numerical models, Model studies, Path of pollutants, *Water pollution sources, Estuarine environment, Water pollution effects, *Forecasting, Computer programs, Dispersion.
Identifiers: *Tidal hydraulics, Tidal velocity, Tidal elevation, Pollutant transport, Pollutant dispersion, Estuarine geometry.

A numerical model is presented in two parts; part one models the tidal hydraulics of an estuary and determines tidal velocities and elevations; part two models the transport and dispersion of pollutants. The only input required to the model is the tidal fluctuation of water surface at the estuary mouth and the geometry and frictional characteristics of the estuary. The model may be used to predict pollutant distributions from discharges in existing estuaries, or to determine effects on pollution caused by changing the estuarine geometry. The model is entirely predictive, it models both the hydraulics and pollutant transport without requiring field measurement of artificial coefficients. The model is intended as a tool in pollution studies; it can be used to study in advance of construction the effect of dredging, dike-building, or channel realignment, or the effect on an existing estuary of a new source of pollutant. It is hoped that the model will be found useful in the continuing effort to improve our environment.

WATER QUALITY EFFECTS OF LEACHING FROM SUBMERGED SOILS,
National Field Investigations Center, Cincinnati, Ohio.
Lowell E. Keup, Gerald D. McKee, Edward W. Raabe, and Richard W. Warner.
Journal of American Water Works Association, Vol 62, No 6, p 391-396, June 1970. 6 p, 6 fig, 2 tab.

Descriptors: *Leaching, *Organic soils, *Water quality control, *Reservoirs, *Reservoir design, Humus, Organic matter, Iron, Manganese, Water quality, Water chemistry.
Identifiers: Cape Fear River (NC).

Impounding water may result in the leaching of undesirable materials from the inundated soils. The Northeast Cape Fear River to be impounded in Kornegay Reservoir contained high color values (100+units), high concentrations of lignin (13.6 mg/l), and concentrations of nitrogen and manganese that might interfere with water uses. This water could leach additional quantities of lignin, iron, manganese, and total phosphorus from the leaf litter covering the reservoir site. Experiments indicated that iron and manganese were leached at a greater rate under anaerobic conditions. With clear waters, (color, 18 units), substantial increases in materials leached were observed in either aerobic or anaerobic waters. The one exception was manganese which decreased substantially in the aerobic waters. It is recommended that organic-rich materials, especially leaf litter, be removed or plowed into the soil to prevent leaching of excessive iron, manganese, and lignin to the water. If practical, organic rich soils such as muck should be removed or buried. In addition, provisions should be made for multi-level water supply intakes. (Knapp-USGS)

CURRENT WATER QUALITY CONDITIONS AND INVESTIGATIONS IN THE UPPER POTOMAC RIVER TIDAL SYSTEM,
Federal Water Quality Administration, Annapolis, Md. Chesapeake Technical Support Lab.
Johan A. Aalto, Norbert A. Jaworski, and Donald W. Lear, Jr.
Federal Water Quality Administration, Chesapeake Technical Support Laboratory Technical Report No 41, May 1970. 38 p, 4 fig, 6 tab, 17 ref.

Descriptors: *Estuaries, *Water pollution effects, *District of Columbia, Tidal effects, Nutrients, Eutrophication, Water quality, Water pollution control, Surveys, Investigations, Path of pollutants, Sampling, Water analysis, Algae, Coliforms, Dissolved oxygen.
Identifiers: *Potomac River.

Based on data obtained by field investigations and from waste water treatment agencies in the Washington metropolitan area, a statement on current water conditions and investigations of the upper Potomac River tidal system was prepared and summarized. Fecal coliform densities are lower than in 1965 as a result of the increased chlorination of treated waste discharges since 1969. High fecal coliform densities were prevalent at times of high stream flow above the major wastewater discharges. These high densities can be attributed to a combination of land runoff from the upper Potomac basin, urban runoff, storm sewers and combined sewer overflows. Tributaries also contained very high fecal coliform densities at times. Extensive phytoplankton blooms were detected. Since the late 1930's the amount of phosphorus entering the Potomac has increased about tenfold and nitrogen increased about fivefold. The major shift toward nuisance blue-green algal growths appears to be related to increases in nitrogen and phosphorus, and not BOD (carbon). Most of the phosphorus which entered the tidal system from the upper basin, plus some from local waste water discharges, was adsorbed and deposited in the bottom sediments of the estuary. Dye and mathematical model investigations indicate that waste water assimilation and transport rates are very low. (Knapp-USGS)

A LAGRANGIAN METHOD FOR PREDICTING POLLUTANT DISPERSION IN BOLINAS LAGOON, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
Hugo B. Fischer.
U S Geological Survey Open-file report, December 31, 1969. 79 p, 12 fig, 1 tab, 13 ref, append.

Descriptors: *Dispersion, *Path of pollutants, *Bays, *Tidal effects, *California, Computer programs, Mathematical models, Water pollution control, Tides, Currents (Water), Tracers, Dye releases, Lagoons, Inlets (Waterways).
Identifiers: Bolinas Lagoon (Calif).

A numerical method and computer program are presented for use in predicting the movement and dispersion of a pollutant in a tidal embayment. The embayment geometry and the tidal cycle of water surface elevations at various interior points must be known. The computer program will generate the motion and dispersion of a concentrated slug of pollutant, or it will predict the concentration of pollutant at all points within the embayment resulting from a constant discharge at one point. The method was verified by predicting the dispersion of a slug of pollutant discharged near the mouth of Bolinas Lagoon, California. In field experiment, a slug of Rhodamine WT dye tracer dispersed in reasonable conformity to the numerical prediction. The numerical method was also used to predict the concentration distribution in Bolinas Lagoon resulting from a continuous addition of a pollutant at the location of the existing sewage outfall. A study was also made of the benefit resulting from detention of the pollutant during a two-hour period at low tide. In this case asignificant concentration reduction is observed in those portions of the lagoon which were previously the most seriously polluted. (Knapp-USGS)
W70-08254

EXPERIMENTAL DETERMINATION OF MAXIMUM PERMISSIBLE FERROCYANIDES (POTASSIUM FERROCYANIDE) CONCENTRATION IN NATURAL BODIES OF WATER,
R. D. Smirnova, S. M. Pavlenko, and Ye. M. Oleynik.
Translated from Russian: Available from the Clearinghouse in PB-185 824T, p 110-115, $3.00 in paper copy, $0.65 in microfiche. Included In: USSR Literature on Water Supply and Pollution Control, CFSTI, Vol 10, 1969, p 110-115.

Descriptors: *Water pollution, *Pollutants, *Analytical techniques, Methodology, Organoleptic properties, Organic compounds, Toxicity, Odor, Color, Taste, Biochemical oxygen demand.
Identifiers: *Ferrocyanide.

The maximum permissible potassium concentration ferrocyanide was established for potable water. Scattered and solar light, temperature of environment, reactions in the water and mixing factor were given special attention. The organoleptic threshold concentration of potassium ferrocyanide is 2.5 mg/l, the threshold concentration for the general sanitary regime is 25 mg/l, and the toxicological dose is 1.25 mg/l. Maximum permissible concentration for potassium ferrocyanide should be established on the basis of the sanitary-toxicological index. (Carstea-USGS)
W70-08288

SANITARY PROTECTION OF WATER BODIES AGAINST POLLUTION BY INDUSTRIAL WASTE WATERS: INDUSTRIAL POLLUTANTS OF WATER BODIES,
S. N. Cherkinskiy.
Translated from Russian. Available from the Clearinghouse in PB-185 824T, p 187-193, $3.00 in paper copy, $0.65 in microfiche. Included In: USSR Literature on Water Supply and Pollution Control, CFSTI, Vol. 10, 1969, p 187-193.

Descriptors: *Water pollution sources, *Pollutant identification, Water pollution, *Water pollution control, *Industrial wastes, Pollutants, Chemical wastes, Methodology, Analytical techniques, Water resources.

A collection of translations from USSR literature published under the title 'Industrial Pollutants of Water Bodies' contains 25 studies on the biological effects and hygienic significance of specific chemical industry pollutants. Several papers deal with scientific methodology and criteria used in experimental work for establishing maximum levels of harmful pollutants. This collection is addressed to public health physicians, hygienists, engineers, and technical personnel engaged in protecting water resources against pollution. (Carstea-USGS)

INVESTIGATIONS OF THE SUPPLY OF NUTRIENTS PROVIDED BY A PREDOMINANTLY AGRICULTURALLY UTILIZED WATERSHED WITH LAND SETTLEMENT (IN GERMAN),
H. Bernhardt, W. Such, and A. Wilhelms.
Munchner Beitrage zur Abwasser-, Fischerei- und Flussbiologie, 1969. Vol 16, p 59-118. 38 fig, 30 tab, 34 ref.

Descriptors: *Eutrophication, *Reservoirs, *Water pollution sources, Tributaries, Precipitation (Atmospheric), Runoff, Nitrogen, Phosphorus, Effluents, Domestic wastes, Agricultural watersheds, Farm wastes.
Identifiers: Wahnbach Reservoir (West Germany).

This voluminous report incorporates many previous findings of the senior author pertinent to the Wahnbach Reservoir, its hydrological and eutrophication features. In this paper primary attention is given to the two major factors of chemical pollution--nitrogen and phosphorus. The investigation disclosed that the larger part of nutrients, especially phosphorus, enriching the Wahnbach Reservoir, originates in agriculturally utilized areas, particularly numerous piles of animal manure. Only 40% of the annual quantity of phosphorus could be diverted from the reservoir by a combination of mechanical, biological, and chemical treatments. In the authors' opinion, the last statement is of decisive importance in planning the restoration measures for the area in question. (Wilde-Wisconsin)
W70-08356

THERMAL GRADIENTS IN RIVERS AND RESERVOIRS DUE TO HEATED PLANT EFFLUENTS,
Mississippi State Univ., State College. Water Resources Research Inst.
Adnan Shindala, and Melville S. Priest.
Available from the Clearinghouse as PB-193 022, $3.00 in paper copy, $0.65 in microfiche. Completion Report, June 1970. 20 p, 9 fig, 5 ref. OWRR Project A-037-MISS (1).

Descriptors: *Thermal pollution, *Heated effluents, Hydraulics, Rivers, Reservoirs, Thermal stratification, Estuaries, *Path of pollutants, Water pollution sources.
Identifiers: *Thermal gradients, *Calefaction, Cooling ponds.

The direction of heated effluents from large thermal power plants into stream and lakes has been a matter of public concern for some time, and the collection of prototype data related to the hydraulic aspects has taken on massive proportions. Unfortunately, most of the data are proprietary and not available for public analysis. The authors have endeavored to collect such data as are available to them for the initiation of steps toward generalization and the discussion of some of the more evident hydraulic considerations. The study is primarily concerned with rivers, including estuaries, with some interest in cooling ponds.

RADIONUCLIDE ACCUMULATION IN COLUMBIA RIVER BIOTA,
Oregon State Univ., Corvallis. Environmental Health Sciences Center
Donald R. Buhler
In: Water Studies in Oregon, Oregon State University, Water Resources Research Institute Fall Quarter 1969 Seminar WR012.69, Corvallis, p 41-54, January 1970. 14 p, 5 fig, 2 tab, 7 ref.

Descriptors: *Radioactive wastes, *Radioisotopes, *Columbia River, *Washington, *Nuclear powerplants, Path of pollutants, Water pollution effects, Fish, Safety, Toxicity, Public health, Standards, Waste disposal, Radioactive waste disposal.
Identifiers: Hanford (Wash).

The radionuclides released into the aquatic environment daily by the nuclear reactors at Hanford, Wash, were studied and found do not present a serious hazard to aquatic or terrestrial life living in or along the Columbia River. Maximum permissible levels of radioactivity released into the water are specified so that it is impossible for man to ingest sufficient quantities of fish or other radioactive species from the area to exceed permissible levels of radioactivity in the body. The absence of demonstrable hazardous effects on man or his environment during the 25 years of continuous safe release of radioactive wastes from the nuclear reactors at Hanford should provide some basis for an evaluation of the impact of a modern nuclear power plant which releases less than 0.02 percent as much radioactivity to the aquatic environment. (See also W70-08475). (Knapp-USGS)

WATERBORNE STYRENE IN A CRYSTALLINE BEDROCK AQUIFER IN THE GALES FERRY AREA, LEDYARD, SOUTHEASTERN CONNECTICUT,
Geological Survey, Hartford, Conn.
I. G. Grossman.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter B, US Geological Survey Professional Paper 700-B, p B203-B209. 7 p, 3 fig, 1 tab, 12 ref.

Descriptors: *Path of pollutants, *Groundwater movement, *Aquifers, *Connecticut, *Organic wastes, Joints (Geology), Fractures (Geology), Water pollution sources.
Identfers: *Styrene.

Styrene, a synthetic hydrocarbon which is only slightly soluble in water, was readily waterborne in the Gales Ferry area, Connecticut in 1961-64. Following shallow burial in 1960, styrene moved downward with vadose water through thin glacial till into the bedrock aquifer, which consists in large part of schist and quartzite and in small part of granite gneiss. Movement from two contaminating sources to cones of depression at six domestic wells was principally westward and northward along foliation joints and cross joints. Maximum overall movement exceeded 300 feet. Removal of the sources of contamination produced water of satisfactory chemical quality in 2 years or less. (Knapp-USGS)
W70-08489

DOSAGE REQUIREMENTS FOR SLUG INJECTIONS OF RHODAMINE BA AND WT DYES,
Geological Survey, Washington, D.C.
F. A. Kilpatrick.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter B, US Geological Survey Professional Paper 700-B, p B250-B253, 1970. 4 p, 3 fig, 2 ref.

Descriptors: *Tracers, *Dye releases, *Tracking techniques, Path of pollutants, Dispersion, Mixing, Streamflow, Discharge (Water), Stream gages.
Identifiers: Dye dosage.

Time-of-travel measurements, simulation studies of waste and thermal pollution, dispersion tests, and dilution type discharge measurements, in streams and estuaries, involve the slug injection of specific amounts of fluorescent dyes. Curves relating quantities of dye required for slug injections into streams are developed from data from nearly 500 field time-of-travel tests. Separate relationships are developed for Rhodamine BA and Rhodamine WT dyes. The application of the relationships is illustrated by an example.
W70-08498

THE MAGNITUDE AND EXTENT OF SALT-WATER CONTAMINATION IN THE CALOOSAHATCHEE RIVER BETWEEN LA BELLE AND OLGA, FLORIDA,
Geological Survey, Tallahassee, Fla.
Durward H. Boggess.
Florida Bureau of Geology Information Circular No 62, Part 2, p 17-39, 1970. 23 p, 8 fig, 2 tab, 3 ref.

Descriptors: *Saline water intrusion, *Canals, *Locks, *Streamflow, *Florida, Mixing, Density currents, Water pollution sources, Sea water, Chlorides, Path of pollutants.
Identifiers: Caloosahatchee River (Fla).

Repeated injections of salt water through the lock chamber at the W. P. Franklin Dam causes a progressive increase in the chloride content of water in the fresh water reach of the Caloosahatchee River during low-flow periods. Vertical profiles in the contaminated reach of the river show essentially the same chloride content of the water from the surface to a depth of about 12 feet and consistently higher concentrations at greater depths. The chloride content of the water in the deep and shallow zones decreases with increased distance upstream from the dam. In the deeper parts of the river channel, the upstream limit of water containing 250 mg/l of chlorides was 11.4 miles from the dam in May 1968. At shallow depths, the upstream limit of water containing 250 mg/l of chlorides was 5.3 miles from the dam in May 1967 and 4.7 miles from the dam in April 1968. (See also W70-08516). (Knapp-USGS)

5C. Effects of Pollution

SENSITIVITY OF BENTHIC MICROFLORA TO POLLUTION GRADIENTS,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
Nelson Marshall, Donald M. Skauen, and Candace A. Oviatt.
Available from the Clearinghouse as PB-192 853, $3.00 in paper copy, $0.65 in microfiche. Final Project Report (1970). 70 p, 9 ref. FWQA Project 18050DXU--6/70, Grant 1WP-01220.

Descriptors: Benthic flora, *Microorganisms, *Water pollution effects, Estuarine environment, *Productivity, Sedimentation, Environmental effects, Pollutants identification.
Identifiers: *Benthic microflora, Pollution gradients.

This program was initiated in June 1967 to evaluate relationships between the productive condition of the sediment environment and pollution effects normally experienced along a densely populated coastline. Specifically the work was designed to: (a) improve the methodology for measuring the productivity of the benthic microflora community; (b) determine the normal rate of productivity of the microflora community of shoal benthic environments, as indicated by the rate of 14C uptake by intact samples of samples; and (c) compare this norm with productivity in an area affected by heavy domestic pollution and an area affected by thermal addition. (Limited results were obtained for this objective.) Data are presented on the reliability

nd variability of calculations of primary produc-
vity.

'LANKTON COMMUNITY AND HYDRAULIC 'HARACTERIZATION PRELIMINARY TO .AKE FLUSHING,
Vashington Univ., Seattle. Dept. of Civil Engineer-
ng.
ugene B. Welch, Ronald J. Buchanan, Ronald E.
lece, and Richard H. Bogan.
Available from the Clearinghouse as PB-192 760, 3.00 in paper copy, $0.65 in microfiche. Final re-
ort, October, 1969. 181 p, 11 tab, 32 fig, 14 ref, 3
ppend. FWQA Project 16010--10/9.

Descriptors: Eutrophication, *Plankton, Lakes, tanding crop, *Nutrients, Water quality, Water ollution effects, *Hydraulic models, Mathemati-al models, Water pollution control, Washington.
dentifiers: *Moses Lake (Washington), *Lake lushing, Flushing, Low-nutrient water.

The effect was evaluated of adding varying mounts of low-nutrient flushing water to one area f Moses Lake, a 6,500-acre highly eutrophic lake n eastern Washington. Cluster analysis of plankton lata identified 6 sample groups and species groups. Temporal and spatial variations in community ypes and standing crops appear to be related to de-ention time, nitrate content, and available light. The effect of low-nutrient dilution water on lake lankton growth response indicated growth at 90% nd 86% lake water. General agreement was ob-ained among 3 field techniques for determining ime of travel through a section of upper Parker Horn. Dye studies, diurnal plankton sampling, and ield observations indicate that southerly winds ave a great effect on moving algae upstream into pper Parker Horn. Water movements in the lake ould be simulated in a distorted Froude law ydraulic model. Removal of algae and nutrients by lushing procedures in Parker Horn and the lower ake would likely be more effective at night. Moses Lake behaves both biologically and hydraulically as though it were divided into several partially iso-ated regions. A tentative mathematical model has been set up for simulating the productivity and dis-tribution of algae. Flushing Parker Horn with large slugs of low nutrient water may not be effective because of wind action transporting algae and their entrained nutrients back into the Horn together with nutrient regeneration from sediments.

WATER QUALITY BEHAVIOR IN RESERVOIRS,
Consumer Protection and Environmental Health Service, Cincinnati, Ohio.
James M. Symons.
For sale by Superintendent of Documents, US Government Printing Office, Wash, DC 20402 - Price $3.25. US Public Health Service Publication No 1930 (Compilation of Research Papers), Department of Health, Education, and Welfare, Cincinnati, Ohio, 1969. 616 p. Published by US Government Printing Office, Wash, DC.

Descriptors: *Water quality, *Reservoirs, *Eutrophication, *Limnology, Dissolved oxygen, Oxygen demand, Aeration, Mixing, Water pollution, Biological properties, Nutrients, Research and development, Organic wastes, Stratification.
Identifiers: Water storage effects.

The technical papers prepared from data collected for the project 'Influence of Impoundments and Controlled Releases on Water Quality.' from September 1962 through December 1966 are compiled. Research on this project was divided into two broad categories: (1) investigative research, designed to better understand reservoir water quality behavior; and (2) engineering research, designed to develop engineering methods for the control of reservoir water quality. Papers included in this Compilation cover a review of the literature on the project topic and a statement of research needs, and research on the dissolved oxygen budget in reservoirs, on the behavior of the nitrogen cycle in reservoirs, on the behavior of synthetic organics in stratified reservoirs, and on the use of artificial destratification as an engineering technique for managing and maintaining good quality water in reservoirs. A bibliography was compiled of papers relating to artificial destratification. (Knapp-USGS)

DEPENDENCE OF THE EMBRYONIC DEVELOPMENT AND VIABILITY OF THE CARP ON THE TRACE ELEMENT ZINC,
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
V. I. Vladimirov.
Voprosy Ikhtiologii (Problems of Ichthyology) Vol 9, No 5, 1969, p 687-696. 27 ref. 3 fig, 4 tab.

Descriptors: Water pollution effects, *Carp, *Embryonic growth stage, *Viability, Heavy metals, Fish eggs, Fish physiology, Larval growth stage, Toxicity, Trace elements, Laboratory tests, Fertility.
Identifiers: Zinc, Embryonic development, *Zinc sulfate, Survival.

Zinc concentrated in very large amounts by carp eggs in the course of oogenesis has an adverse effect on embryonic development and on the viability of the larvae. The addition of zinc sulfate in amounts of 0.05 mg/liter in the early stages of embryogenesis improved the development and viability of the larvae on average. The same effect was also noted when larvae were exposed to the stated doses in the first 10-15 days after hatching, but the positive effect was weaker in this case. The reactions of embryos and larvae to the addition of zinc are largely dependent on zinc content in the eggs. (Sjolseth-Washington)
W70-08360

HEAT TOLERANCE OF CHANNEL CATFISH, ICTALURUS PUNCTATUS,
Arkansas Univ., Fayetteville. Dept. of Zoology.
Kenneth O. Allen, and Kirk Strawn.
Proceedings, 21st Annual Conference of the Southeastern Association of Game and Fish Commissioners, 1967, p 399-411. 4 figs, 2 tab. 15 refs.

Descriptors: Catfishes, Channel catfish, Acclimatization, *Heat resistance, Heated water, Thermal pollution, Thermal stress, Resistance, Lethal limit, Water pollution effects, Mortality, Fishkill, Fish physiology, Effects.
Identifiers: *Ictalurus punctatus, *Thermal tolerance, Survival, *Lethal effects.

Three lots of channel catfish, comprising tow size and age groups were tested for several factors affecting heat tolerance. Heat tolerance was apparently determined by genetic background, acclimation level, and to a lesser extent by age. Thermal history prior to acclimation and size did not appear to influence heat tolerance. The fingerling fish had the highest upper-lethal temperatures. However, at 'quickly lethal' temperatures older fish ahd greater resistance. The upper lethal temperatures for 44-57-day-old fish were approximately 36.6, 37.3, and 37.8 for 26.0, 30.0, and 34.0 acclimations. There appeared to be at least six lethal effects that tended to separate the fish into physiological populations on the basis of their heat resistance. Heat death may occur up to 13-3/4 days after initial exposure. High temperatures may indirectly cause mortalities over a still longer period of time by increasing the rate of metabolism beyond the fishes ability to consume food. (Sjolseth-Washington)

FIELD TRIALS OF ANTIMYCIN AS A SELECTIVE TOXICANT IN CHANNEL CATFISH PONDS,
Bureau of Sport Fisheries and Wildlife, Warm Springs, Ga. Southeastern Fish Control Lab.
Ralph M. Burress, and Charles Luhning.
Investigations in Fish Control, No. 25, 1969. 11 p, 8 tab, 4 ref.

Descriptors: *Antimycin A, *Channel catfish, Fish control agents, Fish farming, Fish harvest, Fish management, Sunfishes, Shiners, Cost-benefit analysis, Commercial fish, Degradation, Fishkill, *Evaluation, Pesticides.
Identifiers: *Antimycin, Scalefishes, *Selective toxicant.

Antimycin effectively and economically controlled heavy infestations of green sunfish and golden shiners from channel catfish ponds at a Mississippi fish farm. An initial application of 5 p.p.b. of antimycin in two ponds and 7.5 p.p.b. in the third pond eliminated nearly 99 percent of the scalefishes. A followup treatment of 10 p.p.b., 4 days later, further reduced these populations with no apparent effect on yearling catfish. At harvest, three untreated ponds produced 1,474 pounds of scalefishes or an average of 389 pounds per acre, yielded 27.4 percent or 1,155 fewer catfish than the three treated ponds, and contained 1,183 undersize fish or nearly three times as many that were too small for table use. Treated ponds produced an additional 1,015 pounds of fish worth $507.50, while antimycin cost only $145.79. (See also W70-08365) (Sjolseth-Washington)
W70-08364

LABORATORY STUDIES ON ANTIMYCIN A AS A FISH TOXICANT,
Bureau of Sport Fisheries and Wildlife, LaCrosse, Wis. Fish Control Lab.
Bernard L. Berger, Robert E. Lennon, and James W. Hogan.
Investigation in Fish Control, No. 26, 1969. 20 p, 17 tab, 1 fig, 17 ref.

Descriptors: *Antimycin A, *Bioassay, Water temperature, Hydrogen ion concentration, Laboratory tests, Fish control agents, Fish management, Fish kill, *Toxicity, Mortality, *Freshwater fish, Channel catfish, Rainbow trout, Resistance, *Piscicides, Turbidity, Lethal limit.
Identifiers: *Water quality effects, Fish toxicant, *Selective toxicant, Sensitivity, Detoxification.

Liquid and sand formulations of antimycin A were tested in laboratory waters of various temperature, hardness, pH, and turbidity against 31 species of freshwater fish of various sizes and life stages. Each formulation of toxicant was lethal under all water conditions to fish eggs, fry, fingerlings, and adult fish. Trouts are the most sensitive and catfishes the least sensitive. Of the 31 species, 24 succumb to 5 p.p.b. or less of the toxicant; only certain catfishes survive 25 p.p.b. The order of toxicity to various species of fish suggests that antimycin has possibilities for selective or partial control of certain un-

wanted fish. Antimycin is more active in warm water than in cold. It is slightly more active in soft water than in hard; it is more active and persists far longer in water at pH 5 to 8 than at/pH 9 or 10. The results contributed to registration of antimycin A in Fintrol-5 formulation as a fish toxicant. (See also W70-08366) (Sjolseth-Washington)
W70-08365

FIELD TRIALS OF ANTIMYCIN A AS A FISH TOXICANT,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
Philip A. Gilderhus, Bernard L. Berger, and Robert E. Lennon.
Investigations in Fish Control, No. 27, 1969. 20 p, 18 ref, 16 tab.

Descriptors: *Antimycin A, *Piscicides, *On-site tests, Degradation, Fish control agents, Hydrogen ion concentration, Resistance, Water temperature, *Fish management, Fishkill, Evaluation, Toxicity.
Identifiers: Water quality effects, *Fish toxicant, Detoxification, *Selective toxicant.

Antimycin A was subjected to field trials as a fish toxicant in 20 ponds and lakes and 5 streams in the East, Midwest, and West of the United States. Ten parts per billion or less of the toxicant were effective against most of the 54 species of fish we encountered, including carp, suckers, and green sunfish. Differences in sensitivity among fish suggest possible use of antimycin as a selective toxicant. The efficacy of the toxicant is influenced by pH and water temperature, with slightly higher concentrations necessary at high pH or in cold water. Antimycin does not repel fish, and its toxic action on fish appears to be irreversible. It degrades rapidly, usually within a week. Fishkilling concentrations have little or no effect on other aquatic animals. (See also W70-08367). (Sjolseth-Washington)
W70-08366

USE OF ANTIMYCIN FOR SELECTIVE THINNING OF SUNFISH POPULATIONS IN PONDS,
Bureau of Sport Fisheries and Wildlife, Warm Springs, Ga. Southeastern Fish Control Lab.
Ralph M. Burress, and Charles W. Luhning.
Investigations in Fish Control, No 28, 1969. 9 p, 3 tab, 5 ref.

Descriptors: *Antimycin A, *Piscicides, *Sunfishes, Georgia, *Fish control agents, Cost analysis, Fish management, Fish kill, Toxicity, Fish conservation, Water temperature, Fish populations, On-site tests.
Identifiers: *Antimycin, Fish toxicant, Selective toxicant, Selective thinning, Effective concentration, Bluegills.

Selective removal of bluegills, redear sunfish, and redbreast sunfish was accomplished in six soft-water ponds in west central Georgia by applications of 0.4, 0.6, 0.8, and 1.0 parts per billion (p.p.b.) of antimycin in the Fintrol-5 formulation. Successful treatments were made during winter, spring, and late summer at water temperatures raning from 46 deg to 75 deg F. and under a wide variety of weather conditions. The 0.4-p.p.b. treatment made at 75 deg F. removed 2.9 pounds per acre of largemouth bass less than 6 inches long and 69 pounds per acre of all sizes of sunfishes. The 0.6 p.p.b. applied at 47 deg F. reduced the numbers of bluegills less than 4 inches in length by about half with very little effect on largemouth bass or larger bluegills. Bass, bluegills, and redear sunfish which survived multiple exposures to antimycin in concentrations up to 1.0 p.p.b. were able to reproduce normally. (See also W70-08364) (Sjolseth-Washington)
W70-08367

THE SUCCESSION OF THE BOTTOM FAUNA COMMUNITIES IN POLLUTED ESTUARINE HABITATS, (PRELIMINARY REPORT),
Institute of Marine Research, Helsinki (Finland) Biology Div.
Pauli Bagge.
Limnologica, Vol. 7, No. 1, 1969, p. 87-94. 2 tab, 5 fig, 7 ref.

Descriptors: *Succession, *Benthic fauna, *Biological communities, *Water pollution effects, Estuarine environment, Salinity, Dissolved oxygen, Oligochaetes, Environmental effects, Distribution patterns, Dominant organisms, Climatic climax.
Identifiers: Sweden, *Polluted estuaries, Baltic-Skagerak region, *Salinity zones chironomids, Capitellids, Spionids, Secondary succession, *Climax communities.

The benethic faunae of five polluted estuaries situated in the Baltic-Skagerak region have been compared. The localities represent a gradation from oligohaline to mixoeuhline conditions. In all of the salinity zones compared, wherever the oxygen content of the bottom water is low limivorous or selective deposit feeding species predominate in the type species groups. In the oligohaline and /3-mesohaline zones such species are mainly oligochaetes and chironomids, while in a more saline environment these are replaced by capitellids and spionids. The secondary succession of the benthic animal communities caused by pollution was shown to be a rapid process, especially in localities where the exchange of water is limited. (Sjolseth-Washington)

THE EFFECTS OF SULFIDE PULP WASTES ON THE GROWTH OF MARINE PHYTOPLANKTON,
Kagawa Univ., Takamatsu (Japan). Faculty of Agriculture.
Tomotoshi Okaichi, and Akitaka Yaguy.
Bulletin of Plankton Society of Japan, Vol 16, No. 2, p 126-132, Dec. 1969. 2 tab, 3 fig, 7 ref.

Descriptors: *Pulp wastes, Water pollution effects, *Growth rates, Chemical oxygen demand, Chemical wastes, Waste identification, Sulfite liquors, Chemical analysis, Phytoplankton, Chlorella, Lignins, Nutrient requirements.
Identifiers: *Enterptiella, Cyclotella, Lignosulfonic acid, *Prorocentrum triestinum, *Sulfide pulp liquors.

The authors described the culture of marine phytoplankton with sulfide pulp wastes diluted with either sea water or artificial media. They found that sulfide pulp wastes diluted 250 to 500 times were effective in promoting the growth of Euterptiella sp. and Prorocentrum triestinum. The pulp wastes were fractionated with ion exchange resins in order to obtain the active substances. (Sjolseth-Washington)

GLENODININE, AN ICHTHYOTOXIC SUBSTANCE PRODUCED BY A DINOFLAGELLATE, PERIDINIUM POLONICUM (In Japanese),
Tokyo Univ. (Japan). Lab. of Marine Biochemistry.
Yoshiro Hashimoto, Tomotoshi Okaichi, Le Dung Dang, and Tamao Noguchi.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 34, No. 6, 1968. p. 528-534, 7 figs, 1 tab, 8 refs.

Descriptors: Water pollution sources, Water pollution effects, Dinoflagellates, Fishkill, Fish toxins, Bioassay, Aquatic algae, *Algal toxins, Killifishes, *Toxicity, Isolation.
Identifiers: Lake Sagami, Japan, *Glenodinine, *Peridinium polonicum, Plankton blooms.

In September 1962, extensive water blooms of a dinoflagellate identified as Peridinium polonicum, accompanied by mass mortality of fish, occurred in Lake Sagami near Tokyo. An attempt was made to isolate the suspected ichthyotoxic substance from the plankton collected from the lake. The substance was confirmed to be an alkaloid and to contain a sulfhydryl radical. The authors designated it as glenodinine. Bioassays showed glenodinine to be extremely toxic to both freshwater and marine fishes. (Sjolseth-Washington)
W70-08372

FISH POPULATIONS AND AQUATIC CONDITIONS IN POLLUTED WATERS IN LOUISIANA,
Louisiana Wild Life and Fisheries Commission.
James T. Davis.
Louisiana Wild Life and Fisheries Commission (Fisheries Section), (Bulletin 1-1960) 1960, 121 p, 68 tab, 21 figs. Dingell-Johnson Project F-4-R.

Descriptors: Fish populations, Aquatic environment, *Water pollution effects, Pulp wastes, Louisiana, *On-site investigations, *Water analysis, Water chemistry, Water quality, Domestic wastes, Fish food organisms, *Benthos, Fish reproduction, Fish migration, Comparative productivity, Bioassay, Taste, On-site data collections.
Identifiers: Ouachita River, Louisiana.

The Ouachita River in Louisiana was studied for fish populations and aquatic conditions in its polluted waters to devise a system of surveying polluted areas so that data needed to establish a workable effluent discharge compatable with fish management could be maintained. Fish populations, benthic organisms, fish stomach samples, reproduction, bioassays of selected effluents, and flesh taste tests were examined and evaluated to determine the effects of pollution on fish. (Sjolseth-Washington)

Descriptors: *Chlorinated hydrocarbon pesticides, *Pesticide toxicity, *Pesticide residues, Pesticide kinetics, Pesticide drift, Pesticide removal, Water pollution effects, Monitoring, Aquatic environment, Animal physiology, Animal behavior, Enzymes, Mortality, DDT, Ecosystems.
Identifiers: *Pesticide effects, *Research needs, Residue monitoring, Hormones.

Highest concentrations generally occur in carnivorous species. Thus predatory and fish-eating birds ordinarily have higher residues than do herbivores. Any segment of the ecosystem receives various amounts and kinds of pesticides at irregular intervals. The different animals absorb, detoxify, store, and excrete pesticides at different rates. Different degrees of magnification of pesticide residues by living organisms in an environment are the practical result of many interactions that are far more complex than implied by the statement of magnification up the food chain. Direct mortality of wild animals as an aftermath of recommended pesticide treatments has been recorded in the literature of numerous countries. The impact of these new components of the environment has appeared as death, reproductive impairment, disruption of species balance, and behavioral alteration, but the overall effects on the environment have not been determined. Research should be aimed at interpretation of the significance of pesticide residues to survival and reproduction, to assessment of levels of pesticides in critical environments, and to the kinetics of pesticides in in-

viduals and the ecosystem. (Sjolseth-Washing-n)

ulletin of the Japanese Society of Scientific Fishe-es, Vol 35, No. 12, 1969, p 1179-1183, 3 figs, 1 b, 8 refs.

escriptors: Carbon radioisotopes, Shellfish, Her-cides, *Absorption, Degradation, *Toxicity, ode of action, Tracers, *Animal metabolism, nalytical techniques, Distribution, Distribution atterns, Biodegradation.
entifiers: *Pentachlorophenate, *Tapes philip-narium, Bojanus organ, Liver, *Tissue analyses, istribution rate, Carbon-14.

regards to the toxicity of PCP to a shell-fish, apes philippinarum, it has previously been re-orted that the PCP levels higher than 0.1 ppm was thal. The paper deals with the turnover of ab-orbed PCP in the shell-fish using C-labelled PCP. CP dissolved in the media was rapidly absorbed y the shell-fish and distributed into the various tis-ues, especially the Bojanus' organ and the liver, nd then quickly eliminated, presumably from the ojanus' organ. It was also revealed that most of ie accumulated PCP in the tissues were undecom-osed and were either free or in the bound form. Sjolseth-Washington)

THE TOXIC EFFECT OF PEN-TACHLOROPHENATE, A HERBICIDE, ON FISHERY ORGANISMS IN COASTAL WATERS V. (In Japanese),
Kyushu Univ., Fukuoka (Japan). Faculty of Agriculture; and Tokyo Univ. of Fishery (Japan).
Junio Kobayashi, Takeaki Kurokawa, and Tetuo Tomiyama.
Bulletin, Japanese Society of Scientific Fisheries Vol. 35, No. 2, 1969, p 206-210. 7 figs, 8 refs.

Descriptors: Shellfish, Herbicides, *Bioassay, Tox-city, *Salinity, *Resistance, Effects, *Mortality, Seasonal.
Identifiers: *Pentachlorophenate, *Tapes philip-pinarum, *Low salinity sea water, Seasonal varia-tion.

This paper deals with the relationship between the toxic effects of PCP and/or the diluted sea water on the shell-fish. The toxic threshold of the diluted sea water to the shell-fish was in the vicinity of 7% in the chlorinity at 25 deg C. In the higher chlorinity than 7% the toxicity of PCP increased according to the increase in concentration more than 0.1 ppm. In the lower chlorinity than 7%, however, the tox-icity of PCP, even at 0.3 ppm level, was obscured under the arising toxicity of the lower salinity. The preculture in a diluted sea water of 5% chlorinity did not promote the toxicity of PCP, at 0.2 and 0.3 ppm level, to the shell-fish. The resistance of the shell-fish to a low salinity sea water or PCP changed seasonally during the experiments from July 24th to Oct 9th. Therefore, the experiment on the toxic effect of PCP to the shell-fish must be done at the same time when the shell-fish is damaged by PCP used in the fields. (Sjolseth-Washington)

TOXICITY OF YELLOW PHOSPHORUS TO HERRING (CLUPEA HARENGUS), ATLANTIC SALMON (SALMO SALAR), LOBSTER (HOMARUS AMERICANUS), AND BEACH FLEA (GAMMARUS OCEANICUS),
Fisheries Research Board of Canada, St. Andrews (New Brunswick).
V. Zitko, D. E. Aiken, S. N. Tibbo, K. W. T. Besch, and J. M. Anderson.
Journal of the Fisheries Research Board of Canada, Vol 27, p 21-29, 1970. 3 fig, 2 tab, 6 ref.

Descriptors: *Phosphorus, Atlantic salmon, Her-rings, Lobsters, *Bioassay, *Lethal limit, *Toxicity, Fishkill, Fish physiology, Oxidation, Animal physiology, Water pollution effects.
Identifiers: *Yellow phosphorus, Beach flea, Gam-marus Oceanicus, Hemolysis.

Yellow phosphorus is extremely toxic to aquatic life. In herring, salmon, and lobster, the toxic effect of phosphorus is irreversible and probably cumula-tive. For herring LT50 (hours) = 300/C0.87, where C = /u g/liter of phosphorus. No clear indications of an incipient lethal level were found, an LT50 being obtained even at a concentration of 2.5 /ug/liter. Incipient lethal levels of yellow phosphorus for lobster, salmon, and beach flea are 40 ug/liter, 18 ug/liter, and 304 mg/liter, respectively. Poisoned fish turn red and show signs of extensive hemolysis. Blood of lobster congeals, and after death the thorax may be filled with thick gel and the heart grossly distended. For lobster, LT50 (hours) = 300-0.17x, where x = product of phosphorus con-centration and exposure time (ug days/liter). The oxidation of dispersions of yellow phosphorus in water is kinetically a first-order reaction with hald-life of 2-7.5 hr. The absorption of yellow phosphorus on a solid support such as bottom mud substantially decreases the rate of oxidation. (Sjol-seth-Washington)

EFFICACY OF QUINALDINE AS AN ANESTHETIC FOR SEVEN SPECIES OF FISH,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
Richard A. Schoettger, and Arnold M. Julin.
Investigations in Fish Control, No. 22, 1969, 9 p, 4 tab, 18 ref.

Descriptors: *Evaluation, Rainbow trout, Brown trout, Brook trout, Channel catfish, Bass, *Equilibrium, *Fish behavior, Fish physiology, Fish management, Toxicity, Water chemistry, Hydrogen ion concentration, Fish eggs, Laboratory tests.
Identifiers: *Quinaldine, *Anesthetic, Bluegill, Drug, Narcosis, *Efficacy.

Quinaldine was tested as an anesthetic for rainbow trout, brown trout, brook trout, lake trout, channel catfish, bluegill, and largemouth bass. In general 15 to 70 ppm of the drug induces total loss of equilibri-um in fish within two minutes. Efficacy is in-fluenced by acid pH and for some species, by tem-perature, but not by water hardness, age of quinal-dine solutions, or repeated exposures of fish to quinaldine. Assets include rapid action and pro-longed maintenance of anesthesia, but anethetized fish retain a degree of reflex responsiveness which may interfere with stripping, delicate surgical operations, and blood collection. The drug is harm-less to fertilized rainbow trout eggs at concentra-tions and exposure time normally encountered in spawning operations. (See also W70-08382). (Sjol-seth-Washington)
W70-08381

QUINALDINE AS AN ANESTHETIC FOR BROOK TROUT, LAKE TROUT, AND ATLAN-TIC SALMON,
Maine Dept. of Inland Fisheries and Game, Au-gusta.
David O. Locke.
Investigations in Fish Control, No. 24, 1969. 4 p, 1 fig, 6 refs.

Descriptors: Atlantic salmon, Brook trout, Lake trout, *Evaluation, *Resistance, Fish behavior, Fish management, Laboratory tests, Cost com-parisons, Fish physiology.
Identifiers: *Quinaldine, *Anesthetic, *Sensitivity, *Recovery, MS-222, Water temperature effects.

Quinaldine (2-methylquinoline) was an effective anesthetic for yearling Atlantic and landlocked sal-mon and book and lake trout in waters ranging from 10 to 40 ppm total hardness and temperatures ranging from 36 deg to 40 deg F. and from 47 deg to 59 deg F. Lake trout were more sensitive than the other species tested. In tests, anesthetization and recovery rates for five concentrations (5, 10, 15, 20 and 25 ppm) at both temperatures (10 ppm) was generally satisfactory for lake trout. A concen-tration of 15 ppm was satisfactory for marking and general handling of salmon and brook trout. Quin-aldine is one twenty-fourth as expensive as MS-222 at 1:12,000, and in view of the results the author feels this drug warrants wider use as a fish anesthetic. (See also W70-08381). (Sjolseth-Washington)

RELATIONSHIP BETWEEN SEA WATER AND BOTTOM CONDITION AND MECHANISM OF FISHERIES PRODUCTION IN ESTUARINE AREAS (In Japanese). WITH SPECIAL REFERENCE TO THE DETERIORATION OF PEARL OYSTER FARM,
Mie Prefectural Univ., Tsu (Japan). Faculty of Fisheries.
Fukuzo Uyeno.
Bulletin Japanese Society of Fisheries Oceanog-raphy, Special Number (Prof. Uda's Commemora-tive Papers), 1969. p. 193-196. 1 fig, 22 refs.

Descriptors: *Bottom sediments, Estuarine environment, Commercial shellfish, Oysters, *Deterioration, *Aquaculture, *Cycling nutrients, Hydrogen sulfide, Water quality, Water quality control, Stagnant water.
Identifiers: *Pearl oysters, *Environmental deterioration, Over-culture.

This paper deals with the deterioration of pearl oyster farms by over-culture, from a viewpoint of circulation of nutrient substances in the farm water in a rather closed area. The deterioration is environmentally observed as appearances of low oxygen water, hydrogen sulfide poisoning, anaerobic bottom mud, etc. These happen quite suddenly in July and September by the stagnation of water after a long rain and a neap tide. At this time many organic substances and inorganic nutrient salts are supplied to the water from superficial bottom mud and this consumes oxygen. Originally the organic substances are pearl oyster faeces and dead phytoplankton. Therefore, water exchange near the bottom is an important problem. It is becoming clear that there are some qualitative differences for the growth of pearl oysters among the estuarine environments, such as chlorophyll content of water, phaeophytin content of superficial bottom mud and so on. Methods to artificially recover such deteriorated farms were tried from various view points, especially by accelerating the bottom water exchange. (Sjolseth-Washington)

TYPICAL FISH MORTALITY RATES IN EASTERN LAKE ERIE,
State Univ. Coll., Fredonia, N.Y.
Linda A. Tomkiewicz.
Lake Erie Environmental Studies, Technical Data Report, Number 4, April 1970, 15 p, 5 fig, 9 ref.

Descriptors: *Lake Erie, *Fishkill, Mortality, Smelts, Bass, Bullheads, Great Lakes, On-site data collections, *Water pollution effects, Water pollution sources, Fish diets, Carp, Commercial fishing, Sport fishing, Fish populations, Yellow perch.
Identifiers: *Seasonal mortality variations, Alewife.

This study was conducted to establish a base line of natural fish mortalities in eastern Lake Erie throughout a yearly cycle. Seasonal variations in mortality rate indices are shown graphically for the eight most common species (smelt, black bullheads, white suckers, sheepshead, yellow perch, white bass, smallmouth bass, and rock bass). No direct cause for the mortality could be given although the author stated possible causes as predation, diseases and parasitism, pollution, and physical damage caused by man. Most causes of high fish mortality rates were related to commercial and sports fishing activity. The need for further research is stated. (Sjolseth-Washington)

THE EFFECTS OF SUSPENDED AND DEPOSITED SEDIMENTS ON ESTUARINE ORGANISMS; AN ANNOTATED BIBLIOGRAPHY OF SELECTED REFERENCES,
Maryland Univ., Solomons. Natural Resources Inst.
J. Albert Sherk, Jr., and Eugene L. Cronin.
Natural Resources Institute of the University of Maryland. Reference No. 70-19, April, 1970. 62 p, 179 ref. Contract No. DACW73-70-C-0013 by U.S. Army Corps of Engineers.

Descriptors: *Bibliographies, *Water pollution effects, *Sediments, *Bottom sediments, *Suspended load, *Estuarine environment, *Abstracts, Mollusks, Crustaceans, Benthic fauna, Annelids, Water quality, Disposal, Primary productivity.
Identifiers: *Annotated bibliographies, *Estuarine organisms, Literature reviews.

This annotated bibliography was prepared by screening approximately 1200 published and unpublished articles, papers, and books. Abstracts of 161 references are presented for all papers on the effects of suspended loads and deposited sediments on estuarine organisms. Articles are classified into 9 categories (Annelid worms, crustaceans, benthic species, engineering activities, mollusks, offshore disposal, fish, primary production, and sediment effects on water quality). Also included is a list of 18 references constituting a bibliography of bibliographies. (Sjolseth-Washington)

INFLUENCE OF LOG HANDLING PRACTICES ON WATER QUALITY,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
Frank D. Schaumbury.
In: Water studies in Oregon, Oregon State University Water Resources Research Institute Fall Quarter 1969 Seminar WR012.69, Corvallis, p 1-9, January 1970. 9 p, 7 fig.

Descriptors: *Water pollution sources, *Lumbering, *Wood wastes, Bark, Oxygen demand, Lignins, Dissolved oxygen, Toxicity, *Water pollution effects.
Identifiers: Log storage, Floating logs, Log handling.

Current logging and log handling practices contribute measurably to the pollution of natural waters in the Pacific Northwest. The significance of this contribution, however, must be carefully evaluated in each location where logging operations are underway. Logs held in water storage release measurable quantities of soluble substances to the holding water. Some of the substances add color to the water and some provide a food source for bacteria and other microorganisms ever present in the water. As more food is made available by this 'leaching' or diffusion process, more dissolved oxygen is consumed by the active microorganisms. If an excessive quantity of food material enters the water, the dissolved oxygen concentration in the water may be reduced below the minimum level required by fish and other aquatic life. Sunken bark forms a benthic deposit which provides a food source for microorganisms. The decomposition of bark creates a demand for dissolved oxygen from the overlying water. (See also W70-08475). 5D. Waste Treatment Processes

A GENERALIZED COMPUTER MODEL FOR STEADY-STATE PERFORMANCE OF THE ACTIVATED SLUDGE PROCESS,
Robert A. Taft Water Research Center, Cincinnati, Ohio.
Robert Smith, and Richard G. Eilers.
Available from the Clearinghouse as PB-192 764, $3.00 in paper copy, $0.65 in microfiche. Water Pollution Control Research Series, October, 1969. 80 p, 5 tab, 43 fig, 41 ref, 3 append. FWQA Project 17090--10/69.

Descriptors: *Activated sludge, *Model studies, *Computer models, *Computer programs, Mathematical models, Waste water treatment, Aeration, Biodegradation, Biological treatment, Nitrification, Oxygen requirements, Oxidation, Dissolved oxygen.

Mathematical models used to represent the activated sludge process are examined; means of analysis and computation of the differences and similarities between models are investigated. Two digital computer programs have been developed. The first program, the Continuous Steady State Activated Sludge (CSSAS) is a steady state model of the conventional activated sludge process flexible enough to simulate any of the proposed models. The second digital program Fill and Draw Activated Sludge (FADAS) attempts to simulate the biological activity in a fill and draw bench experiment in which activated sludge is mixed with substrate in any proportions. The FADAS program which has not been validated will be useful in interpretation of bench scale fill-and-draw experiments. The CSSAS program represents the most complete state-of-the-art computational procedure for quasi-steady-state performance of the activated sludge process but some important questions relating to design and operation of the process remain unresolved. However, further experimentation should ultimately result in a thoroughly reliable design tool.
W70-08165

STUDIES ON LIMESTONE TREATMENT OF ACID MINE DRAINAGE, OPTIMIZATION AND DEVELOPMENT OF IMPROVED CHEMICAL TECHNIQUES FOR THE TREATMENT OF COAL MINE DRAINAGE.
Bituminous Coal Research, Inc., Monroeville, Pa.

Available from the Superintendent of Documents, U.S. Gov't Printing Office, Washington, D.C., 20402-Price $1.25. Water Pollution Control Research Series, DAST-33, January, 1970. 96 p, 25 tab, 29 fig, 22 ref. FWQA Project 14010 EIZ---1/70.

Descriptors: *Coal mine wastes, *Neutralization, *Oxidation, *Sludge treatment, *Acid mine drainage, Limestones, Ferrous iron, Electrophoresis, Coagulation, Waste water treatment.
Identifiers: Magnetic sludges, Sludge removal, *Limestone treatment.

Four actual coal mine waters have been neutralized with limestone both on a batch scale and by utilizing a continuous flow apparatus. Variations in treatment procedure were necessary depending on the characteristics of the individual waters. A standarized test was established to evaluate the reactivity of the limestones. The following variables are of importance in evaluating limestones for coal mine water neutralization: (a) particle size, (b) Ca and Mg content, and (c) surface area. Ferrous iron oxidation has been accomplished with both synthetic and actual coal mine water at low pH in the presence of coal-derived activated carbon. Electrophoretic mobility studies on precipitates obtained by both lime and limestone neutralization of coal mine water yielded information which can be

pplied for more effective sludge removal. Magetic sludges were prepared using two different on-bearing waters. The conversion of precipitates a magnetic form results in significant reductions settled sludge volumes as well as increases in lids content, compared to the initially formed udge obtained by lime neutralization alone. Data btained in these studies indicate that the mestone process offers considerable promise for improved lower cost method for treating several pes of coal mine waters.

WATER/WASTE WATER GUIDE TO EUOPE, PART I: TREATMENT PRACTICES,
etroit Metropolitan Water Services, Mich.
lichael J. Taras.
/ater and Sewage Works, Vol 116, No 1, January 969. p 10-15.

escriptors: *Water treatment, *Water purificaon, *Waste water treatment, *Ozone, Chlorinaon.
lentifiers: *Ozonation, Europe.

his is the result of an eight-week survey of orthern European water and waste water treatent practices. Subjects covered include an overiew of European practice: ozonation, chlorinaon, flouridation, Russian treatment practice, utch treatment, practice, and the Rye Meads terary treatment plant. Treatment practices in Euope include combinations of impoundment reserirs, percolation through sand dunes, microstrainng, chlorination, ozonation, coagulation with hemicals, activated carbon adsorption, sedimentaon, and rapid and/or slow sand filtration. Europen water is harder than American water, and Euopeans often complain they see too many water oftening installations in their tours of the U.S. zonation is gaining popularity in Europe, both rom a standpoint of decreased cost of chemicals nd avoidance of formation of chlorophenols. hlorination and chloramination remain the domiant disinfectants of European water supplies. Rusian treatment practices resemble U.S. practices. In ddition to the rapid sand filter, the Russians use he new AKAHA filter which embodies and collecion pipe system in the middle of the sand bed, nabling water to be filtered by gravity through the pper portion of the bed, and by upflow through he lower portion of the bed. (Makela-Texas)

A WATER/WASTE WATER GUIDE TO EUROPE: PART 2: ANALYTICAL METHODS,
Detroit Metropolitan Water Services, Mich.
Michael J. Taras.
Water and Sewage Works, Vol 116, No 2, February 969, p 50-55. 1 tab.

Descriptors: *Water treatment, *Water purificaion, *Waste water treatment, *Water pollution, Analysis, *Analytical techniques, *River basin commissions, Standards.

Three books of analytical methods of examining water/waste water are found in widespread use in Europe. One is compiled by each nation with the im of standardizing results among the laboratories f that nation. The other two books are the latest editions of the World Health Organization Internaional Standards for Drinking Water and the Amercan Standard Methods for the Examination of Water and Waste water. Coliform counts are obained by multiple tube lactose broth fermentation nd membrane filter. The London Metropolitan Water Board has developed a synthetic glutamic acid medium which achieves better results than the conventional lactose broth. European analytical trends tend to parallel those of the U.S. Virtually all European laboratories possess a filter photometer and an ultraviolet-visible range spectrophotometer. Infrared and atomic adsorption spectrophotometers are gaining in popularity. A new apparatus named the Vorth Sapromat has received much consideration for its applicability in the analysis of biological treatment of waste water. The tendency in Europe is toward regional pollution control agencies, usually based on a whole river basin. These agencies, like the Emscher Association, regulate drainage conditions and waste water treatment in the river basin. Membership in the authority is mandatory, and financing is guaranteed by assessments on the members in proportion to the volume and noxiousness of their waste discharges. (Makela-Texas)

BUTTERFLY VALVES INSTALLED WITHOUT INTERRUPTION IN WATER SERVICE,
Pratt (Henry) Co., Aurora, Ill.
Bruce F. Ranney.
Water and Sewage Works, Vol 116, No 9, p 354-355, September 1969. 4 fig.

Descriptors: *Water distribution, *Valves, *Pressure conduits, Installation.
Identifiers: *Butterfly valve, *Line plug, Aurora, Illinois.

The main pumping station in the water distribution system of Aurora, Illinois, was successfully isolated so that repairs and maintenance work could be performed without interruption in service. The project consisted of the installation of two butterfly valves while the 16 inch distribution lines were under pressure. Advance valve installations performed the project by installing 2 plugs into the 16 inch mains with their special equipment. These plugs restrained the city water pressure while the butterfly valves were being installed. The valves were installed in less than two days. Similar installations can be made at sewage treatment plants where the same general type of valve difficulty occurs. (Galwardi-Texas)
W70-08295

INVESTIGATION AND REPAIR OF EXISTING SEWERS,
Underwater Tel-Eye Ltd. (Canada).
K. F. Perkins.
Water and Pollution Control, Vol 107, No 11, November 1969, p 32-33.

Descriptors: *Sewers, *Investigations, *Photography, Repairing, Pipes.
Identifiers: *Television cameras.

The technology of detection of sewer problems has been advanced by the introduction into the technology of photographic and television equipment. Cameras available include both two dimensional and three dimensional still photo cameras and battery operated motion picture cameras. Disadvantages of photographic equipment are the limited film load with its accompanying large interval between pictures, and inability to detect equipment malfunction or line blockage until the film is developed or the camera becomes stuck. The use of closed-circuit television avoids both these problems. It allows instantaneous viewing, with the capabilities of stopping the camera for study of a given area. Photographs can be taken from the surface monitor for future reference. TV cameras also show more detail than the naked eye can pick up. The camera can be repositioned to study the same area from different positions. Photographic systems should be more costly to operate than television systems due to reshooting costs, extensive picture review time, and film developing costs. In addition to use for inspection of existing sewer lines for problems, the television system can be used to inspect new lines prior to acceptance by the municipality. Even the contractor can use this service. (Makela-Texas)
W70-08296

FEDERAL GRANTS FOR MUNICIPAL WASTE TREATMENT--THE NEED FOR POLICY CHANGE,
Municipality of Metropolitan Seattle, Wash.
James R. Ellis.
Journal of the Water Pollution Control Federation, Vol 42, No 5, Part 1, p 679-684, May 1970. 1 tab, 2 ref.

Descriptors: *Grants, *Sewage treatment, *Legislation, Governments, Costs, Federal Government, Waste water treatment, Sewage, Construction.
Identifiers: *Incentives, Bonds, Growth.

The biggest problems are in big cities; however, the large metropolitan areas have been neglected sadly by the federal government and it is time to shift the balance. This can be done by adopting six changes in our federal policy. (1) Redress the large city inequity by authorizing incentive grants for qualifying new projects. (2) Make combined sewer overflow abatement facilities eligible for federal grants. (3) Make the federal grant commitment reliable as to receipt and adequate as to dollars. (4) Strengthen the market for local bonds by renouncing the abortive effort to tax municipal bonds by redressing the supply-demand equation by substantial federal support. (5) Develop regulatory standards which encourage local communities to direct their worst local problems and which will get the most pollution abatement for each federal and local tax dollar. (6) Encourage the local use of sewer service charges by offering a federal grant incentive, but do not permit any industry to destroy any stream for a fee. (Hancuff-Texas)
W70-08297

OXNARD SEWAGE PLANT SOLVES ODOR CONTROL PROBLEM,
Oxnard, Calif.
Stanley G. Pateman.
Water and Sewage Works, Vol 116, No 10, p 352-353, October 1969. 3 fig.

Descriptors: *Waste water treatment, *Odor, *Control systems, *Costs, *Industrial wastes, California.
Identifiers: *Farm produce wastes, *Malabate reodorants, Oxnard (California).

The Oxnard waste treatment plant has solved an extremely difficult odor control problem which resulted from the treatment of farm produce processing wastes. The system consists of fog spray nozzles which distribute a series of Malabate reodorants. The Malabates chemically treat the odors, not just mask them without raising the odor level. The Malabate reodorants do not corrode nozzles or pumps. Total installation cost of the complete system was less than $3,200 and chemical costs average less than $3.50 per day. The system is used only 6 to 8 hours per day. (Galwardi-Texas)
W70-08298

ARE PAVED DRYING BEDS EFFECTIVE FOR DEWATERING DIGESTED SLUDGE.
Virginia Polytechnic Inst., Blacksburg.
Clifford W. Randall.
Water and Sewage Works, Vol 116, No 10, p 373-376, October 1969. 6 fig, 1 tab, 7 ref.

Descriptors: *Sludge, *Sludge treatment, *Sewage sludge, *Dewatering, *Dry beds.
Identifiers: *Digested sludge.

The usefulness of paved sludge beds of center drain design for dewatering aerobically digested activated sludge is evaluated to determine if they provide a more economical solution than conventional sand beds. Paved bed design permits use of mechanical equipment for cleaning and thereby reduces the cost of labor and sand replacement. Anaerobically digested sludges dewater readily on partially obstructed paved beds due to the lateral drainage of water to the unobstructed portion of the bed. In this study, four beds were prepared, two of which were paved except for the center drain,

and two of which were conventional sand beds. Activated sludge from a municipal treatment plant was dried in 8 and 4-inch layers on the two types of beds. Sludge on the sand beds dewatered to less than 15% moisture content within 7-9 days for the 4 to 8-inch sludge layers, respectively. The sludges on the paved beds drained very slowly and after 10 days were still saturated. The author concludes that paved beds of center drain design are not desirable for dewatering aerobically digested sludge. Lateral drainage is poor and does not significantly contribute to the dewatering process. The poor drainage was not due to air binding of the sand drain, but to the nature of the sludge itself. (Makela-Texas)

Identifiers: *Bulking, Characteristics, *Sludge volume index.

Practically all problems of the activated sludge process are manifest by poor separation of sludge in the secondary sedimentation tank and an increase in effluent BOD because of respiratory oxygen consumption by sludge or organisms in the effluent. Loss of sludge organisms in the effluent may be caused by any or all of three things. (1) Poor design of the secondary sedimentation tank which results in the loss of septic sludge or billowing sludge in the effluent. (2) Rising sludges produced by biological phenomenon when overaerated sludge is produced by mechanical phenomenon. Both of these phenomenon are understood well and can be eliminated by corrections in the operation of the aeration tank. (3) The formation of a type of sludge which settles poorly. Dispersed growth, while not actually a form of activated sludge may form in an activated sludge process. Continuous formation of the dispersed growth indicates the entire waste treatment system was conceived poorly and should be redesigned completely. Bulking sludge, floating sludge, pinpoint floc, and deflocculated sludge are each complexes of several different types of sludge. Each needs further study before separation into component types and solution to specific problems is possible. Given adequate capacity in secondary sedimentation tank and return sludge pumps an activated sludge process can be operated successfully with a bulking sludge to produce an excellent quality effluent. There is no known way to get a good quality effluent from an activated sludge process which is producing large quantities of floating sludge, pinpoint floc or deflocculated sludge. (Hancuff-Texas)

INFLUENCE OF TURBULENCE ON THE ACTIVITY OF ACTIVATED SLUDGE FLOCS,
Technische Hochscule, Karlsruhe (West Germany)
L. Hartmann, and G. Laubenberger.
Journal of the Water Pollution Control Federation, Vol 40, No 4, p 670-676, April 1968. 8 fig, 3 tab, 4 ref

Descriptors: *Turbulence, *Oxygenation, *Reynolds number, *Activated sludge, Dissolved oxygen, Microorganisms, Temperature, Flocculation.
Identifiers: *Uptake rates, *Oxygen tension

Experiments related to the influence of turbulence on the activity of activated sludge flocs reveal the following results. (1) At high concentrations of organic material in the mixed liquor the transport of oxygen from the environment to the cell surface is the rate limiting link in the chain of biodegradation reactions. An increase in the oxygen pressure in the environment also results in an increase in the oxygen consumption by the floc. (2) Turbulence has a double influence; (a) the breaking apart of the agglomerated flocs into the bacterial colonies which are the smallest units of the floc, and (b) the exchange of contact area between bacteria and environment. Both phenomenon result in an increase of oxygen uptake. (3) Deflocculation starts while the fluid is still in laminar movement and extends to some degree into turbulent conditions. At Reynolds Number of around 5000 no further influence of water movement on the physical properties of the floc seem to occur. The influence of turbulence on the exchange of the contact layer between bacteria and water occurs mainly between Reynolds Numbers of 5000 and 9000. (Hancuff-Texas)

UNIT PROCESS PERFORMANCE MODELING AND ECONOMICS FOR CANNERY WASTE TREATMENT,
Water Resources Engineers, Inc., Walnut Creek, Calif.; and San Jose State Coll., Calif.
Denny S. Parker, John R. Monser, and Robert G. Spicer.
Proceedings, Industrial Waste Conference, 23rd, May 1968, p 710-739. 10 fig, 14 tab, 18 ref.

Descriptors: *Canneries, *Cost analysis, *Design criteria, *Economic efficiency, *Economics, *Optimization, Design data, Economic feasibility, Efficiencies, Model studies, Performance, Waste treatment, Waste water treatment.
Identifiers: *Unit processes, Waste characteristics.

Data from several unit processes was analyzed with reference to one particular cannery waste for the development of optimal design criteria. Due to the nature of the data, the input requirements for the system design procedure were termed cost-size-efficiency (C-S-E) relationships. Twelve alternative unit processes are analyzed including: activated sludge, lagoons and chemical waste treatment systems. In the system optimization analyses, the C-S-E relationships were used to determine the minimum cost solution. Design data and costs for an 8 MGD activated sludge plants are presented for the least cost solution for each level of efficiency. At the lower efficiencies, aeration costs go down, but clarification costs rise. A linear regression model predicting BOD removal efficiency is presented for lagoons, although the use of lagoons is not recommended for cannery wastes due to the lack of nitrogen and the shock loading a lagoon receives when the canning season begins. Chemical precipitation combined with sedimentation allowed BOD removals to approach 50%. Chemical oxidation with potassium permanganate offers attractions in its simplicity of operation and ease of control. Economic considerations would be the main determinant in its selection. CHEMICAL CONDITIONING OF BIOLOGICAL SLUDGES FOR VACUUM FILTRATION,
Notre Dame Univ., Ind.
Mark W. Tenney, Wayne F. Echelberger, Jr., John J. Coffey, and Timothy J. McAloon.
Journal of the Water Pollution Control Federation, Vol 42, No 2, p RI-20, February 1970. 12 fig, 1 tab, 28 ref.

Descriptors: *Activated sludge, *Dewatering, *Flocculation, *Sewage treatment, *Sludge, *Vacuum drying, Filtration, Sludge treatment, Waste water treatment.
Identifiers: *Conditioning, *Polyelectrolytes, Chemical treatment, Flocculants, Flocculating, Sludge drying.

Polymeric flocculation produced biologically is a properly operating activated sludge process are not effective as sludge conditioners of waste sludge for dewatering by vacuum filtration. It is necessary to add chemical conditioners or synthetic organic polyelectrolytes to structure properly the waste activated sludge. Conditioner dosage was found to be affected by the carriage waste water quality parameters of pH, alkalinity, and phosphate concentration; and the sludge parameters of solids concentration, storage lime, and primary sludge mix ratio. The optimum pH for effective conditioning of the sludges tested was in the range of 6.0 to 7.0 for iron (III) and 4.5 to 5.5 for aluminum (III). An increase in either alkalinity, phosphate concentration, solids concentration, storage time, and primary sludge mix ratio required an increase in conditioner dosage necessary to enhance the dewatering of waste activated sludge. TREATABILITY STUDIES OF INDUSTRIAL WASTES EFFECTED THROUGH PROCESS SIMULATION,
Prosearch Ltd., Oakville (Ontario).
Robert W. Baker, and Frank Guillaume.
Water and Sewage Works, Vol 116, No 9, p 32-38, September 1969. 15 fig, 1 ref.

Descriptors: *Simulation analysis, *Industrial wastes, *Design criteria, *Waste water treatment, Lagoons, Biological treatment, Performance, Oil, Poultry.
Identifiers: *Treatability studies, Unit operations, Clarifier, Aerated Lagoons.

The importance of treatability studies effected through process simulation of the unit operations involved in a waste water treatment plant is emphasized. Treatability studies can be used to predict the cost-effectiveness of different unit operations. Effects on a waste treatment plant from new product development or changes in production techniques can safely and accurately be predicted in the laboratory using simulation techniques. Four case histories are presented. A clarifier performance comparison showed that suspended solids removal would be a fraction of what would be anticipated from using the widely accepted design criteria. The percentage of total carbon removed varied between 1.0 and 2.5 per cent and was independent of the hydraulic loading rate over the range investigated. Case No 2 involved a petrochemical complex discharging waste into a conventional lagoon. Studies showed that biological treatment was not an acceptable means of treatment. Case No 3 involved a chicken packing house waste and results showed that a partially mixed aerated lagoon would procide adequate treatment and that a completely mixed aerated lagoon would not be necessary. The last study relates to the frequent problem of a plant designed and built for a projected hydraulic and pollutional load which will not be attained for several years. (Galwardi-Texas)

TRANSIENTS IN THE ACTIVATED SLUDGE PROCESS,
Sterling Drug, Inc., Rothschild, Wis. Zimpro Div.
Paul V. Knopp, Donald G. Watts, and Gerald A. Rohlich.
Proceedings Industrial Waste Conference, 23rd, May 1968, p 894-913. 10 fig, 1 tab, 23 ref.

Descriptors: *Activated sludge, *Dynamics, *Effects, *Frequency analysis, *Organic loads, Model studies, Mathematical models, Organic matter, Variability, Waste water treatment.
Identifiers: *Shock loads, *Transients, Concentration.

Aspects of modeling the dynamics of the completely mixed activated sludge process are discussed and estimates of the effects of variation in the concentration of organic material in the treatment plant effluent are presented. The usefulness of frequency response analysis of input-output records from the activated sludge process was demonstrated. COD was shown to be a poor indicator of system

sponse and can probably be attributed to the fact at the COD measurement is far too gross a measurement to indicate the dynamic changes within e system. The activated sludge system can be escribed as a low frequency pass system. Further ork is required to determine the effect of variaon in flow, and finally, joint frequency response nalysis of systems for which both flow and concenation vary with time. Frequency response analysis actual operating plants is recommended as a eans of explaining output variation and to assist developing models for the control of the acvated sludge process. CONOMICS OF AERATION IN WASTE REATMENT,
mco Corp., Salt Lake City, Utah.
. A. Kalinske.
roceedings Industrial Waste Conference, 23rd, ay 1968, p 388-397. 3 fig, 6 ref.

escriptors: *Activated sludge, *Aeration, Economics, *Equipment, *Lagoons, *Waste eatment, Biological treatment, Waste water treatent.
entifiers: Diffused aeration, Mechanical aeration, rface aerators, Turbine aerators.

he economics are discussed of aeration for those robic processes where the organisms are kept in spension in the liquid waste; primarily the acvated sludge process and all its modifications, and -called aerated lagoons. Three principal oxgenation methods presently in use are: diffusion of mpressed air, diffused air with submerged turne dispersers, and mechanical surface entrainent aerators. Diffused air systems will average out double the power consumption of well esigned mechanical-type surface entrainment erators. Installation costs also favor the mechanial surface-type aeration systems. High strength astes can best be treated with activated sludge aving the O2 supplied by mechanical means. Use surface aerators in large lagoons can be the neapest method for treatment of a wide variety of dustrial wastes. The non-steady, clean water test chnique is the most useful and practical for valuating the O2 input efficiency of aeration quipment. The main factor that must be given areful attention is that the basic contents are roperly mixed by the aerator. (Aguirre-Texas)

escriptors: *Biological treatment, *Industrial astes, *Laboratory tests, *Toxicity, Biochemical xygen demand, Biodegradation, Chemical oxygen emand, Military reservations, Oxygen demand.
dentifiers: *Air Force, *Treatability, Field studies.

iodegradability studies on specific Air Force industrial wastes have indicated that many of these astes can be treated in a biological treatment ystem. These studies gave the toxic levels of these astes and degree of treatment to be expected in a omestic treatment plant. The wastes resulting rom paint stripping of aircraft, fire fighting foam, nd disinfecting operations were studied in the aboratory to determine biodegradability. Paint tripping waste at COD concentrations from 1000 3000 mg/l gave maximum removal rates. Above 000 mg/l COD the waste became toxic to the oranisms. The BOD5 value for the paint stripping aste was about 1/3 of the COD value, whereas the ffluent was about 1/8 the COD value. The fire ghting foam waste was not toxic to activated ludge microorganisms at COD concentrations of ,000 mg/l and to waste stabilization pond microoranisms at COD concentrations of 16,000 mg/l. OD removal for the ponds containing foam wastes averaged 94%. Formaldehyde from the disinfecting operations waste was completely removed from solution in 3 hours, by activated sludge, when the initial concentration was less than 30 mg/l but was only partially removed at concentrations of 100 mg/l or above after 8 hours aeration. THE ROLE OF PARTICULATE SUBSTRATES IN BIOTIC DEGRADATION OF ORGANIC MATERIALS,
Missouri Univ., Columbia.
Darrell L. King, and Rameshwar D. Verma.
Proceedings Industrial Waste Conference, 23rd, May 1968, p 75-86. 1 fig, 5 tab, 16 ref. OWRR-A-007-MO.

Descriptors: *Biodegradation, *Organic matter, Biochemical oxygen demand, Growth rates, Laboratory tests, Metabolism.
Identifiers: *Particulate substrates, Bacterial activity, Biological oxidation, Media.

Much of what is known about the activity of microbiological communities in the degradation of organic materials is based on studies in which the organic substrate was glucose present in the dissolved phase. Most wastes contain a significant amount of particulate material which serves as an attachment site for the heterotrophic microbiota and in many cases this available surface exterts a marked effect on bacterial activity. The objectives of this study were to determine the effects of the physical state of organic media on the metabolism of a complete aerobic community of microorganisms and on the bacterial portion of that community. The interactions between particulate material and increasing concentrations of dissolved organic nutrients available to the biota also were considered. From this study it became apparent that the presence of particulate materials in organic waste streams plays a significant role in determining the type and extent of energy fixation and utilization by populations of heterotrophic microorganisms. When particulate surface was available for bacterial colonization the energy conversion efficiency was roughly 50% while in the dissolved media only about 14% of the energy released during biotic activity was channeled into new biomass. DISSOLVED - AIR ION FLOTATION OF INDUSTRIAL WASTES HEXAVALENT CHROMIUM,
Kentucky Univ., Lexington.
Robert B. Grieves, Gregory A. Ettelt, J. Thomas Schrodt, and Dibakar Bhattacharyya.
Proceedings Industrial Waste Conference, 23rd, May 1968, p 154-164. 5 fig, 2 tab, 10 ref.

Descriptors: *Chromium, *Efficiencies, *Foam separation, *Optimization, *Regression analysis, Industrial wastes, Pilot plants, Surfactants.
Identifiers: *Floatation, *Ion flotation.

Efficiency of a pilot-plant scale, dissolved air ion flotation unit for the removal and concentration of dichromate is evaluated. Data obtained are subjected to a multiple regression analysis involving polynomial expressions. Equations, accurately representing the data are generated which relate the fractional flotation (removal) of dichromate, the enrichment ratio for dichromate, and the fractional flotation of surfactant to the five independent variables that were considered. The optimum values of the independent variables were: a polymer dosage 3.2 or 4.8% of the feed concentration of dichromate, a molar feed ratio of surfactant to dichromate of 2.1, 170% recycle, a detention time of 85 minutes, and a feed concentration of dichromate of about 100 mg/l. Including a feasible process of surfactant recovery, the approximate chemical cost is about $0.67 per lb of chromium. The primary advantage of the dissolved-air, ion flotation is the concentration of the chromium in a liquid volume less than one per cent of the volume of the waste. (Aguirre-Texas)

AEROBIC THERMOPHILIC PROCESS FOR THE BIOLOGICAL TREATMENT OF WASTES--SIMULATION STUDIES,
Clemson Univ., S.C.
Kawi Kambhu, and John F. Andrews.
Journal of the Water Pollution Control Federation, Vol 41, No 5, p R127-141, May 1969. 12 fig, 2 tab, 18 ref.

Descriptors: *Biological treatment, *Mathematical models, *Waste water treatment, *Simulation, *Thermophilic bacteria, Aerobic treatment, Digestion, Disposal, Temperature.
Identifiers: Garbage.

A mathematical model is developed for a thermophilic process using material balances for sludge and garbage, based on a complete-mixing, continuous-flow reactor with the reaction rate constant being expressed as a function of temperature. Oxygen, energy, and heat balances are made. Sufficient heat can be obtained through thermogenesis to maintain thermophilic temperatures (45 deg to 65 deg) thus making the process autothermal. The results presented should be considered only semiquantitative in nature since reliable values are not available for the effect of temperature on the rate constant. The simulations presented are for a mixture of primary plus waste activated sludge from a city of 10,000 population. Per capita contribution of total solids is assumed to be 0.2 lb/day of which 70% is volatile. Of the volatile solids, 70% is assumed to be biodegradable. Since low temperatures will be critical for the process, an outside air temperature of 2 deg C and an influent sludge temperature of 2 deg C are used. Oxygen requirements are assumed to be 1.4 lb of oxygen/lb of VS destroyed. Reactor temperatures over 100 deg F are attained at all residence times greater than 5 days. Too high an aeration rate can lower the reactor temperature and decrease the percentage of VS destroyed. Higher temperatures and increased VS destruction can be obtained by using thickening to increase the influent sludge solids concentration. (Aguirre-Texas)

ADVANCES MAKE WASTE WATER FILTRATION ECONOMICAL AND EFFECTIVE SOLUTION,
Graver Water Conditioning Co.
Robert Dvorin.
Industrial Wastes, Vol 116, No 9, p 12-16, Sept 1969. 5 fig, 6 ref.

Descriptors: *Waste water treatment, *Filtration, *Deep will pumping, *Municipal wastes, Tertiary treatment.
Identifiers: *Dual media, *Air scouring, *Bed depth, *Steel mill wastes.

Filtration technology progress has increased the applications of filters for waste water treatment flow rates have increased to 5-15 gpm/sq.ft with the use of dual media and increased bed depths. Also waste waters containing higher concentrations of suspended solids can be filtered. Air scouring is required along with conventional water backwash on filters operating on high concentrations of suspended solids. An underdrain system, Roto-Scour, discharges all the air and water within 1/4 inch of the filter bottom. Thus applications of filters operating on waste water are steel mill scale filters, municipal tertiary treatment filters and deep well disposal filters. Filters treating a steel mill scale waste having a suspended solids concentration of 100-150 mg/l can be operated at a flow rate of 15 gpm/sq ft. with a cycle time of 12-16 hour and produce an effluent normally containing less than 10 mg/l suspended solids. Tertiary filters can reduce suspended solids from 20-40 mg/l to less than 5 mg/l with a flow rate of 5-7 gpm/sq.ft. Wastes containing between 10-200 mg/l suspended

solids have been filtered before deep well disposal. (Aguirre-Texas)

EFFECTS OF LOADING ON A BIOLOGICAL TERTIARY TREATMENT SYSTEM,
Washington Univ., Seattle.
H. Kirk Willard, and D. A. Carlson.
Proceedings Industrial Waste Conference, 23rd, May 1968, p 740-753. 9 fig, 3 tab, 20 ref.

Descriptors: *Biological treatment, *Mathematical models, *Tertiary treatment, Activated sludge, Effects.
Identifiers: *Aufwuchs biocoenose, *Loadings, *Particulate removal, Suspended solids.

A new two-phase biological tertiary waste treatment system has been proposed. It includes an aerobic bacterial growth unit and a particulate removal unit. In a study of the second phase, the effects of SS loading on a community of attached particulate feeding organisms were determined. Bacterial substrate utilization and growth of the aufwuchs biocoenosis could be described as follows: F (S0-S1) = mu (S1) (A) (gamma)/ (Ks+S1)Y. The maximum growth rate constant mu was determined to be 0.026 and the half-rate constant Ks was 6.2 mg/l. A biomass yield of 16% of the influent SS for the particulate feeders produced a low effluent solids concentration of only 0.069 mgSS/mg BOD removed. Total dissolved organic carbon was over 90% destroyed in the bacterial and aufwuch's units. Similar removal values of 90 to 94% were measured for BOD. The decreases of both organic carbon and BOD were higher at lower loading rates. A method for the rapid removal of SS and carbonaceous materials can now be used based on a rational mathematical approach. (Aguirre-Texas)
W70-08313

EVALUATION OF THE KRAUS MODEL OF ACTIVATED SLUDGE BULKING,
Northwestern Univ., Evanston, Ill.
Wesley O. Pipes, and Frank S. Meade.
Proceedings Industrial Waste Conference, 23rd, May 1968, p 111-125. 5 fig, 7 tab, 8 ref.

Descriptors: *Activated sludge, *Evaluation, *Kinetics, *Mathematical models, *Sludge, Biochemical oxygen demand, Organic matter, Sludge treatment.
Identifiers: *Bulking, *Kraus Model, *Sludge volume index, Solids.

Most of the proposed kinetic models of the activated sludge process interpret effluent BOD as being caused by organic matter which was originally present in the influent waste, but not removed in the aeration tank. Sludge solids lost in the effluent from the secondary settling tank will cause a high effluent BOD which is not due to unchanged organic matter from the influent. Bulking sludge can lead to the loss of sludge solids in the effluent, the amount of which could be predicted from the sludge volume index in a formulation developed by Kraus. An evaluation of the Kraus model was made based on two hypotheses: (1) the sludge volume index of a sludge sample remains constant with respect to time if no new sludge particles are formed, and (2) the sludge volume index of a mixture of two different sludge samples is the weight fraction sum of the SVI of each sample. The SVI of most samples of normal sludge (SVI 100 ml/gm) will remain constant during aeration for a few days. The mixture of two different sludge samples is not necessarily the weight fraction sum of the SVI of each sample. (Aguirre-Texas)

INSTRUMENTATION FOR RESEARCH ON BIOLOGICAL PROCESSES,
Moore Products Co., Knoxville, Tenn.
Charles W. Crawford, Kawi Kambhu, and John F. Andrews.
Proceedings Industrial Waste Conference, 23rd, May 1968, p 1039-1053. 16 fig.

Descriptors: *Automatic control, *Biological treatment, *Data processing, *Instrumentation, *Research equipment, Control, Data collections, Data storage and retrieval, Digital computers, Measurement, Waste water treatment.
Identifiers: *Data acquisition system, Process variables.

Many of the limitations of previous studies on biological processes used for waste treatment have been due to the many variables involved, time requirements for bringing the microbial cultures to steady state, and a lack of control of some of the more important variables. Significant advances could be made in the solution of these problems by using appropriate instrumentation for automatic control and analysis of important variables and automatic collection and formating of data for direct entry into a digital computer by using a data acquisition system. Measurement and control of process variables includes: (1) Gas composition; (2) Gas flow rate; (3) Dissolved oxygen; (4) Temperature; and (5) pH. A beckman DEXTIR data system was used for the automatic collection and formating of data for direct entry into a digital computer. This is an expandable data acquisition complex which is designed to accept signals from various sensors located within several research laboratories and channel them to a centralized processing unit. The instrumentation and data acquisition systems described have only recently been placed in operation and the results of operating experience are therefore not available. (Aguirre-Texas)

PERFORMANCE OF INTERNALLY CLARIFIED ACTIVATED SLUDGE PROCESS TREATING COMBINED PETROCHEMICAL-MUNICIPAL WASTE,
Union Carbide Corp., South Charleston, West Va.
G. W. Kumke, R. A. Conway, and J. P. Creagh.
Proceedings Industrial Waste Conference, 23rd, May 1968, p 567-582. 13 fig, 5 tab, 7 ref.

Descriptors: *Activated sludge, *Efficiencies, *Industrial wastes, *Municipal wastes, *Organic loading, *Performance, Chemical wastes, Oil wastes, Waste treatment, Waste water treatment.
Identifiers: *Internally clarified, *Joint treatment, *Petrochemical wastes.

A four-year evaluation of the treatment of a combined petrochemical-municipal waste in full-scale aerator-clarifier units has been completed. The performance data for this type of activated-sludge process indicate that the removal capacity of BOD5 from the mainly petrochemical waste at an 80% efficiency reaches 180 lb/day/1000 cu ft. aeration volume. An average removal of 130 lb BOD5/day/1000 cu ft. was obtained. A concentration of 5000 mg/l of highly active biological solids could be maintained to accommodate wide variation in waste water strength and constituents. The effects of detention time, organic loading, and sludge age on performance were delineated. BOD removal varied from 73 to 93% over a range in retention times of 5.5 to 15 hours. A gradual decline in BOD5 removal from 86% to 80% was observed with a loading increase of from about 130 to 230 lbs BOD5/day/1000 cu ft. Little correlation existed between sludge loading and BOD5 removal in range of 0135 to 1.6 lb BOD5/day/lb MLSS. The aeration solids were maintained between 4000 and 6500 mg/l throughout the four-year operating period to provide a buffer to accommodate the variability of the industrial waste. (Aguirre-Texas)

WASTES FROM THE PRESERVATION OF WOOD,
Mississippi State Univ., State College.
E. Joe Middlebrooks, and Erman A. Pearson.
Proceedings Industrial Waste Conference, 23rd, May 1968, p 213-228. 8 fig, 2 tab, 5 ref.

Descriptors: *Biological treatment, *Chemical precipitation, *Creosote, *Preservation, *Toxicity, *Wastes, *Wood preservatives, Laboratory tests, Oil phenols, Waste treatment.
Identifiers: Gulfport, Mississippi.

Little information is available dealing with the treatment of wood preservation wastes, and the results in this report should be useful as a guide in designing waste treatment facilities for other wood preservation plants. The waste contains toxicants but it is amenable to biological treatment. The COD of the effluent from the biollogical process ranged from 1600 to 2000 mg/l resulting in a removal of about 50%. A significant reduction (70%) in the chemical and biochemical oxygen demand was achieved by flocculating the waste with lime (CaO). Chlorination alone did not effectively reduce the COD of the waste. Chemical flocculation followed by chlorination reduced the COD of the waste by 85% and reduced the phenol concentration to less than 0.5 mg/l. (Aguirre-Texas)

SEWERAGE PLANNING IN GREATER STOCKHOLM AREA,
Stockholm City Municipal Services Dept. (Sweden).
Anders Cronstrom.
Water and Sewage Works, Vol 116, No 9, p 356-358, Sept 1969. 3 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewage disposal, *Sewerage, *Nutrients, *Regional analysis, Treatment facilities, Biochemical oxygen demand (BOD), Planning.
Identifiers: Stockholm (Sweden), Tunnel systems.

Intensive population redistribution within and to the Greater-Stockholm area is expected by the year 2000; consequently large and difficult sewerage problems will be created. Population in the area is expected to increase through urbanization from the present 1.5 million people to 2 to 2.5 million. Alternative regional plans for biological sewerage treatment are presented with an objective of constructing treatment plants which would provide at dry weather inflow and normal operating conditions an efficiency of 95% removal of BOD. One alternative calls for construction of a tunnel system to convey all sewerage to a treatment plant which would sewer the entire area and have an ocean discharge. The other alternative considers using existing plants along with new regional treatment plants and a tunnel system which would only serve as an outlet conduit to better receiving waters. The problem of nutrient removal is being investigated. (Galwardi-Texas)

BACTERICIDAL EFFECTS OF ALGAE ON ENTERIC ORGANISMS,
Texas Univ., Austin. Center for Research in Water Resources.
Ernst Davis, and Earnest Gloyna.
FWPCA Grant 18050 DOL. Technical Report EHE-70-06, CRWR-55, 132 p, Mar 1970. 9 fig, 144 tab, 60 ref.

Descriptors: *Algae, *Cultures, *Enteric bacteria, *Oxidation lagoons, *Pathogenic bacteria.
Identifiers: *Autogomistic effects, *Axemic cultures, *Dieoff rates, Aftergrowth, Blue-green algae, Field studies, Green algae, Laboratory studies.

A series of experiments involving the effects of blue-green and green algae on the dieoff rates of selected bacteria were conducted. Axemic cultures of Anabaena cylindrica, A. nidulans, Oscillatoria chalybia, Chlorella pyrenoidosa and Scenedesmus obluguus among others. Cultures of enteric bacteria species (Adcaligeues faecalis, Enterobacter aerogenes, E. coli, Proteus vulgaris, Psudomonas aerarginosa, and Serratia marcercens) were added to the oxenic algal cultures during different periods of the algal life cycles. Filtrate from actively growing algae was exposed to cultures of enterics to determine whether any antibiotic compounds were

parted to the medium during lag phase growth of gae. To determine aftergrowth of the enteric spe-es, the duration of the tests was extended to about days. Mixed cultures of green and blue-green gae were exposed to both single species of enteric cteria and mixed cultures. Mixed algal cultures use a greater dieoff among the enteric bacteria an do individual species of algae. The dieoff aracteristics of pathogenic species, namely Sal-onella typhosa, S. paratyplin, Shigella dysen-iae, S. paradysentesiae, and Vibrio comma were o determined. The pathogenic species did not rvive as long as the enteric test species under nilar test conditions. Virtually no aftergrowth s detected on the part of the pathogenes. guirre-Texas)

laboratory test is developed which yields quan-ative information on the expected performance centrifuges in dewatering of any particular dge. The laboratory tests were conducted at rious treatment plants around Scandanavia and e results correlated with prototype centrifuge rformance. Only the bowl or decanter type cen-fuges were tested as these are by far the most mmon machines used for sludge dewatering. aterials other than sludge were not considered d therefore, it can not be assumed that the tests ll be equally applicable to other materials. The riables effecting centrifuge performance are di-ded into two types of parameters--machine varia-es and process variables. The most important rameters are listed. The machine variables in-ude centrifugal force, pool depth, and scroll rota-onal speed. The process variables are residence ne and sludge characteristics. A model to scribe centrifugal dewatering accurately must in-ude some measure of the two processes necessary r successful operation, settling, and scrolling. The ttling characteristics are determined through ntrifugation of four 10-ml samples. Scrolling aracteristics are determined through a sludge netrometer used to measure the sludge penetra-on. A light fluffly sludge has a poor consistency d can not be scrolled and therefore results in a w reading. The numerical differences between edicted and actual performance can be expected be within plus or minus 10%. (Hancuff-Texas)

veral statistical techniques are applied to time riations of waste treatment processes restricted municipal plants. The purposes of a time series alysis of municipal waste treatment plant data e (1) gain further insight into the nature of the riability of flow and biochemical oxygen de-and, (2) to develop additional measures of performance of treatment plants which may prove useful in estimating future variabilities, and (3) to relate the behavior of the treatment plant to resulting stream quality variation. The results indicate a high degree of variability in secondary effluent BOD as measured by the coefficient of variation. Values range from 0.2 to 1.1. The distribution of this variance over frequency show a strong seasonal dependence for plants subjected to seasonal canning load, 5 day on and 2 day off oscillations were also noted in a power spectrum of several plants. For one plant the amplitude of this weekly oscillation is about 20% of the mean load. The results of the time series analyses also indicate the effect that load variability can have on the water quality of a stream. In the final analysis, this is the primary reason for being concerned with plant variations. Dissolved oxygen variations of 1.0 mg/l or greater appear to be possible from a mathematical model of the stream and the observed treatment plant spectrum. The theory indicates that the maximum DO variability will occur at the location of the critical DO deficit. (Hancuff-Texas)

EFFECT OF OXYGEN TENSION ON O2 UPTAKE AND SLUDGE YIELD IN COMPLETELY MIXED HETEROGENEOUS POPULATIONS,
Merck Sharp and Dohme Research Labs., Rahway, N.J.; and Oklahoma State Univ., Stillwater.
M. David Rickard, and A. F. Gaudy.
Proceedings, Industrial Wastes Conference, 23rd, May 1968, p 883-893. 6 fig, 23 ref.

Descriptors: *Mixing, *Oxygen requirements, Activated sludge, Biological treatment, Waste water treatment.
Identifiers: *Completely mixed system, *Oxygen tension, *Oxygen uptake, *Sludge yield.

Operation of a completely mixed steady-state reactor at constant agitation (velocity gradient) but varying oxygen tension has shown that oxygen uptake rate and biological solids yield remained relatively constant for the range of DO concentrations between 1.4 and 7.1 mg/l. In addition, no effect was noted on the amount of RNA or protein contained in the cells. Also, as oxygen concentration was increased, there was a slight increase in DNA content of the cells, and a small improvement in both COD and glucose removal efficiency. There was a significant decrease in carbohydrate content of the cells. Concerning oxygen uptake rate, it may be concluded, based upon the present results and the work previously reported, that agitation of the system exerts an effect independent of oxygen tension at values above those accepted for critical DO concentration. INTERRELATIONS BETWEEN BIOLOGICAL AND CHEMICAL CHARACTERISTICS IN ANAEROBIC DIGESTION,
National Inst. for Water Research, Pretoria (South Africa).
P. G. Thiel, D. F. Toerien, W. H. J. Hattingh, J. P. Kotze, and M. L. Siebert.
Water Research, Vol 2, No 4, p 393-408, Apr 1968. 2 fig, 9 tab, 19 ref.

Descriptors: *Anaerobic digestion, *Ecosystems, *Correlation analysis, Laboratory tests, Chemical oxygen demand, Nitrogen, Enzymes, Failures.
Identifiers: *Characteristics, *Linear correlation coefficients, *Volatile acid concentration, Bacterial counts, Gas productions.

The ecosystem of anaerobic digestion including determinations of both biotic and environmental characteristics and the interrelations between these characteristics was investigated. Three 14-liter laboratory-scale digesters were fed a synthetic substrate which contained limiting amounts of nitrogen, COD:N ratio of 135:1. The characteristics of these three digesters were followed daily until failure of digestion occurred as a result of the nitrogen deficiency. A significant increase in volatile acid concentration was taken as digester failure. Digester failure was noted after 12, 17 and 22 days. The daily observations included gas production data, chemical quality determinations, bacterial counts, and the determination of a wide range of intermediary metabolic enzymes. Linear correlation coefficients were determined between all the different characteristics observed. Significant correlations were found between many of the different characteristics. The changes taking place in the characteristics until failure occurred and the implications of some of the correlations found are discussed. (Galwardi-Texas)

ANALYTIC AND PROCESS CLASSIFICATION OF EFFLUENTS,
Connecticut Univ., Storrs.
T. Helfgott, J. V. Hunter, and D. Rickert.
Journal, Sanitary Engineering Division, Proceedings, American Society of Civil Engineers, Vol 96, No SA3, p 779-803, June 1970. 11 fig, 13 tab, 40 ref.

Descriptors: *Waste water treatment, *Classification, *Effluents, Nutrients, Sewage treatment, Activated sludge, Membranes, Adsorption, Activated carbon, Organic chemicals, Electrodialysis, Membrane processes, Amino acids, Filtration, Turbidity.
Identifiers: Fractionation.

A choice of processes and systems to remove specific contaminants from waste water can better be made if chemical constituents and physical interactions of waste waters are better known. The work is directed towards the achievement of higher quality effluents through advanced waste treatment. The results of three separate studies are presented. (1) Analytical description and process classification information on primary, secondary, and advanced waste treatment plant effluents is presented. Data representing the average of 22 different treatment plants are presented with respect to the percentage breakdown of total COD as represented by various organic material. A fairly extensive literature review is presented in regard to organic constituents of sewage. (2) Comparison is made between adsorptivity of soluble organics from sewage and a secondary effluents. Certain organic materials present in effluents are not removed by absorption. On the basis of Total Organic Carbon analyses using dosages of activated carbon, residual organics in effluents are found to range from 2 mg/l to 8 mg/l TOC. (3) A classification technique, gravitational electrodialysis (GED) is presented. The GED method is used to further classify the residual organics of activated carbon treated effluents. Data have been collected to show that the residual organics from high activated carbon dosed effluents contain relatively more soluble cationic material than effluents of secondary and primary treatment. These residual organics of activated carbon treatment appear to be electropositive (cationic) and of high isoelectric value as determined by gravitational electrodialysis fractionation. The sizes are roughly between 10A deg and 100A deg (pL 9-8) and 0.1 (pL6): pL being defined as the negative log of the particle in meters. It is hypothesized that this residual class of organics contain nitrogenous groups that are the degradation products of bacterial cell walls.

DESIGN OF U-TUBE AERATION SYSTEMS,
New Mexico State Univ., Las Cruces.
Richard E. Speece, and Rudolph Orosco.
Journal, Sanitary Engineering Division, Proceedings American Society of Civil Engineers, Vol 96, No SA3, p 715-725, June 1970. 4 fig, 2 tab, 7 ref.

Descriptors: *Aeration, *Design, *Mathematical model, *Oxygenation, Activated sludge, Bubbles, Regretion analysis, Headloss, Sewage treatment, Waste water treatment, Costs.
Identifiers: *U-Tube aeration, Efficiency.

Four independent parameters were studied in the design of U-Tube aeration systems. (1) air-water ratios, (2) inlet dissolved oxygen concentration, (3) depth, and (4) water velocity. Each different combination of parameters will result in different capital and operating costs. Outlet dissolved oxygen concentration is reported in this study for the following ranges of independent parameters. (1) air-water ratio-5 to 25%, (2) inlet dissolved oxygen-0 to 100% saturation, (3) depth-20 to 40 feet, and (4) water velocity-3.6 to 9.2 feet per second. The computer model of the gas transfer equation adapted to U-Tube aerator was used to evaluate the reaeration coefficient k2. Transfer of gases other than oxygen is analyzed. (Hancuff-Texas)

WATER QUALITY: COSTS BENEFITS OF IRREDUCIBLES,
Stone (Ralph) and Co., Inc., Los Angeles, Calif.
Ralph Stone, William Garber, and Helen Friedland.
Journal, Sanitary Engineering Division, Proceedings American Society of Civil Engineers, Vol 96, No SA3, p 691-697, June 1970. 1 fig, 4 tab, 2 ref.

Descriptors: *Costs benefit analysis, *Water resources, *Water quality, Economics, Surveys, Research and development, Statistics, Social aspects, Sewage treatment, Value engineering, Decision making.
Identifiers: *Questionnaire, *Advanced waste treatment, Algorithm.

The ASCE Committee on Sewerage and Sewage Treatment Design designed a questionnaire for distribution to Sanitary Engineering Division membership. The purpose of the questionnaire was twofold: (1) to determine the memberships attitudes and opinions concerning the existing and future social and economic value of alternative beneficial uses of the nation's water resources, and a few general questions relating response to immediate operational experience; (2) to demonstrate an algorithmic technique for quantifying nondeterministic or probabilistic data. Approximately 350 division members (20%) responded. They gave value judgement ratings (range from 1 to 10) for social and economic benefits. The analysis of questionnaires was based on both an algorithmic mathematical formulation and the Delphi method developed by the Rand Corporation. Both concepts were tested and found to support three basic premises: (1) the opinions of a large sample of informed persons have significant value, (2) qualitative judgments can be quantified by use of an abstract scale of relative values, and (3) averaging ranking and normalizing the resulting data provides tools for further information analysis. The study indicated that it is possible to quantify to a degree qualitative information, that sanitary engineers are aware of important social values, and that although existing research and development work is making a significant contribution this technological level can be greatly improved. FILTRATION OF CHLORELLA THROUGH DUNE-SAND,
Technion-Israel Inst. of Tech., Haifa (Israel).
Yair Folkman, and Alberto M. Wachs.
Journal, Sanitary Engineering Division, Proceedings American Society of Civil Engineers, Vol 96, No SA3, p 675-690, June 1970. 15 fig, 2 tab, 18 ref

Descriptors: *Filtration, *Mathematical model, *Chlorella, Groundwater, Headloss, Stabilization, Ponds, Performance, Sewage treatment, Salinity, Effluents, Reclamation
Identifiers: Concentration Efficiency

To study processes occurring when effluents of stabilization ponds are used in artificial groundwater recharge, algae concentration experiments were conducted using a long column filled with dune-sand. A unicellular algae, chlorella, was used varying in size from 3 mu to 5 mu. Under conditions of darkness such as those prevailing in the experimental setup, Chlorella cells divide into smaller dark cells and their size distribution range becomes narrower; consequently, the efficiency of filtration is decreased. For all filtration velocities ranging from 1 to 6 meters per day, the retention of algae occurred mostly in the upper part of the sand column where the increments of headlosses were observed. The hydraulic gradient remained practically constant in the rest of the column. Changes of the relative concentration of algae as a function of depth closely corresponded with the filtration equation proposed by Ives (Proceedings Institution of Civil Engineering 16: 189-193, June 1960), when a coefficient 'b' was introduced to account for algae multiplication. The effect of cation concentration in water on the efficiency of filtration was clearly shown. The addition of cations to filtration water produced significant increases in that efficiency. When lower velocities were used, larger quantities of water could be filtered and the filtration efficiency would be higher. (Hancuff-Texas)

UNIFIED BASIS FOR BIOLOGICAL TREATMENT DESIGN AND OPERATION,
Stanford Univ., Calif.
Alonzo W. Lawrence, and Perry L. McCarty.
Journal, Sanitary Engineering Division, Proceedings American Society of Civil Engineers, Vol 96, No SA3, p 757-778, June 1970. 4 fig, 6 tab, 48 ref.

Descriptors: *Kinetics, *Biological treatment, *Activated sludge, *Anaerobic digestion, *Mathematical models, Growth, Design, Operations, Chemical oxygen demand, Biological oxygen demand, Nitrification, Digestion.

Biological solids retention time (SRT) is related to the performance of continuous biological processes employing suspensions of microorganisms in a fundamental way; therefore, SRT is suggested herein for use as an independent parameter in biological treatment process design and control. Steady-state kinetic models are presented for three process configurations, i.e., completely mixed reactor without solids recycle, completely mixed reactor with solids recycle, and plug flow reactor with solids recycle. Reported values of kinetic coefficients are tabulated for aerobic treatment of organic wastes, for aerobic treatment with nitrification, and for anaerobic treatment of organic wastes. The minimum solids retention time of models are compared with those for actual treatment systems and found to correlate quite well. (Hancuff-Texas)

ENUMERATION, ISOLATION AND IDENTIFICATION OF SULPHATE-REDUCING BACTERIA AN ANAEROBIC DIGESTION,
National Inst. for Water Research, Pretoria (South Africa); and National Inst. for Road Research, Pretoria (South Africa).
D. F. Toerien, P. G. Thiel, and Maria M. Hattingh.
Water Research, Vol 2, No 5, p 505-513, May 1968. 1 fig, 7 tab, 24 ref.

Descriptors: *Anaerobic digestion, *Anaerobic bacteria, *Isolation, *Sulfur bacteria, Sewage sludge, Sewage treatment.
Identifiers: *Desulfovibrio desulfuricans, *Enumeration, Sulphate-reducing bacteria, Ray.

Sulphate-reducing bacteria present in the anaerobic digestion of raw sewage sludge were isolated and enumerated utilizing a method in which anaerobiosis was achieved by the use of media with a low redox potential in stoppered bottles containing oxygen-free gas atmospheres. Carbon dioxide-bicarbonate buffer systems were employed in the media. Seven pure cultures of sulphate-reducing bacteria of the species Desulfovibrio desulfuricans were isolated from digesters being fed raw sewage sludge. No evidence for the presence of sulphate-reducing bacteria of the genus Desulfotomaculum was found. Sulphate-reducing bacteria occurred in numbers of 3-5 x 10 to the 4th power/ml in a raw sewage sludge digester. This low count indicated that these bacteria are not usually a major group in anaerobic digestion. Sulfate-rich water was added to the media and the counts increased to .7-95.0 x 10 to the 6th power/ml. (Galwardi-Texas)

CURRENT TRENDS IN FARM WASTE DISPOSAL,
Ministry of Agriculture, Fisheries and Food, London (England).
C. T. Riley.
Water Pollution Control, Vol 69, No 2, p 174-179, February 1970. 3 tab.

Descriptors: *Animal wastes, *Farm wastes, Cattle, Hogs, Poultry, Odor.
Identifiers: *Manure, *Population equivalents.

Much emphasis has been placed on farm waste disposal in the past five years. Reasons for this include the increased size of livestock units, nearness of units to consumers, recent legislation on river pollution control and water resources, and reaction from the public and farm workers to flies and odor associated with animal wastes. In 1967, the total volume of excreta produced by livestock in the United Kingdom was 121 million tons, with a population equivalent of 136 million. Much of this excreta is spread on the land by ranging animals. The remainder must undergo some form of disposal by man. The wastes can be handled in any of four basic methods. (1) as a solid, it is stored and spread on land once or twice a year. (2) as a semi-solid, it is spread daily. (3) as a slurry, it is handled by vacuum tanker, stored, and spread. (4) as a liquid, it is washed by water to a storage tank and spread by spray irrigation. The trend is toward solid or semi-solid handling. Factors affecting disposal method include land availability, land area, volum of excreta, soil type, crops to be grown, and climatic conditions, especially rainfall. More emphasis is now placed on planning of waste disposal before starting farm projects. Odors can be eliminated by aeration of wastes in the tanker before spreading or spraying on the land. (Makela-Texas)

TREATMENT, USE, AND DISPOSAL OF WASTES FROM MODERN AGRICULTURE,
Water Pollution Research Lab., Stevenage (England).
A. B. Wheatland, and B. J. Borne.
Water Pollution Control, Vol 69, No 2, p 195-208, February 1970. 12 tab, 21 ref.

Descriptors: *Farm wastes, *Animal wastes, *Wastes disposal, *Waste treatment, *Waste water disposal, *Waste water treatment, *Biological treatment, *Sludge disposal, *Sludge treatment, Odor, Aerobic treatment, Incineration, Filtration, Hogs, Cattle, Poultry.
Identifiers: *Manures, *Vegetable washings.

With the trend toward larger concentrations of more animals on smaller areas of land nearer population centers, and the trend of the food industry to require washing and packing of vegetables on the farm, the farmer is faced with new problems in waste and waste water treatment and disposal. Values for quantity of excreta, solids, BOD, COD, PV, organic carbon, and total nitrogen are given for cattle, hogs, sheep, poultry, and man. Recent experimental work on animal waste treatment and disposal is discussed. The problem investigated was odor control during storage and spreading of piggery slurry by means of aeration. Problems which occurred included foaming and bulking of the slurry. The treated supernatant was to be recycled for use in washing the animal pens. Possible future methods of treating animal wastes include incineration, wet oxidation, and disposal at sea. Several analyses of vegetable washing waste waters are presented, giving volumes, pH, solids, BOD, COD, PV. Due to the variable nature of the processes in-

ved in vegetable preparation, the actual degree contamination of the waste water cannot be pre- ted accurately. Treatment includes minimizing quantity of waste water to be treated, and pri- ry, biological and sludge treatment and disposal. mary treatment includes screening and sedimen- ion. Biological treatment can be by lagoons, ated lagoons, oxidation ditches, extended aera- n, conventional activated sludge, contact sta- zation, spray irrigation, biological filtration, or h rate filtration. Sludges can be conditioned, de- tered and disposed at sea or on land. (Makela- xas)

ntifiers: *Nitrosomonas, *Optimum values, ure cultures, Michaelis constants.

strain of Nitrosomonas europaea was isolated m activated sludge effluent by a dilution method ich readily demonstrated the presence of con- ninating heterotrophs and yielded a high propor- n of tubes containing pure cultures of ammonia- dizing bacteria. Copper, sodium, calcium and gnesium stimulated growth of pure cultures, and ects of deficiencies of these metals were demon- ated. EDTA improved growth in the basal medi- , and abolished the toxic effect of added copper; was, however, inhibitory at low calcium concen- tions. The effect of pH value on the growth of N. ropaea appeared to be dependent on the metal content of the medium although the optimum value was always between 7.5 and 8. The owth rate constant in pure culture was similar to t previously observed for nitrification in Thames ter, but double that previously observed for rification of sewage by activated sludge. The chaelis constants for ammonia and oxygen bout 1 mgN/l and 0.3 mg/l, respectively) were nilar to those found for nitrification in activated dge. (Aguirre-Texas)

urteen previously unstudied strains of the genus esulfovibrio and eight thermophilic strains of the nus Desulfotomaculum were allotted to species the results of physiological and biochemical sts. On DNA base composition the Desulfovibrio rains fell clearly into three groups, corresponding Dv. Salexigeris, Dv. desulfuricans and Dv. Vul- ris. NaCl dependence appeared to be a constant d unique feature of Dv. salexigeris strains, and lfate-free' growth on pyruvate a constant aracteristic of Dv. desulfuricans, although one rain of Dv. Vulgaris also dismuted pyruvate. Fu- arate dismutation showed no species correlation. lfate-free' growth on choline was often minimal and the best appeared to be of little value. A high degree of resistance to Hibitane was not a constant characteristic of Dv. salexigeris. The thermophilic strains showed great uniformity in DNA base composition, Hibitane resistance and 'sulfate-free' growth, and were all classified as Desulfotomaculum nigrificans. (Aguirre-Texas)

CLEAN WATER AND ULTIMATE DISPOSAL,
BSP Corp., Brisbane, Calif.
Frank Sebastian, and Robert Sherwood.
Water and Sewage Works; Vol 116, No 8, p 297-300, August 1969. 5 fig, 3 tab, 6 ref.

Descriptors: *Cost comparisons, *Lime, *Sludge treatment, *Sludge disposal, *Costs, *Activated carbon, Phosphates, California.
Identifiers: *Recalcination, *Thermal systems, Lake Tahoe (California).

The unique application of thermal systems for solid waste reclamation and disposal at the South Tahoe Phosphate Removal and Water Reclamation Plant was presented. Three unique thermal processing systems were employed. Bartlet Snow Pacific multiple hearth furnaces were used in the thermal treatment systems. The first system processes a relatively wet dewatered sludge, 15-20 percent total solids, obtained from the addition of lime to raw primary sludge. Elimination of all odors and steam plume was obtained. Lime treatment of the sewerage plant effluent produces another distinct sludge which was centrifuged producing a cake of about 50% moisture. This sludge was recalcined at temperatures approaching 1900 deg F. for eventual recovery of the lime. Dry lime storage was possible without the associated dust problems by the application of a Thermal Disc Cooler. The TDC utilized water as the heat transfer liquid and decreased the temperature of the calcined lime from 1400 deg F to less than 400 deg F. There was virtually no recarbonation as the system was totally enclosed. The third system was used in the regeneration of activated carbon at the cost of $0.023 per lb. (Galwardi-Texas)

SCHOOL AND STATE COOPERATE FOR EFFECTIVE OPERATOR TRAINING,
Clemson Univ., Dept. of Environmental Systems Engineering, and Illinois Univ., Urbana. Dept. of Civil Engineering.
W. N. McLellon, John H. Austin, and J. F. Andrews.
Water and Sewage Works, Vol 116, No 2, p 46-49, February 1969. 2 ref.

Descriptors: *Education, *Training, Municipal wastes, Municipal water, Industrial wastes, Industrial water, Permits.
Identifiers: *Treatment plant operators, *Certification, *Manuals.

A great need exists for upgrading existing water and waste water treatment plant operator staffs both in quantity and quality. A progressive training program was instituted in the state of South Carolina in 1952 through the efforts of the South Carolina Water and Pollution Control Association and Clemson University. This program consisted of a series of correspondence courses extending through four levels of operator training. In addition, annual three-day short courses are held at Clemson followed by a certification examination. In 1966, South Carolina passed a law requiring mandatory certification of public water treatment plant operators. A similar law is expected for waste water treatment plant operator certification. Beginning in 1969, the faculty of Clemson University and the University of Illinois began a complete updating and improving of all correspondence course manuals. This set of manuals should serve as a very important tool in operator training programs. (Makela-Texas)

THE DECOMPOSITION OF ALIPHATIC ESTERS BY AEROBIC MICROORGANISMS,
Texas A and M Univ., College Station.
W. D. Langley, W. B. Davis, and P. A. Richards.
Proceedings Industrial Waste Conference, 23rd, p 229-241, May 1968. 7 fig, 3 tab, 12 ref. OWRR A-003-TEX, FWPCA 5T1-WP74.

Descriptors: *Biodegradation, *Cultures, *Gas chromatography, *Hydrolysis, Activated sludge, Alcohols, Byproducts, Metabolism, Oxidation.
Identifiers: *Removal rates, Esters, Substrates.

The removal of the acetate esters of C2-C6 normal alcohols has been observed in aerobic cultures of mixed population using direct injection aqueous gas chromatography as the analytical technique. The substrate-culture interaction results in the rapid hydrolysis of the ester with the appearance of the alcohol product in the aqueous phase providing its subsequent removal and oxidation is slower than the hydrolysis reaction. On a molar concentration basis, the rates of hydrolysis of the esters are virtually equal as are the rates of alcohol disappearance. In an aerated biological system, air stripping will compete with hydrolysis as a mechanism for ester removal and may constitute a significant factor in total removal. The lower molecular weight normal alcohols are relatively resistant to air stripping and will be removed primarily by biochemical mechanism. Removal rates for esters ranged from 530 to 879 mg/hr/g MLSS for ethyl acetate through n-hexyl acetate. Removal rates for alcohols ranged from 19.5 to 37.2 mg/hr/g MLSS for ethanol to 1-hexanol. FORMATION AND FINAL COMPOSITION OF THE BACTERIAL FLORA OF A DIARY WASTE ACTIVATED SLUDGE,
Agricultural Univ., Wageningen (Netherlands).
A. D. Adamse.
Water Research, Vol 2, p 665-671, 1968. 1 fig, 4 tab, 12 ref.

Descriptors: *Activated sludge, *Bacteria, *Dairy industry, Biological treatment, Laboratory tests, Microbiology, Milk, Waste water treatment.
Identifiers: *Coryneform bacteria, Flora, Oxidation ditch.

A comparison of the bacterial flora of a dairy waste activated sludge developing from the initial to the optimal stage in an oxidation ditch and in a laboratory apparatus, showed a close similarity between both systems, so that the latter may be used for representative experiments. Adaptation of the bacterial flora to the supplied waste was found to be a slow process. The composition of the flora altered with time until ultimately it consisted predominantly of caryneform (Arthrobacter-like) bacteria. Next to these, considerable amounts of Achromobacteraceae were found. Pseudomondaceae, initially present in large numbers, decreased to the 1 east important of the 3 major groups of bacteria. The alteration of the bacterial groups coincided with an alteration of the physiological characteristics of the total activated sludge flora. In the final stage two-thirds of the isolated bacteria gave a neutral reaction on Hugh and Leifson media and more than half were non-proteolytic. This is an agreement with the predominant position held by the group of conyneform-particularly Arthrobacter-like bacteria. The brown color of dairy waste activated sludge may be attributed to Flavobacteria. (Aguirre-Texas)

INFLUENCE OF SHAPE ON MIXING AND LOAD OF SEWAGE LAGOONS,
Mississippi State Univ., State College. Dept. of Civil Engineering.
Adnan Shindala, and William C. Murphy.
Water and Sewage Works, Vol 116, No 10, p 391-394, October 1969. 9 fig, 7 ref.

Descriptors: *Distribution patterns, *Mixing, *Organic loading, *Performance, *Sewage lagoons, *Shape, Waste water treatment.

Identifiers: *Influence.

The performance of sewage lagoons depends primarily on biological processes, and any factors which influence performance must necessarily be related to the biological environment of a lagoon. The most important factors which must be considered in the design and performance of an efficient lagoon are: temperature, light, organic loading, geometry, and hydraulic appurtenances. The amount of natural mixing and load distribution can be enhanced by proper selection of the size and shape of a lagoon and the location of inlets. This study presents the results of prototype experiments of various shaped lagoons. The data obtained indicate that load distribution in a sewage lagoon is influenced by the lagoon's shape. When comparing the distribution of the parameters in the entire lagoons, the rectangular lagoon showed a more uniform load distribution than its counterpart. (Aquirre-Texas)

EFFECTS OF PESTICIDES ON RAW WASTE WATER,
Tulane Univ., New Orleans, La. Dept. of Civil Engineering.
L. W. Canter, D. D. Nance, and D. R. Rowe.
Water and Sewage Works, Vol 116, No 6, p 230-234, June 1969. 5 fig, 4 tab, 3 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, Water pollution, Effects, *Pesticides, *Waste water treatment, Biological treatment, Dieldrin, Endrin, *Oxygen demand, Pesticide toxicity, *Bacteria, Biochemical oxygen demand, Toxicity.

The effect of commerical chlorinated hydrocarbon pesticide products on the oxygen demand of waste water and on growth characteristics of bacteria was examined. To evaluate the effect of commerical pesticide products on the oxygen demand of waste water, the BOD and COD tests were utilized. The toxic effect on the growth of bacteria was ascertained from the BOD results and from special bacterial growth studies using E. coli. In the range of 0-2 mg/l of dieldrin, the commerical dieldrin product caused an average increase in BOD of 130 mg/l for each mg/l increase in pesticide concentration. In the range of 0-5 mg/l of endrin, the commercial endrin product caused an average increase in BOD of 40 mg/l for each mg/l increase in pesticide concentration. In the range of 0-2 mg/l of equal pesticide mixtures, the average increase was 80 mg/l for each mg/l increase in the pesticide mixture. Concentrations of pure endrin up to 50 mg/l exhibited no additive effect to the BOD. The organisms were capable of surviving and growing for 24 hours in commercial pesticide concentrations up to 500 mg/l. The low solubility of dieldrin and endrin apparently inhibited the toxic action of these pesticides on bacteria. This inhibition was due to the unavailability of these pesticides for direct contact with the bacteria. (Aguirre-Texas)

ORGANICS REMOVAL BY A SELECTED TRICKLING FILTER MEDIA,
Texas Univ., Austin. Center for Research in Water Resources.
S. Balakrishnan, Wesley W. Eckenfelder, and C. Brown
Water and Wastes Engineering, Vol 6, No 1, p A22-A25, January 1969. 4 fig, 2 tab, 14 ref.

Descriptors: *Biological treatment, *Efficiencies, *Filtration, *Organic wastes, *Trickling filters, Biochemical oxygen demand, Retention, Waste water treatment
Identifiers: *Plastic media, Total organic carbon.

Organics removal characteristics of 1 1/2 inch polypropylene flexirings were evaluated. Mean residence times were determined in tracer studies using sodium chloride. Settled domestic sewage was treated in an 8 foot pilot plant trickking filter, and the organic removal characteristics in terms of BOD and TOC were measured. A correlation was developed between the specific surface of the media, applied BOD concentration, and the removal rate coefficient. Based on this correlation, it may be said that the flexiring media exhibits a removal rate of the same order of magnitude as other media having the same specific surface in terms of organics removal. Residence times studies showed that the mean residence time of a waste water through a bed of loosely packed, nonporous media was inversely proportional to the 0.45 power of the hydraulic loading rate for the media with slime. The residence time of the waste water in the medium with slime was about 5 to 6 times as large as that in a clean medium. The TOC and BOD of the feed ranged from 15.5 to 45.5 and 65 to 90 mg/l respectively. The average percent TOC removals through 8 foot depth of filter for hydraulic loadings of 12.5, 18.8 and 27 mgd per acre were respectively 57, 53, and 46. For the same conditions, the average BOD removals were respectively 66, 62, and 57%. (Aguirre-Texas)

THE SURFACE OF ACTIVATED SLUDGE PARTICLES IN RELATION TO THEIR SETTLING CHARACTERISTICS,
University Coll. of South Wales and Monmouthshire, Cardiff. Dept. of Microbiology.
C. F. Forster.
Water Research, Vol 2, p 767-776, 1968. 8 fig, 2 tab, 27 ref.

Descriptors: *Activated sludge, *Dewatering, *Electrophoresis, *Settling velocity, *Sludge, *Surfaces, Zeta potential, Waste water treatment, Sewage.
Identifiers: Electrokinetic properties.

The relationships of the surface properties of sewage sludges to their dewatering characteristics are reported. The measurement of the electrophoretic mobility of activated sludge particles was therefore included in the analysis of routine samples from a Lubeck pilot-plant. In constant ionic strength buffer solutions (I=0.2) no correlation was found between either the iso-electric points or the pK values of the sludge surfaces and the sludge volume index. Mobility measurements of the sludge particles in their own liquors, however, showed that the average mobility was directly proportional to the sludge volume index which in turn was a logarithmic function of the ratio of ammonia-nitrogen to soluble phosphate in the liquors. This would appear to indicate that the settling characteristics of activated sludges are governed by some metabolic process which can alter the nature of the surface of the sludge particles. BIOLOGICAL PARAMETERS FOR THE OPERATION AND CONTROL OF OXIDATION PONDS-II,
Department of Industries, Cape Town (South Africa). Div. of Sea Fisheries.
U. S. Tschortner.
Water Research, Vol 2, p 327-346, 1968. 9 fig, 7 tab, 24 ref.

Descriptors: *Algae, *Biological properties, Control, *Operation and maintenance, *Oxidation lagoons, Absorption, Biodegradation, Chemical oxygen demand, Chlorophyll, Lagoons, Ponds, Oxidation, Waste water treatment.

Oxidation ponds are an economical means of treatment for domestic sewage and industrial waste effluents, and are widely used in the less populated areas of warmer climates. Their action resembles the natural purification process of polluted river. They require less attention and skilled staff than mechanical systems. The successful performance of stabilization, however, depends on the biological balance of the system. The present study describes the development of parameters for the determination of the oxygen-producing community (parameters A and AP) and the efficiency of the pond on the breaking down of the load (parameter E). Parameter A reveals the relative fraction of chlorophyll-bearing organisms of the total load and allows a direct measurement of autotrophic pond performance. Parameter AP reveals the rate of photosynthesis and does not depend on variations of chlorophyll-a content of cells. Parameter E is based on the metabolism of algae and crustaceous; it estimates the contribution of both to the micropopulation and indicates the effectiveness of algae in removing pollution. Comparison of the COD contributed by dissolved and suspended solids, with the calculated values for algae and non-algal matter of the suspended fraction, revealed that in a well-balanced system more than half of the total COD is contributed by algal cells, the figure in the overloaded ponds being only 20%. KINETICS OF HYDROGEN ASSIMILATION IN THE METHANE FERMENTATION,
Engineering-Science, Inc., Oakland, Calif.
T. G. Shea, W. A. Pretorius, R. O. Cole, and E. A. Pearson.
Water Research, Vol 2, p 833-848, 1968. 5 fig, 6 tab, 5 ref.

Descriptors: *Fermentation, *Hydrogen, *Kinetics, *Methane, Bacteria, Anaerobic bacteria, Anaerobic digestion, Growth rates, Laboratory tests, Mathematical models, Waste water treatment.
Identifiers: Methano bacterium formicicum, Michaelis-Menten model.

The fermentation of methane from hydrogen and carbon dioxide has received considerably less biological engineering research emphasis than has methane fermentation of organic (volatile) acids, particularly acetic and propionic acids. As an initial step in determining the significance of methane production from hydrogen, this investigation was undertaken to evaluate the growth and kinetic characteristics of a species of the methane bacteria which ferment hydrogen in continuous culture. The generation time of the bacteria in the hydrogen enrichment fermentation was found to be 15.6 hours (hydrogen COD basis) and 13.2 hours (total COD basis); which is about one-third to one-fourth those described for methane bacteria by McCarty et al. Under the normal conditions of anaerobic fermentation of sewage sludge, hydrogen is generally less than 3% of the product gases. The saturation constants of hydrogen in the enrichment culture systems were found to be 569 and 724 mm Hg or 75 and 95% hydrogen based respectively on hydrogen and total COD removals. The results of the growth and kinetic study indicate that a continuous flow enrichment culture, predominant in hydrogen assimilating methane bacteria can be characterized well by the Michaelis-Menton model. Although the methane bacteria which ferment hydrogen are capable of high substrate conversion rates, the rate of hydrogen assimulation by these bacteria in a normal sludge digestion is computed to be less than 3% of the total methane production based on the Michaelis-Menten equation and the laboratory-determined constants. REMOVAL OF SUGARS BY ACTIVATED SLUDGE,
Water Pollution Research Lab., Stevenage (England).
H. A. Painter, R. S. Denton, and C. Quarmby.
Water Research, Vol 2, p 427-447, 1968. 7 fig, 9 tab, 27 ref.

Descriptors: *Activated sludge, *Biodegradation, *Organic wastes, Oxidation, Oxygen demand, Sewage, Waste water treatment.
Identifiers: *Sugars, Poly-beta-hydroxybutyric acid.

Conditions are described for affecting the ability of sludges, grown for the most part on sewage, to remove glucose, sucrose, and fructose, the most

ommon sugars found in domestic sewage. Sugars ere chosen for study since they comprise the ajor part of the soluble organic carbon present in omestic and other sewages. The sugars normally resent in sewage were removed from solution by ctivated sludge at much the same rate as was dded glucose (40-50 mg/l/hr). The Michaelis con-ants for sugars were in the region of 10 mg/l at 20 eg C. A simple relation was not found between OD loading and the ability of a sludge to remove ugars, but in general the higher the 'sugar loading' e greater the activity of the sludge. At the point f complete or near complete removal of sugar om solution, variable proportions of the theoreti-al amounts of oxygen were taken up, namely 10-0% for glucose and 8-26% for sucrose. No vidence of formation of significant amounts of oly-beta-hydroxybutyric acid was found in ac-vated sludge grown on sewage receiving normal nounts of glucose, though the presence of 0.5% olymer in sludge was established. It was con-uded that biochemical removal of soluble sub-rates is not a limiting factor in the activated-udge process, so that any limitation on the load pplied would appear to involve flocculation or eparation of sludge particles. ELF-PURIFICATION IN AN OPEN DITCH,
ppsala Univ. (Sweden). Inst. of Limnology.
ils Brink.
/ater Research, Vol 2, p 481-503, 1968. 19 fig, 5 ab, 19 ref.

escriptors: *Open channels, *Self-purification, Sewage, Flocculation, Organic matter, Pollution, batement, Sedimentation, Waste water treat-ent.

he self-purification of running water after pollu-on by sewage was studied in a ditch with a small ater depth. Both during winter (0-1 deg C) and mmer a high degree of self-purification with espect both to organic matter, nutrient salts and acteria was observed within a distance of 200-300 eters and during a time less than 4.5 hour. Floc-ulation and sedimentation of organic and inor-anic substances were the predominant processes, specially in winter, but also ordinary breakdown nd building-up of organic matter and nitrification ook place. At high flow in spring and autumn, eposited bottom sludge was carried away by the ream. Such an oxidation ditch, without disturbing rainage water from the surroundings during high ow, is well suited as an alternative method of eating sewage. A drop of up to about 90% in or-anic matter, nitrogen, and phosphorus over a istance of less than 300 meters was observed in inter and summer. The same was the case with oliform and general heterotrophic bacteria to near 00%. In spring and autumn no such decreases oc-urred. An oxygen sag was found during winter and mmer. A balance between oxygen and BOD5 was eached after 350 m. In spring and autumn no sag as found. (Aguirre-Texas)

iterature is reviewed and summarized pertaining o the taxonomy, morphology, cytology and nutri-on of members of the bacterial genus Sphaerotilus nd present limited unpublished data. Sphaerotilus an aerobe, although its oxygen requirements are eager. The optimum temperature is 15-30 deg C nd optimum pH near neutrality, although growth ccurs over a wide range of both. The genus phaerotilus consists of two valid species, S. natans utzing, S. discophorus Pringsheim, and possibly a third minute form which may be a subspecies of S. natans. Sphaerotilus spp. utilize a variety of organic acids, sugars and alcohols as carbon and energy sources. Glucose, however, represses synthesis of some enzymes in S. discophosus. Calcium and magnesium are necessary for growth. Iron and phosphates may be required in trace quantities but are toxic in low concentrations. Autotrophy remains to be proven in the genus. NEW WEST WINDSOR SEWAGE PLANT HAS MANY NOVEL FEATURES,
Grunwell Associates Ltd., Clarkson (Ontario).
Harry Grunwell.
Water and Pollution Control, Vol 108, No 5, p 20-21, 36, May 1970. 2 fig, 1 tab.

Descriptors: *Waste water treatment, *Treatment facilities, *Chlorination, Power system, Flow meters, Sludge disposal, Sludge treatment, *Sewage treatment.
Identifiers: Vortex grit removal, Windsor, Ontario (Canada).

The West Windsor Sewage Treatment Plant is an automated primary sewage treatment plant of 24 mgd, expandable to 60 mgd with secondary treatment. The capital costs for primary treatment, sludge removal and pumping totalled 7 million dollars. The plant contains several novel features: flow metering, vortex grit removal, dosage controlled chlorination, co-ordinated sludge dewatering system, closed circuit television, load sharing stand-by power sources, contract management by separate contract. The flow metering system consists of 2 flange mounted, propellor type flow meters with bearing purge systems. The accuracy of these meters over the range of pumping expected to apply, will be within plus of minus 2-3%. Grit removal is accomplished by using two, 15 ft. diameter aerated Vortex tanks using air lift grit removal. A chlorine residual recorder system is used to control chlorination. An automatic transfer system capable of providing stand-by power within 30 seconds of power failure has been installed. Two 1800 HP/1200 KW diesel generator sets are available to supply stand-by power. The use of thickening sections in the center bottoms of primary settling tanks, an automated pumping and vacuum filtration system and storage hoppers for cake storage prior to trucking are the main features of a co-ordinated sludge removal system. (Galwardi-Texas)

WILMINGTON GOES ON LINE WITH MODERN NEW SECONDARY TREATMENT PLANT.

Water and Sewage Works, Vol 116, No 12, p 471-473, December 1969. 6 fig.

Descriptors: *Waste water treatment, *Treatment facilities, *Air demand, *Performance, *Design criteria, Activated sludge, Biochemical oxygen demand, Costs, Delaware.
Identifiers: *Air supply blowers, Wilmington (Delaware).

Completion of a $4 million secondary sewage treatment facility allows Wilmington, Delaware to meet federal regulations governing water pollution. The treatment facility serves a population of 500,000 persons with a combined industrial and domestic flow of 60 mgd in 1968. The secondary treatment plant consists of two aeration tanks, each 14,400 sq ft. with a combined capacity of 3,230,000 gal and two final clarifiers with a combined capacity of 3,750,000 gal. Four rotary positive blowers provide a flexible supply of air to the aeration tanks. Two blowers are equipped with constant speed 250 hp motors and two with variable speed 250 hp motors. The BOD removal is approximately 55% for both primary and secondary plants. (Galwardi-Texas)

WET AIR OXIDATION AT LEVITTOWN,
Lower Bucks County Joint Municipal Authority, Pa.
Paul X. Blattler.
Water and Sewage Works, Vol 117, No 2, p 32-34, February 1970. 3 fig, 4 tab.

Descriptors: *Sludge disposal, *Treatment facilities, Performance, *Sludge treatment, *Oxidation, *Operating costs, *Capital costs, Vacuum drying, Temperature, Waste water treatment, Pennsylvania.
Identifiers: Wet oxidation, Low pressure oxidation, Levittown (Pennsylvania).

Levittown, Pennsylvania has solved its sludge disposal problem with the installation of a low pressure oxidation unit which provides wet oxidation of its raw and digested sludge. Sludge is pumped to the process at a pressure of approximately 300 psi and is passed through a heat exchanger and heated to a temperature of 300 deg F by the outgoing oxidized sludge before entering the reactor. A reactor outlet temperature of 340-350 deg F is obtained either from heat given off by the oxidation or by steam injected into the system. Odors are completely removed by passing the gases through a catalytic combustion unit at temperatures of 650-750 deg F. The oxidized sludge is then vacuum filtered without chemical additives. Typical sludge characteristics, operating performance and filtration data are presented in tabular form. Capital costs were approximately $200,000 and operating costs were itemized. An operating cost of $11.10 per ton of dry solids at an operating rate of 3.65 tons per day is reported. (Galwardi-Texas)

SOLIDS DON'T GO TO WASTE AT WYETH,
Wyeth Labs., Philadelphia, Pa.
John A. Moffett.
Water and Sewage Works, Vol 117, No 3, p 4-5, March 1970. 5 fig.

Descriptors: *Waste water treatment, *Pre-treatment, Centrifugation, Performance, Activated sludge, Treatment facilities, Sludge treatment, Sludge disposal, Biochemical oxygen demand, Pennsylvania, *Solid wastes.
Identifiers: Westchester (Pennsylvania).

Pretreatment of 140,000 gpd is provided by Wyeth Laboratories before discharge into Westchester's sanitation plant. The treatment facilities consist of an equalization tank, activated sludge aeration units and clarifiers with heli-thickeners, and a centrifuge. Before installation of the centrifuge, excess solids either had to be raked off from the surface of the aeration tanks, or simply ended up in the plant's effluent. BOD removal of 90-95% is provided by the plant. The centrifuge provides a solids handling system and also regulates the solids content of the aeration tanks. A model P-3400 Sharples centrifuge is used for a period of one week in every 3 months. Input conditions to the centrifuge range from 24 to 31% suspended solids, by volume, with a 15 to 20 gpm feed rate. The solids content of the liquid effluent has been reduced to 0.5 to 7.0% and the moisture content of the cake is 95 to 96%. (Galwardi-Texas)

CANADA'S LARGEST SLUDGE INCINERATORS FIRED UP AND RUNNING.
Department of Works, Toronto (Ontario).

Water and Pollution Control, Vol 107, No 1, p 20-24, January 1969. 4 fig, 1 tab.

Descriptors: *Sludge treatment, *Sludge disposal, *Costs, *Incineration, Performance, Air pollution, Waste water treatment.
Identifiers: Multiple hearth furnaces, Air pollution control, Toronto (Canada).

Three multi-hearth sewage sludge incinerators rated at a combined capacity of 134 dry tons per

day were installed at the Main Treatment Plant at Ashbridges Bay in Toronto. The multiple-hearth furnaces are cylindrical, refractory-lined steel shells containing a series of horizontal refractory hearths located one above the other. Combustion takes place in an enclosed environment as the furnace is divided into three distinct zones of drying, combustion and cooling. Combustion temperatures are between 1400 and 1600 deg F. The loading rate in lbs/hr of filter cake to each furnace can reach 23,900 based on a moisture content of 80%. Residual inorganic ash is pumped as a slurry to a near-by lagoon. Tests of the liquid overflow show that it has a BOD of only 2 to 3 ppm. Each incinerator is equipped with a flue-gas scrubber system. This complies to a code which calls for a discharge of not more than 0.30 lb of dust per 1000 pounds of gas adjusted to 12% CO2. The incinerators were installed at a total contract price of 3.8 million dollars. (Galwardi-Texas)

THE NON-CHEMISTRY OF CHEMICAL TREATMENT,
McMaster Univ., Hamilton (Ontario). Dept. of Chemical Engineering.
Jack Norman.
Water and Pollution Control, Vol 107, No 3, p 18-20, March 1969. 1 fig.

Descriptors: *Water treatment, *Waste water treatment, *Chemistry, Chemical precipitation, Coagulation, Hydrogen ion concentration, Disinfection, Water softening, Chemical reactions.

Chemical treatment is practiced in almost all water and waste water treatment plants, yet its action is neither predictable nor understood in many cases. A review of various categories of attitudes that exist toward chemical treatment of water and waste water is presented. The measure of success that is used in evaluating the usefulness of some particular chemical in producing reactions in water and the lack of knowledge and lack of understanding of the chemical reaction processes occurring during the use of these chemicals are pointed out for four applications. The applications covered are the coagulation, disinfection, water softening and pH control processes. (Galwardi-Texas)
W70-08403

CONTACT STABILIZATION PROCESS CHOSEN FOR NEW DYRDEN PLANT.
Water and Pollution Control, Vol 107, No 4, p 32-33, April 1969. 2 fig.

Descriptors: *Waste water treatment, *Facilities, *Costs, *Capitol costs, Sewers, *Domestic wastes, *Municipal wastes.
Identifiers: *Contact stabilization process, Dryden, Ontario (Canada).

The contact stabilization process was chosen for the Dryden, Ontario, waste water treatment plant because the waste was predominantly domestic sewage. The plant was designed for a daily capacity of 1 mgd and a maximum capacity of 2.5 mgd with a 90% removal rate. The plant consists of a 30-foot pump station, a 10-foot diameter Dorr-Oliver-Long detritor unit, and 18-inch Chicago Pump Model C barminutor, two 500,000 gpd Smith and Lovless Oxigest biological treatment units, and a 12-foot by 30-foot chlorine contact chamber. The contact stabilization process has the two-fold advantage of reducing the size of the biological treatment units, and reducing the cost of the installation. The use of steel tanks for the biological treatment units reflected the high cost of concrete work in Northern Ontario. The total cost of the project was $1.3 million, with the trunk collector sewers costing $675,000, the pumping station $85,000 and the treatment plant $553,000. (Galwardi-Texas)
W70-08404

OZONE TREATS WASTESTREAMS FROM POLYMER PLANT,
Texas Univ., Austin. Dept. of Civil Engineering.
William W. Kwie.
Water and Sewage Works, Vol 116, No 2, February 1969, p 74-78. 3 fig, 2 tab, 15 ref.

Descriptors: *Ozone, *Organic wastes, *Biodegradation, *Waste water treatment, Oxidation, Effluent streams.
Identifiers: *Unsaturated organics, Sodium alkyl napthalene sulfonate, *Polymer plants, Waste streams.

Ozone is used to treat three separate waste streams from a polymer plant, each of which is normally resistant to biodegradation. The first stream is extremely high in chlorides, the second contains unsaturated organic compounds, and the third contains both unsaturated organic compounds and solium 8-alkyl naphthalene sulfonate-2 (SANS). The ozone reacts readily with the unsaturated organics and the naphthalene moiety of SANS. A dosage of 5400 mg/l ozone in the first stream resulted in a COD reduction of 90%. Although the naphthalene moiety of the SANS is removed by ozonation, the resulting compound proved to be no more adaptable to biodegradation than the untreated SANS. It is speculated that a culture of specially acclimated microorganisms might be developed to treat the SANS fraction. (Makela-Texas)

ORGANIC COMPOUNDS REMOVED BY REVERSE OSMOSIS,
Washington State Univ., Pullman. Dept. of Sanitary Engineering.
Ervin Hindin, Paul J. Bennett, and Shyamela S. Narayanan.
Water and Sewage Works, Vol 116, No 12, p 466-470, December 1969. 4 tab, 14 ref.

Descriptors: *Reverse Osmosis, *Membrane processes, *Organic compounds, Tertiary treatment, *Pesticide removal, Oil wastes, Waste water treatment, DDT, Alkylbenzene sulfonates, Linear alkylate sulfonates, *Sulfonates.
Identifiers: *Cellulose acetate membranes, Lindane, TDE (DDD).

The permeation of over 30 specific chemical species through a laboratory-scale reverse osmosis unit employing cellulose acetate membranes was determined. Chemical species investigated were those most commonly found in treated waste water effluents. Initially, the individual species in an aqueous solution or dispersion was investigated and then mistures were investigated to determine the presence of synergistic or antagonistic actions of one species toward another. Reductions of 80 to 99% were obtained for those chemical species existing primarily in the colloidal, aggregate, unicell or macromolecular form. When the species was partially in true solution and when the vapor pressure of the discrete molecule in true solution was appreciably greater than that of water, reductions of 50 to 80% were obtained. When the discrete molecules were more volatile than water, reductions were between 14 and 40%. Typical reductions for selected single chemical species are: ABS-94.0%; LAS-97.2%, Motor oil>99.7%; DDT>97.3%; Cellulose-61%; Acetone-47%. Mixtures of most of these species showed marked reductions in these results due to antagonistic as well as synergistic effects at the membrane surface. Finally secondary treatment plant effluents were applied to the system and when specific species were not present, they were added. Comparison of these results with those from single species and mixture studies indicated more effective removals were obtained for most all compounds. (Sorber-Texas)

CHEMICAL FEED SYSTEMS DETERMINE PLANT EFFICIENCY AND RELIABILITY,
Wallace and Tiernan, Inc., Belleville, N.J.
Robert J. Baker.
Water and Sewage Works, Vol 116, No 6, p 214-217, June 1969. 1 fig.

Descriptors: *Waste water treatment, *Design, Equipment, *Chemicals, *Flexibility control systems, Instrumentation, Storage capacity.
Identifiers: *Chemical feed systems, Capacity.

The application, design, and control of chemical feed systems for water treatment plants is considered. The typical chemical feed system is defined as consisting of chemical storage, preparation for feeding, feeding, preparation for application, application to the process, and related process and system controls. Each of these basic elements is discussed in regards to its importance and position within the chemical feed system. In the design of a chemical feed system seven factors are suggested for consideration: chemical selection, capacity, type of control, flexibility, future requirements, standby equipment and the need for instrumentation. Advance planning for alternatives can provide flexibility for the most suitable chemical for the process and the most economical plant operating costs. Further, variation or changes in process operation can be best accommodated if chemical alternatives are considered during design. Capacity is discussed from two view points: storage and equipment metering ranges both of which can have considerable bearing on the flexibility and workability of the system as a whole. Manual, flow proportional, and feedback from process controls are discussed. Combinations of these on the compound-loop control system is suggested to be the more flexible under most conditions. Overall system flexibility is obtained by selecting equipment with a maximum of alternate uses. This type design will be readily adaptable to future requirements as well as satisfy some requirements for standby equipment. (Sorber-Texas)

A SUGGESTED FORMULA FOR THE PROCESS OF BIOLOGICAL FILTRATION,
Water Pollution Research Lab., Stevenage (England).
R. Lamb, and S. G. H. Owen.
Water Pollution Control, Vol 69, p 209-220, 1970. 14 fig, 9 tab, 14 ref.

Descriptors: *Formulation, *Mathematical models, *Trickling filters, Biodegradation, Design, Filters, Hydraulic properties, Kinetics, Organic loading, Temperature, *Biological treatment.
Identifiers: *Biological filtration, Specific surface area.

An equation has been developed from theoretical considerations which relates the strength of the influent and effluent of a biological filter to the flow of sewage, volume of medium, the specific surface area of the medium, and the temperature of the sewage. Good agreement with the equation has been found with various published data from both England and the USA using both conventional and plastic media. It is hoped that the formula: (BOD sub E)/ ((BOD sub 1)- (BOD sub E)) - F x 0.039e exp. (-0.09 (T-15))/VS has been proved sufficiently to be accepted as the basic equation for biological filtration. It is suggested that for design, a minimum temperature of 8 deg C be assumed. When this is substituted in the right-hand side of the equation the latter becomes F x 0.078/VS. Also the constants have been derived from average values and it is recommended that when designing a filter to produce an effluent always having a BOD of less than 20 mg/l that calculations be made using a BOD sub E of 15 mg/l. This will be produced during all seasons of the year. (Aguirre-Texas)

CENT STUDIES OF HIGH-RATE BIOLOGI- L FILTRATION,
ter Pollution Research Lab., Stevenage (En- nd).
M. Bruce, and J. C. Merkens.
ter Pollution Control, Vol 69, p 113-148, 1970. ig, 12 tab, 49 ref.

scriptors: Flow rates, Organic loading, *Trick- filters, Biodegradation, Filters, Waste water atment, *Biological treatment, Sewage treat- nt.
ntifiers: *Biological filtration.

estigation was made of performance of a tower er, 7.1 m deep, containing Surfpac medium, en treating domestic sewage at high rates. sults showed that the average BOD removals ieved at hydraulic loadings between 6 and 18 m)/ (sq m)d were very similar to those obtained earlier studies with a filter of 2.1 m depth. The ximum rate of BOD removal was about 1.5 Kg/ m)d. An experiment to determine lateral dis- ution of liquid within the tower indicated that even surface distribution is probably more im- tant in order to achieve full utilization of the dium than is the actual rate of application. sults from a study to compare the efficiencies of ious types of media for high-rate treatment of nestic sewage, indicate that performance is re- d in a general way to specific surface area of the dium but the actual physical configuration of medium also influences performance. The rage performances of the various filters, in ms of BOD removals, were closely related to uid retention time characteristics. BOD removal iciencies ranged from 32.8 to 77.5% for the vari- filters. E IMPORTANCE OF ZETA POTENTIAL TO E WATER INDUSTRY,
iversidad Nacional Autonoma de Mexico, Mex- City. Instituto de Geofisica.
ul A. Deju.
ter and Sewage Works, Vol 116, No 12, p 460- 4, Dec 1969. 6 fig, 1 tab, 21 ref.

scriptors: *Zeta potential, *Waste treatment, aste water treatment, *Instrumentation, *Elec- phoresis, Colloids, Industrial wastes.
ntifiers: *Electrophoretic mobility, Moving- undary cell, Mass-transport cell, Microelec- phoresis.

e theoretical considerations and applications of a potential to the water and waste water industry discussed. Zeta potential is defined as the arge of a particle at the periphery of its Stern er and for aqueous solutions it is determined by asurement of electrophoretic mobility. Instru- nts available for measurement of elec- phoretic mobility include various microelec- phoresis cells and the Long-Ross, mass-trans- rt cell with associated power supplies and optics. Both types of instruments are described in detail. A modified microelectrophoresis apparatus suited to dilute solutions which can be employed rapidly, requires only small amounts of solution and requires no microscopic examinations is described in detail. Although the conducting unit and power supply are similar to earlier microelectrophoresis instruments, this version employs a projection and lens-filter system permitting the projections of images of the particles on a screen for rapid easy electrophoretic mobility determinations. General applications of zeta potential to the water and waste water industries are discussed including: colloid precipitation and/or dispersion, control of flocculating agent dosage, alkylbenzene sulfate or detergency control in water and waste water treatment operations and identification of the nature of the surface of living bacteria. There are other uses of zeta potential in the water industry and its uses in waste water treatment and disposal are considered enormous. (Sorber-Texas)

DYNAMICS OF MICROBIAL PROCESS,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
H. R. Bungay, and J. F. Andrews.
Water and Sewage Works, Vol 117, No 3, p 77-80, Mar 1970. 1 fig, 9 ref.

Descriptors: *Biological treatment, *Efficiencies, *Waste treatment, *Effluents, *Analog computers, Digital computers, Methane, Biological communities, Aerobic treatment, Anaerobic treatment, Anaerobic digestion, Waste water treatment.
Identifiers: Effluent quality, Methane production.

Although many processes are available for the improvement of effluent quality, the operation of biological waste treatment process at or near peak efficiencies provides considerable economic promise. Process control for biological treatment plants has many possibilities as well as several pitfalls due to the dynamics involved. Currently, some of the indices which can be monitored rapidly (e.g. flow rate, pH, temperature and DO) do not permit complete process control. Others such as BOD take considerable time for assay and its value as a short-term process control is limited. This problem is further complicated by sampling techniques commonly employed. Examples of control processes now in use are discussed. However, most control systems are of the feed-back type from the final effluent stream. In these cases it is often too late to correct a mistake in a biological system. Feed forward control is necessarily applied to systems with either very short or very long response times. Feed-forward control presupposes sufficient understanding of the system to predict the effects of the input notables. When applied to a biological treatment system this means a model of reasonable accuracy must be available. The Monod equation could be helpful in a control system based on population dynamics and nutrient concentration. Long-term projects to provide adequate workable process controls for anaerobic digestors and a forward-feed control system for a conventional waste treatment plant are discussed. Parameters for the digestor include methane production, temperature, pressure and flow rate. (Sorber-Texas)

NEW PLANT CONTROLS POLLUTION AT WELLAND.

Water and Sewage Works, Vol 116, No 11, p 434-435, Nov 1969. 3 fig.

Descriptors: *Waste water treatment, *Treatment facilities, *Costs, *Design criteria, Vacuum drying, Sludge digestion, Chlorination, Performance, Industrial wastes, Domestic wastes, Aeration.
Identifiers: *Primary treatment, Preaeration, Primary settling tanks, Welland, Ontario (Canada).

Domestic and industrial wastes which once polluted the Welland River in Ontario are now being treated at Welland's new primary treatment plant. The plant has an average capacity of 8 mgd with a peak design flow of 20 mgd. Design criteria provides for removal of 95% of grit, 70% of settleable solids and 30% of the BOD. The effluent is disinfected with chlorine and discharged to the river, while the sludge is digested, thickened and vacuum filtered. The plant was designed for future expansion to secondary treatment and a design population of 80,000. The plant features a 75 ft. lift station, a 40 in. Barminutor, a 26 ft square detritor, pre-aeration tanks with a total capacity of 190,000 gal for a detention period of 34 min; four primary settling tanks which provide a detention time of two hours; primary and secondary digesters, a vacuum filter and chlorination equipment. The treatment facility cost $2.35 million and a connecting trunk sewer system cost an additional $5.5 million. (Galwardi-Texas)

EFFECT OF ORGANIC COMPOUNDS ON PHOTOSYNTHETIC OXYGENATION--I. CHLOROPHYLL DESTRUCTION AND SUPPRESSION OF PHOTOSYNTHETIC OXYGEN PRODUCTION,
Texas Univ., Austin. Environmental Health Engineering Research Lab.
Ju-Chang Huang, and Earnest F. Gloyna.
Water Research, Vol 2, p 347-366, 1968. 28 fig, 3 tab, 19 ref.

Descriptors: *Algae, *Chlorophyll, Water pollution effects, *Organic compounds, *Oxygenation, *Photosynthesis, Chlorella, Pesticides, Pesticide toxicity, Photosynthetic oxygen, Productivity, *Waste water treatment.
Identifiers: *Chlorella pyrenoidosa.

This paper describes the inhibition of chlorophyll synthesis and the destruction of chlorophyll in Chlorella pyrenoidosa due to the presence of selected organic compounds. Emphasis is directed toward an explanation of laboratory techniques and an evaluation of changes in photosynthetic oxygen production due to the addition of selected compounds. Changes in extractable chlorophyll concentrations are presented in terms of exposure time and concentration of chemical additives. Selected algal cultures were grown for a test period of 72 hours in test tubes under constant temperature conditions, with continuous illumination, and under controlled nutrient supplies. Under such conditions the chlorophyll content decreases markedly in relation to the concentration of the organic additive. For the compounds evaluated, the chlorophyll reduction seems to be a function of the substituted groups and their relative positions. Also, a direct manometric technique is described for measurement of photosynthetic gas exchange. Results show that oxygen production is suppressed by chlorinated and nitrated phenols. EFFECT OF ORGANIC COMPOUNDS ON PHOTOSYNTHETIC OXYGENATION--II. DESIGN MODIFICATION FOR WASTE STABILIZATION PONDS,
Texas Univ., Austin. Environmental Health Engineering Research Lab.
Ju-Chang Huang, and Earnest F. Gloyna.
Water Research, Vol 2, p 459-469, 1968. 6 fig, 2 tab, 7 ref.

Descriptors: *Design, Water pollution effects, *Organic compounds, *Oxidation lagoons, *Photosynthetic oxygen, Design criteria, Efficiencies, Laboratory tests, Lagoons, Ponds, *Waste water treatment, *Oxygenation.

The potential suppression of dissolved oxygen in ponds and streams due to decreases in photosynthetic oxygenation is described. Studies involving laboratory waste stabilization ponds, operated under controlled conditions, substantiate the predicted decrease in dissolved oxygen and

treatment efficiency. Designs for waste stabilization ponds can be improved by incorporating a chlorophyll loss factor into commonly used design equations. Toxic compounds present in waste streams may affect the operation of waste stabilization ponds in at least four ways. (a) Compounds may inhibit the photosynthetic processes and hence suppress photosynthetic oxygenation. (b) Toxic compounds may inhibit bacterial activity, and reduce the rate of biodegradation of organic compounds. (c) The biodynamic equilibrium of biological populations in the pond may be upset by the presence of certain toxic compounds. (d) Some industrial wastes are toxic and relatively resistant to biodegradation. These compounds may impose an appreciable COD concentration of the effluents. For most of the compounds reported herein, a chlorophyll compensation factor may be expressed. This may be incorporated into the general design equation for waste stabilization ponds. The design standards of waste stabilization ponds can be improved by adding a chlorophyll compensation factor to the developed design equation. (See also W70-08416). (Aguirre-Texas)

APPLICATION OF REVERSE OSMOSIS TO WASTE STREAMS IN CORN PROCESSING INDUSTRY, PART 1,
Ontario Research Foundation, Toronto.
F. K. Besik.
Water and Pollution Control, Vol 107, No 10, p 24-26, Oct 1969. 1 tab, 3 fig.

Descriptors: *Reverse osmosis, *Industrial wastes, *Membrane processes, Chemical oxygen demand, Biochemical oxygen demand, Carbohydrates, Efficiencies, Tertiary treatment, Water reuse, Membranes, Waste water treatment, Effluent streams.
Identifiers: *Cellulose acetate membranes, *Corn processing, Rejection ratios, *Starch industry, Flux rates, Membrane rejections, Waste streams.

The potential and reported uses of the reverse osmosis (RO) process are discussed as they apply to the starch industry, to other industries and to water reclamation. Problems such as membrane fouling and aging are addressed in light of optimum velocities, concentration polarization on the membrane surface and membrane advances. A tube-type pilot reverse osmosis unit was applied to starch wash water and the quality of its performance was judged by the determination of feed and product water total solids, total carbohydrates, COD and BOD. Three different grade membranes rated at 8, 13, and 20 gal/sq ft/day on the basis of 5000 mg/l NaCl at 800 psi were used. BOD and COD rejections were in the range of 99.5 and 97.0% and decreased with increasing membrane permeability. Total dissolved solids rejections ranged between 96 and 75% and also decreased with increasing membrane permeability. Total carbohydrate rejection removed approximately the same for all membranes at 99.5%. During the investigation it was observed that rejection appeared to be independent of initial concentration in the range investigated (0-90 g/l) and that rejection increased with an inverse in operating pressure (400-800 psi). As a result of this study it was concluded that adequate information had been obtained for a preliminary plant design for starch wash water but considerably more detail was required before final application of the design could be made. (See also W70-08419). (Sorber-Texas)

REVERSE OSMOSIS TREATMENT FOR CORN PROCESSING EFFLUENT--PART 2,
Ontario Research Foundation, Toronto.
F. K. Besik.
Water and Pollution Control, Vol 107, No 11, p 47-49, Nov 1969. 10 fig, 18 ref.

Descriptors: *Reverse osmosis, *Industrial wastes, *Membrane processes, Temperature, Pressure, Aging (Physical), Tertiary treatment, Water reuse, Membranes, Waste water treatment, *Effluents
Identifiers: *Starch industry, Flux rates, Permeation constant, Membrane rejection, Corn wastes.

Specific investigations into the interrelationships between pressure drops, various flux rates for tap water and starch wash water, temperature, membrane aging, and the effect of concentration on flux rates were conducted and are discussed in detail. These parameters were considered in order to complete the design of an operating full-scale reverse osmosis system for starch wash water in a corn processing plant. It was concluded that operating pressure had no effect on the permeation constant. It was further concluded that, within the pressure limits of 400-900 psi, compression effects can be neglected for the membranes used. Flux rate was found to be linearly proportional to temperature between 10 and 35 deg C for both tap water and starch wash water and, consequently, it is desirable to operate at the highest temperatures allowed for the equipment and process employed. Flux rate decreased rapidly for increasing concentrations at low or high operating pressures. Concentrations of starch wash water ranged from 1 to 90 g/l and operating pressures from 100 - 800 psi. Short-term aging studies were also conducted (up to 100 hours operating time). Minor decreases in permeation constant were observed to occur with time but a general conclusion was not made due to the relatively short operating periods. Further, increasing the concentration of dissolved matter in the feed water results in an increase in solution osmotic pressure and a decrease in flux rate. (See also W70-08418). (Sorber-Texas)

FILTRATION AND MICROSTRAINING OF SECONDARY EFFLUENT,
Metropolitan Sanitary District of Greater Chicago, Ill.
Vinton W. Bacon, and Bart T. Lynam.
A paper presented at the University of Texas Conference on Advances in Water Quality Improvement, April 1, 1969. Metropolitan Sanitary District of Greater Chicago, Chicago, Ill., April 1, 1969. 41 p, 24 fig, 1 tab, 11 ref.

Descriptors: *Filtration, *Tertiary treatment, *Waste water treatment, *Water purification, *Municipal wastes, *Water reuse, Biochemical oxygen demand, Sewage treatment, Cost comparisons.
Identifiers: *Microstrainers, *Hardinge sand filter, *Suspended solids removal, Metropolitan Sanitary District of Greater Chicago, Hanover Treatment Plant.

This paper presents comparisons of efficiencies and costs of removing suspended solids, and associated BOD, from the activated sludge effluent of the Hanover Sewage Treatment Plant using both continuous rapid-sand filtration and microstraining. This is the first permanent installation of a microstrainer in a tertiary wastewater treatment plant in the United States. The sand filters are of the Hardinge type. The microstrainer is a drum 10 feet in diameter by 10 feet long covered with a stainless steel microfabric having 160,000 openings per square inch. The drum speed and backwash pressure are automatically controlled by the head loss across the drum. It was found that a rational approach for the analysis of data, relative to the performance of filtration devices in treating secondary, activated sludge effluents for removal of suspended solids, would be to consider removal as a function of suspended solids loading in terms of pounds per square foot per day. This takes into account the parameter of hydraulic loading in terms of gpm per square foot, solids input, and the resultant input from the filtration process. The costs of sand filtration and microstraining appear comparable. (Poertner)

INVESTIGATION OF THE FEASIBILITY OF PURIFYING MUNICIPAL WASTE WATER BY DISTILLATION,
Oak Ridge National Lab., Tenn.
I. Spiewak.
Oak Ridge National Laboratory Report ORNL-TM-2547, Oak Ridge, Tennessee, April 1969. 43 p, 9 fig, 7 ref. HUD Interagency Agreement No. IAA-H-3-69.

Descriptors: *Distillation, *Municipal wastes, *Waste water treatment, *Water reuse, *Municipal water, *Water supply, *Water utilization, *Water purification, *Demineralization, Flash distillation, Long tube vertical distillation, Tertiary treatment, Ion exchange, Reverse osmosis, Freezing, Electrodialysis, Nuclear powerplants, Nuclear reactors, Cost comparisons.
Identifiers: *Waste heat utilization.

The report focuses upon the technical and economic feasibility of applying the distillation process for demineralization of municipal waste waters. Principal applications of the method would be for improving the quality of effluents released from treatment plants to receiving streams, and to supplement water supply requirements in urban communities. This investigation is one of a series sponsored by HUD to determine the feasibility of nuclear power plants for the provision of low cost thermal energy to urban areas. Distillation has two potential roles in municipal waste treatment, one as a means of purifying waste water for reuse and second as a step in the ultimate disposal of solids. The technical problems of waste water distillation, described in the literature, are summarized. Cost estimates are given for a number of possible systems using distillation to treat effluent from a city of 1 million population. The analysis indicates that, although advanced waste treatments may increase the cost of sewage processing by factors of up to four times, the overall cost of water supply and treatment need not be increased over about 50%. Distillation appears to be a promising method of waste treatment, although methods of controlling tube fouling and distillate quality remain to be developed. Electrodialysis, reverse osmosis, freezing and ion-exchange are also discussed. (Poertner)

TERTIARY TREATMENT AT METRO CHICAGO BY MEANS OF RAPID SAND FILTRATION AND MICRO-STRAINERS,
Metropolitan Sanitary District of Greater Chicago, Ill.
Bart Lynam, Gregory Ettelt, and Timothy McAloon.
This report of a study, supported in part by a grant from the FWPCA, was presented at the Annual Conference of the Water Pollution Control Federation, September 26, 1968. Metropolitan Sanitary District of Greater Chicago, September 26, 1968. 86 p, 36 fig, 9 tab, 8 ref.

Descriptors: *Tertiary treatment, *Filtration, *Waste water treatment, *Water purification, *Municipal wastes, *Water reuse, Coagulation, Flocculation, Disinfection, Aeration, Water quality control, Municipal water, Treatment facilities.
Identifiers: *Microstrainers, *Rapid sand filtration, Hanover Plant, Metropolitan Sanitary District of Greater Chicago.

The report is a description and evaluation of the design and five month's operating experience at the District's only tertiary waste water treatment facility. It was put into service in 1968 at the Hanover Plant. The facility treats the entire effluent from the secondary, activated sludge, treatment stage, averaging 1.5 mgd of domestic sewage. The basic objectives of the project were to: (1) produce effluent improvements in BOD, suspended solids, disinfection and dissolved oxygen; (2) provide the District with a research and development installa-

n for advanced treatment investigations; and (3) velop design criteria for future tertiary facilities. e tertiary facility consists of chemical clarifica- n and physical separation by filtering using rdinge filters, or by straining. The straining uses Glenfield-Kennedy micro-strainer with auto- tic control. It is the first permanent installation the United States for tertiary treatment. The ility was designed for eight different modes of eration to investigate various treatment com- nations. It was found optimum suspended solids noval was obtained by alum and polymer coagu- ion in combination with sand filtration. Both the cro-strainer and sand filter produced an effluent th suspended solids below the 5 mg/l criteria. nd filtration, with chlorination within the basin, d microstraining after chlorination by contact sin both produced effluents below the 4 mg/l teria for BOD. entifiers: *Waste water reclamation, Waste water e.

ew water treatment processes are needed for eanup and reuse of water to meet future industri- and municipal water demands. Conventional ater and waste treatment processes are only par- ally effective against the expanding list of com- ounds contaminating the lakes and rivers. An valuation of 9 tertiary treatment research and evelopment projects shows that the costs of moving organic and inorganic nutrients range om 26 to 30 cents per 1000 gal compared to 11 ents per 1000 gal for secondary treatment. How- ver, waste water reclaimed by tertiary treatment as a higher economic value, offsetting the higher ost of tertiary treatment. Results of field and boratory studies are reviewed on the use of everse osmosis for reclaiming brackish water, acid ine drainage, saline irrigation return flow, paper ill waste effluents, agricultural runoff, and mu- icipal waste water. Problems remaining include: 1) creating tailormade membranes for retention r passage of specific materials, (2) preventing embrane fouling by organics and other trace con- aminants, and (3) preventing flux decline or estoration of flux. 5E. Ultimate Disposal of Wastes

LTIMATE SLUDGE DISPOSAL AND SOIL IM- ROVEMENT,
orest Service (USDA), Washington, D.C.
ames O. Evans.
Vater and Wastes Engineering, Vol 6, No 6, June 969, p 45-47. 1 tab, 10 ref.

Descriptors: *Sludge disposal, *Sludge treatment, Nutrients, Nutrient requirements, Sewage sludge, Waste water treatment, *Soil disposal fields, Pennsylvania, Soil treatment.

The value of liquid digested sludge as an agricul- ural asset is discussed in relation to the economics of sludge disposal on farm land, disease transmittal, nd public acceptance of sludge disposal on land. Unthickened sludge contains 2-5% solids. The water portion of the sludge is a supplemental irriga- ion source, and both water and solids contain key nutrients and elements necessary for plant growth. The organic material forms humus, a soil conditioning substance. Sludges applied to farm land in three Pennsylvania communities resulted in higher crop yields and requests for more sludge than was available. The costs of sludge disposal on farm land depends on method of surface spreading, transport distance, mode of transport, and transport efficiency. It may be economical to pump sludge by pipeline up to 100 miles. Disease transmitting microorganisms seem to have a greater longevity in sludge treated soils. Under favorable conditions, the more common intestinal pathogenic organisms might survive up to one year. More research needs to be done in this area. Public acceptance is dependent on aesthetics, economics, and public relations. Sludge disposal on land is gaining gavor in England, where much of the current research on the subject is being done. CHEMICAL REMOVAL OF NITRATE FROM POTABLE WATER SUPPLIES,
Kansas Water Resources Research Inst., Manhattan.
Walter J. O'Brien.
Available from the Clearinghouse as PB-193 023, $3.00 in paper copy, $0.65 in microfiche. Kansas State University Water Resources Research Institute Completion Report, Contribution No 23, June 1968. 87 p, 14 fig, 34 tab, 32 ref. OWRR Proj No A-010-KAN.

Descriptors: *Water treatment, *Nitrates, Ion exchange, Ammonia, Costs, Desalination, Water purification, Potable water, Chemical precipitation, Water chemistry.
Identifiers: Nitrate removal.

Removal of nitrate ion from potable waters by chemical reduction at alkaline pH followed by air stripping, and anion exchange using intermediate base and type one strong base resins were investigated. Nitrate reduction to ammonia by ferrous ion at room temperature in the pH range 10 to 11.5 was found to be technically feasible. The process is impractical from an engineering viewpoint, however, because chemical costs for ferrous salts and for pH control are prohibitive and because excessive concentrations of chloride or sulfate are present in the finished water. The intermediate base anion exchange resins tested, when operated on the hydroxide cycle, showed little promise. The strong base type one anion exchange resins tested, when operated on the chloride cycle, showed considerable promise. (Knapp-USGS)

5G. Water Quality Control

SULFIDE TO SULFATE REACTION MECHANISM--A STUDY OF THE SULFIDE TO SULFATE REACTION MECHANISM AS IT RELATES TO THE FORMATION OF ACID MINE WATERS.
Ohio State Univ. Research Foundation, Columbus.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 - Price $1.50. Water Pollution Control Research Series, February 1970. 115 p, 20 tab, 37 fig, 27 ref, 5 append. FWQA Program 14010 FPS---2/70.

Descriptors: *Mine drainage, *Coal mine wastes, *Sulfates, *Chemical reactions, *Acid mine water, *Oxidation, *Sulfides, Pyrite Ferrobacillus, Pollution abatement, Industrial wastes, Water pollution control, Oxygenation.
Identifiers: Coal mine drainage, *Reaction kinetics, Iron sulfides.

A detailed study of the mechanisms and kinetics of the chemical reactions responsible for acid mine drainage has been made. The mineralogical features of the solid phase reactant (pyrite) that determine its reactivity were described. The rate-limiting reactions and variables affecting the rate of these reactions were identified. It was found that two basic oxidation modes are important: oxygenation, in which oxygen is the immediate oxidizing agent; and ferric ion (or microbiologically catalyzed) oxidation, in which ferric ions are the oxidants. From a knowledge of the dissolved oxygen, ferric/ferrous ratio, and total iron ion content at the reaction site, the reaction regime can be determined. Kinetic equations were derived for both reaction modes. From these basic relationships the oxidation rate in real pyritic systems can be accurately predicted when conditions at the reaction site are known. For a given pyrite surface, oxygenation rate is, for all practical purposes, dependent only on the oxygen concentration in the aqueous phase surrounding the reactive site on the pyrite surface. Ferric ion oxidation rate is determined by the ferric/ferrous ratio and free ferric ion concentration in solution, and is not affected by dissolved oxygen. In a real system, the ferric/ferrous ratio is determined by a 'relative' microbial activity; i.e, the number of bacteria per exposed pyrite surface. Bacterial activity is limited by pH and oxygen concentration as well as nutrient levels.

AQUATIC PLANT CHEMISTRY. ITS APPLICATION TO WATER POLLUTION CONTROL,
State Univ. of New York, Syracuse. Coll. of Forestry.
Robert T. LaLonde.
Available from the Clearinghouse as PB-192 810, $3.00 in paper copy, $0.65 in microfiche. Water Quality Research Series Report. July 1970. 40 p, 7 tab, 1 fig, 26 ref. FWQA Project 16020DHVO---7/70. FWQA Contract 921141.

Descriptors: *Bacteria, *Antibiotics, *Chemistry, *Rooted aquatic plants, Aquatic bacteria, Hydrophytes, Chemical properties, Chemical analysis, Ecology.
Identifiers: *Alkaloids, *Nuphar, Nuphar alkaloids, Chemical ecology.

Possibly aquatic plants can play a role in aquatic ecology through the production and release of biologically active agents. The research objective was to determine the presence, chemical nature and biological activity of plant-produced agents. Nuphar luteum subsp. variegatum and macrophyllum produce both C-15 alkaloids and C-30, sulfur-containing alkaloids. Two of the latter type were isolated. Both were determined as stereoisomeric biscarbinolamines incorporated into two deoxynupharidine moieties linked together at C-7 through a thiaspirane ring. Two new C-15 alkaloids, 7-epideoxynupharidine and 3-epinuphamine, were discovered in N. luteum subsp. variegatum. Both C-30, sulfur-containing alkaloids were active against Corynebacterium michiganese. The more abundant of the two C-30 alkaloids was tested further against five additional phytopathogenic bacteria and was active against four of these. The same alkaloid was inactive against three bacteria taken from the site where the plant material was harvested. C-15 alkaloids, nupharidine and deoxynupharidine, were inactive against C.

michiganense, the bacteria most sensitive to the sulfur-containing alkaloids. There is now sufficient indication that Nuphar produces agents which are active against some phytopathogenic bacteria. The extent of the release of Nuphar-produced agents into the surrounding aquatic environment should be studied.

JERSEY CITY V STATE WATER POLICY COMM'N (JURISDICTION OVER WATER PURITY).

191 A 456-459 (NJ Ct Err and App 1937).

Descriptors: *New Jersey, *Legislation, *Administrative agencies, *Administrative decisions, Potable water, Water quality, Public health, Percolating water, Subsurface waters, Adjudication procedure, Judicial decisions, Marshes, Evaporation, Water storage, Dams, Legal aspects, Regulation, Permits, Jurisdiction.

Plaintiff city sought review of defendant Water Policy Commission's authorization for dam construction. Plaintiff contended that such construction would endanger the purity of the public water supply and thereby constitute a hazard to public health. Defendant argued that the question of public health was not within the scope of its jurisdiction and that such questions had to be answered by the State Board of Health. The Court of Errors and Appeals of New Jersey, construing the statute creating defendant Commission, reasoned that defendant was invested with broad comprehensive powers over water management. Although the Board of Health had jurisdiction over sanitary water conditions, the court reasoned that it would be a frustration of legislative intent to say that defendant was without interest in this area. The court ruled that defendant must reconsider its decision to grant the permit, this time taking the potability of the water into consideration. (Barker-Florida)

EVALUATION OF POTENTIAL ACID MINE DRAINAGE,
Carnegie-Mellon University, Pittsburgh, Pa.
Robert A. Baker, and Albert G. Wilshire.
Water and Sewage Works, Vol 117, No 6, p IW/10, 12, 14, 16, June 1970. 4 p, 2 fig, 3 tab, 13 ref. FWQA Contract 14010 DKN F.

Descriptors: *Acid mine water, *Water pollution control, *Laboratory tests, Pilot plants, Leaching, Iron bacteria, Sulfur bacteria, Chemical reactions, Water chemistry, Acidic water, Acid streams, Biochemistry
Identifiers: Acid mine drainage control

Oxidation of iron pyrite, FeS2, exposed during coal mining results in release of acidity and ferrous iron which imposes a major pollutional loading on receiving bodies of water. Original ferrous iron release may be by dissociation or oxidation of pyrite. Subsequently, a cyclic process occurs in which the ferrous iron is oxidized to the ferric state by oxygen. In turn, the ferric iron is reduced by the pyrite generating more ferrous iron. Chemoautotrophic bacteria are known to be involved in pyritic oxidation but their precise role has not been established. Pyrite oxidation may occur without these organisms. They may directly catalyze the overall chemical reaction rates or serve as specific agents which alter the intermediate reactions and hence the nature of the resulting byproducts but not the overall oxidation rate. The chemical and biological factors are being investigated by pilot plant methods which permit achievement of equilibria under controlled dynamic conditions. Equilibria are achieved under aerobic and nonaerobic conditions, with and without biological seeding and at fixed hydraulic flow rates. Excluding oxygen does not prevent pyrite dissolution, and a steady state release of ferrous iron results under dynamic conditions. Mine sealing practices to eliminate air entry may reduce but will not eliminate acid release. (Knapp-USGS)

SWICK V WEST VIRGINIA COAL AND COKE CO (DAMAGE TO LAND BY MINE DRAINAGE).

7 SE2d 697-699 (W Va 1940).

Descriptors: *West Virginia, *Property values, *Prescriptive rights, *Mine drainage, Mine water, Mine wastes, Ditches, Compensation, Coal mines, Waste disposal, Pumping, Land tenure, Damages, Land use, Land appraisal, Legal aspects, Judicial decisions, Industrial wastes, Damages, Drainage, Real property.

Plaintiff, owner of certain property as a remainderman, sought recovery for permanent damage thereto. The damage was caused by defendant mining company's having discharged mine water into a ditch across plaintiff's land. Plaintiff's mother, the life tenant, had given permission to the company to use the ditch. The lower court held for plaintiff. The appellate court acknowledged the right of a remainderman to sue for permanent damages caused to his land and to recover the diminution in the market value of the property. However, the court reversed, stating that the evidence failed to show that the value of the property had been reduced by the acts complained of. The court rejected the contention of the defendant that it had acquired a prescriptive right to use the ditch, stating that a permissive use based on verbal agreement could not ripen into a prescriptive right. (Hubener-Florida)

INLAND STEEL CO V ISAACS (FLOOD DAMAGE FROM MINE WATER).
143 SW2d 503-505 (Ky 1940).

Descriptors: *Kentucky, *Mine drainage, *Riparian rights, *Flood damage, Water pollution sources, Overland flow, Land use, Land tenure, Legal aspects, Mine water, Watercourses (Legal), Water release, Streams, Creeks, Currents (Water), Groundwater movement, Damages, Channels, Conduits, Leases, Contracts, Water storage, Judicial decisions.
Identifiers: *Mineral deed.

Defendant steel company was engaged in mining operations in Kentucky. Plaintiff owned 150 acres of land subject to defendants' mineral deed. One acre of land, which contained plaintiff's house, was excepted from this mineral deed. Defendant's mine flooded, causing damage to plaintiff's house and the pollution of his well. The court stated that an upper landowner is liable for damages to a lower landowner if he changes the ordinary flow of a stream or causes it to collect, and then casts it upon the lower estate in a larger volume or swifter current than normal. The mineral deed only gave defendant rights consistent with the interest and rights of plaintiff. Defendant was entitled to discharge water on plaintiff's land as was necessary or convenient in accordance with the mineral deed. However, the one acre of land containing plaintiff's house and well was excepted by the deed. Consequently, plaintiff had a cause of action for damages regarding the one acre. (Leesfield-Florida)

DISPATCHING SYSTEM FOR CONTROL OF COMBINED SEWER LOSSES,
Minneapolis-St. Paul Sanitary District, Minneapolis, Minn.
James J. Anderson.
An Interim Report to the Federal Water Pollution Control Administration. Minneapolis-St. Paul Sanitary District, Minneapolis, Minn., May 1969. 115 p, 76 fig, 20 tab. FWPCA Project 1-Minn.-1.

Descriptors: *Flow control, *Gate control, *Control systems, *Computers, *Telemetry, *Automatic control, *Regulated flow, *Pollution abatement, *Remote sensing, *Remote control, Data processing, Maintenance, Surface runoff, Sewers, Outlets, Urbanization, Monitoring, Mississippi River, Minnesota.
Identifiers: *Computer control of combined sewers, *Combined sewers, *Overflow regulators, Interceptors, Minneapolis-St. Paul Sanitary District.

The report describes a $1,741,000 demonstration project initiated as part of a national program designed to find alternatives to the costly method of sewer separation for reducing pollution of receiving waters from overflows of combined sewers. Key combined sewer regulators in the Minneapolis-St. Paul sewer system were modified. A system for remote control of these regulators and a system for monitoring liquid levels in major sewers are operational, using a small process control computer and leased telephone lines. Remote reading rain gages were connected to the system to permit using a mathematical model in the computer to predict storm flows in the interceptors and to guide operation of the regulators. To evaluate the effectiveness of these system modifications and the pollution caused by the sewer system, existing District data was converted to data processing form, the hourly strengths of wastes in the system were determined, and five robot monitors were installed to automatically record river water quality. The system, which is now operational, is said to be the most advanced of any municipal system in the United States. Significant reductions of pollution of the Mississippi River from overflows are attributed to: manual-remote monitoring of sewer levels, regulator modifications, and improved regulator maintenance. The program has demonstrated that overflow regulators can be remotely controlled using a computer-based telemetry system. The original completion date of July 1, 1969 cannot be met because of delays caused by a flood and contract difficulties. (Poertner)

CHARACTERIZATION AND TREATMENT OF COMBINED SEWER OVERFLOWS.
Engineering-Science, Inc., Arcadia, Calif.

City and County of San Francisco, San Francisco, California, November 1967. 202 p, 59 fig, 24 tab, 21 ref. FWPCA Grant WPD-112-01-66.

Descriptors: *Pollution abatement, *Discharge, *Overflow, *Discharge measurement, *Gates, *Outlets, *Impaired water quality, Water pollution effects, *Water pollution, *Sewage effluents, Flotation, Chlorination, Aeration, Sewerage.
Identifiers: *Combined sewer overflow, *Combined sewers, Sewer discharges, San Francisco, San Francisco Bay.

This publication is the final report of a study made by the City and County of San Francisco to develop workable systems to manage overflows from the combined sewers of San Francisco. The ultimate objective is to alleviate pollution of the Bay and the Pacific Ocean caused by sewer overflows. The

elby Street sewer system and the Laguna Street stem were used as study sites. Storm overflows ere monitored for quantity and quality charac-ristics. Rain gage measurements were also ecorded. A coliform survey of the municipal arina was made, and laboratory tests were con-ucted to select suitable methods for treating com-ned sewer overflows. The project findings were: 1) concentrations of various constitutents in the verflows follow a distinct pattern; (2) the decay me is constant; (3) separation of sewers would not sult in any significant reduction in the pollution f receiving waters; (4) coliform levels in receiving aters are significantly affected by wet weather ischarges; and (5) treatment of combined sewer verflows, using the dissolved air flotation process conjunction with chlorination, appears to be the ost feasible solution. Recommendations are made o continue the study and to construct a small treat-ent facility to treat the overflows from one of the inor outfalls of the City sewer system. The report ontains many figures, tables, illustrations and ex-ellent photographs of combined sewer overflow utfalls in the San Francisco system. The two study tes comprise 15 per cent of the City's habitable rea, mostly residential in land use. (Poertner)

RESERVOIR MIXING AND AERATION YSTEM,
linde Engineering Co., Highland Park, Ill.
. Nelson Hinde.
Vater and Wastes Engineering, Vol 7, No 3, p 50-3, Mar 1970. 4 p, 5 fig, 5 ref.

Descriptors: *Reservoirs, *Lakes, *Aeration, Reaeration, Dissolved oxygen, Air compressors, Air entrainment, Oxygenation, Limnology, Eutrophication, Aquatic life, Mixing, Aquatic environment, *Water quality, *Impounded waters, Turnovers, Plastic tubing.
Identifiers: Reservoir management, Air bubbles, Air release valves, *Bubbles system.

A system for aerating and mixing impounded water s described. Development of the system was based on: (1) increasing horsepower efficiency to move 0 to 1000 times as much water per hp as provided by other methods, (2) reducing bubble-rise rate to ess than 1 fps to eliminate turbulence and create a aminar uplift, (3) reducing bubble size to dissolve oxygen quicker, (4) inducing continuous turnover rom the rise of bubbles, (5) improving water quali-y by eliminating anaerobic conditions at the lake ottom, (6) reducing installation and operation osts. The system uses 0.5-in.-inside-diameter lastic pipe weighted by a lead strip. Air bubble heck valves are sized and spaced to meet water depth and circulation requirements. Air compres-or capacity and horsepower requirements are determined according to depth and length of tubing nstalled. The entire bottom of the lake need not be overed; sufficient circulation will be produced by placing tubing in one or more deeper areas. In deeper lakes the water rotates slowly to a distance of 15 mi from the aeration area. Within a relatively short period, bottom water is mixed, temperatures are equalized throughout the lake, accelerated eutrophication effects are overcome, and water quality is improved. (USBR)

WILLIAMS V PELICAN NATURAL GAS CO (MEASURE OF DAMAGES FROM OIL AND SALT WATER POLLUTION).

187 La 462, 175 So 28-34 (1937).

Descriptors: *Louisiana, *Damages, *Water pollution, *Fishkill, Pollutants, Water pollution effects, Water pollution sources, Oil industry, Oil, Oil wastes, Oil fields, Saline water, Fish, Dams, Swimming, Recreation, Ponds, Surface waters, Trees, Stock water, Judicial decisions, Legal aspects, Water quality, Water utilization, Adjudication procedure.

Plaintiff landowners sought damages from defendant oil companies as a result of oil and salt water pollution of a stream running through plaintiffs' land. Defendants operated several oil wells upstream from plaintiffs' property and had discharged salt water and waste oil into the stream. Plaintiffs alleged damages from fish kill, destruction of a pond dam, interference with swimming, timber loss, loss of sale of fresh water, and loss of water for stock. The trial court found defendants liable and awarded damages. Defendants appealed solely on the basis of the amount awarded. The Supreme Court of Louisiana, in amending the total award, ruled that damages from the fish kill could not be ascertained in that the number of fish found dead was uncounted. Moreover, evidence showed that the fish could escape from the pond built by plaintiffs. The award for loss of water sale was also stricken since it was shown that such sale would not have occurred regardless of the pollution. Judgment for the plaintiffs was affirmed as amended. (Barker-Florida)

WATER STUDIES IN OREGON.
Oregon State Univ., Corvallis. Water Resources Research Inst.

Oregon State University Water Resources Research Institute Fall Quarter 1969 Seminar, WR 012.69, Corvallis; published Janauary 1970. 131 p.

Descriptors: *Conferences, *Water resources, *Oregon, Water pollution control, Lumbering, Evapotranspiration, Forest management, Land management, Fisheries, Energy budget, Radioactive waste disposal, Hydrology, Thermal powerplants, Thermal pollution, Estuaries, Water law, Recreation, Treaties.
Identifiers: Oregon State University.

Seminars in water resources at Oregon State University in 1969 are compiled. They are the product of weekly presentations which included such varied subjects as water quality, water supply, tainted fish, thermal pollution, water treaty interpretations, economic impact, and cost sharing in recreation. Some of the investigations have been in progress only a relatively short period of time and the reports are preliminary in nature. The lectures were open to faculty members, students of all ages, representatives of federal and state agencies, and the general public. (See also W70-08476 thru W70-08478). (Knapp-USGS)

JERSEY CITY V STATE WATER POLICY COMM'N (CREATION OF LAKE VIA DAM CONSTRUCTION AND RIGHTS OF CITY ON RIVER BELOW).

181 A 873-875 (NJ 1935).

Descriptors: *New Jersey, *Water demand, *Impounded waters, *Water supply, Municipal water, Pollutants, Public health, Recreation wastes, Administrative decisions, Permits, Public rights, River flow, Dams, Spillways, Water storage, Riparian rights, Artificial use, Navigable waters, Reasonable use, Impoundments, Artificial watercourses, Reservoirs, Judicial decisions, Legal aspects.

Plaintiff city instituted a certiorari proceeding against the State Water Policy Commission and a realty company. Defendant realty company had been granted, pursuant to a state statute, a permit to construct a dam in a river to create a lake. Below the lake, in the same river, was a reservoir which was the source of the city's water supply. Plaintiff contended that the creation of the lake and the construction of bungalows and privies near the lake would result in a diminished and polluted water supply. The court found that the Commission had required and defendant had agreed to special conditions with regard to the construction of privies and the general use of the lake area so as to preclude pollution problems. The court also found that any reduction in the city's water supply would be minimal. The suit was dismissed with costs. (Price-Florida)

A TEST OF FLUSHING PROCEDURES TO CONTROL SALT-WATER INTRUSION AT THE W. P. FRANKLIN DAM NEAR FT. MYERS, FLORIDA,
Geological Survey, Tallahassee, Fla.
Durward H. Boggess.
Florida Bureau of Geology Information Circular No 62, Part 1, p 1-15, 1970. 15 p, 8 fig, 3 tab, 1 ref.

Descriptors: *Saline water intrusion, *Canals, *Water pollution control, *Locks, *Florida, Streamflow, Lowflow, Density currents, Mixing, Sea water, Navigation, Water pollution.
Identifiers: Canal operating procedures, Caloosahatchee River (Fla).

During low-flow periods, salty water from the tidal part of the Caloosahatchee River moves upstream during boat lockages at the W. P. Franklin Dam near Ft. Myers, Florida. The salty water moves upstream within the deeper parts of the river channel as far as 5 or more miles above the lock. Some mixing of the high-chloride deeper water and the fresher shallow water occurs in the affected reach above the lock, probably as a result of wind and waves, and turbulence created by boat traffic. Salt water can be flushed from the lock chamber prior to lockages at openings of 4, 6 and 8 feet. An opening of 8 feet or more appears preferable because of the smaller volume of water required and shorter discharge time involved. The quantities of salt water moving upstream can be effectively reduced by adopting changes in locking procedures. Flushing the lock chamber could result in a 50 percent reduction, whereas a combination of procedures would be even more effective in controlling salt-water intrusion. Under the present circumstances it appears unlikely that complete control and prevention of upstream salt water movement can be accomplished from a change in procedures as described; nor does it appear that complete control is entirely necessary if measures are started early in the dry season at the first indications of salt-water intrusion. (See also W70-08517). (Knapp-USGS)
W70-08516

SEIDEN V PASSAIC VALLEY WATER COMM'N (LIABILITY FOR SEDIMENT IN WATER SUPPLY).

199 A 420-423 (NJ Dist Ct 1938).

Descriptors: *New Jersey, *Water supply, *Impaired water quality, *Filtration, Administrative agencies, Filters, Water demand, Reservoirs, Plumbing, Judicial decisions, Legal aspects, Water conveyance, Water distribution (Applied), Water quality control, Potable water, Domestic water, Water purification, Conduits, Cities, Sands, Hydraulics, Hydraulic structures, Pressure conduits, Trap efficiency.

Plaintiff brought an action for damages to his plumbing system caused by the allegedly negligent failure of defendant to remove excess sand from its water supply. Defendant contended that its only duty was to deliver potable water fit for domestic

use. The court conceded that the water must be potable and fit for domestic use and also free from sediment which would affect plaintiff's plumbing. Defendant was under a legal duty to properly distribute the water, being just as liable for injuries to plaintiff's property resulting from water containing excess sand as it would be for injuries to the plaintiff's person resulting from polluted water. The doctrine of res ipsa loquitur was found to apply where the water containing the sand came exclusively from defendant's water mains into plaintiff's plumbing system. The presence of the sand in the water was an 'unusual occurrence' which made the doctrine applicable. The court found that defendant, in the exercise of reasonable care, should have discovered the presence of the sand in the water, and its failure to do so rendered it liable for plaintiff's damages. (Barnett-Florida)

CLINARD V TOWN OF KERNERSVILLE (DAMAGES TO LAND CAUSED BY OVERFLOW OF POLLUTED STREAM).
215 N C 745, 3 SE2d 267-272 (1939).

Descriptors: *North Carolina, *Cities, *Water pollution, *Eminent domain, Easements, Streams, Banks, Judicial decisions, Legal aspects, Shrubs, Obstruction to flow, Brush, Damages, Riparian rights, Flooding, Ditches, Municipal wastes, Sewage disposal, Environmental sanitation, Waste water disposal, Timber piles, Basins, Dye releases, Remedies, Overflow.
Identifiers: Nuisance (Continuing).

Plaintiff sought in a continuing nuisance action to recover damages to his real property caused by the pollution and overflow of a stream thereon. The stream also emitted noxious odors as a result of the pollution. The pollution was allegedly caused by emissions of waste water from defendant city's sewage disposal plant and by dye water discharged by defendant knitting mill. The overflow of the stream was allegedly caused by defendant city's filling in of the stream with timber and shrubbery. Upon finding that defendant mill had no control over the discharge of its dye water into the stream, since it deposited such water into a basin controlled by defendant city, the appellate court allowed a non-suit as to defendant mill. Defendant city was held responsible; however, the court construed the plaintiff's remedy as one in the nature of a condemnation proceeding. The court stated that except as affected by rights peculiar to riparian ownership, plaintiff's recovery did not depend on whether the damage was caused by the polluted water or noxious air therefrom. Instead, the injury was deemed a taking for which defendant city had to compensate plaintiff. After such payment defendant city obtained a permanent easement in plaintiff's land. (Barnett-Florida)

MICHELSEN V LESKOWICZ (DUCK FARM ON STREAM AS NUISANCE).

55 NYS2d 831-841 (Sup Ct 1945).

Descriptors: *New York, *Ducks (Domestic), *Zoning, *Diversion, Stream, Competing uses, Riparian rights, Reasonable use, Judicial decisions, Legal aspects, High water mark, Hurricanes, Bogs, Erosion, Thalweg, Boundaries (Property), Oceans, Alteration of flow, Tides, Animal wastes (Wildlife), Remedies, Adjudication procedure, Odor, Riparian land
Identifiers: *Nuisance, Feces.

Defendant upstream riparian owner raised ducks on the stream adjoining both his and plaintiff's property. Plaintiff, a downstream owner, brought action alleging that: (1) defendant had unlawfully diverted the stream waters; (2) defendant was trespassing on plaintiff's property by use of a footpath thereupon, and (3) defendant's ducks were a nuisance in that they created odor and noise and polluted the water by fecal discharge. The appellate court held that: (1) plaintiffs were not injured by the defendant's slight scooping of soil from the creek bed, which had caused a minor recession of water from plaintiff's side of the stream; (2) defendant's use of the footpath was a trespass which should be enjoined; and (3) defendant could not be enjoined from raising ducks because of laches on the part of the plaintiff. Defendant had been raising ducks continuously on the property for 40 years, and plaintiff's failure to object within that time precluded any injunction. Moreover. the defendant's property was zoned for such purpose. Also, plaintiff had moved to the nuisance and could not therefore complain. (Barnett-Florida)
W70-08553

CITY OF LYNCHBURG V CHESAPEAKE AND O RY (PRESCRIPTIVE RIGHT OF CITY TO HAVE CANAL MAINTAINED FOR SEWAGE DISPOSAL PURPOSES).

195 SE 510-514 (Va 1938).

Descriptors: *Virginia, *Prescriptive rights, *Canals, *Sewage disposal, Easements, Land tenure, Discharge lines, Outlets, Railroads, Inland waterways, Water supply, Relative rights, Remedies, Legal aspects, Judicial decisions, Water rights, Water levels, Flow control, Public benefits, Maintenance costs, Municipal wastes, Legislation, Public rights, Aqueducts.

Defendant railroad had previously obtained permission to abandon a canal near plaintiff city. Plaintiff sought to enjoin defendant from closing the canal, claiming that it had acquired a prescriptive right to have the railroad maintain the canal at a level suitable for sewage disposal by the city. The court stated that a prescriptive right to empty sewers into private water courses could be maintained by the city. Plaintiff, however, sought to force defendant to maintain a sewage disposal system for the city at the railroad's expense. The court held that in the absence of an express contract to the contrary, such an obligation to do a positive act was not imposed on defendant by plaintiff's easement. Furthermore, the canal itself had taken on many aspects of property dedicated to a public use to which no prescriptive rights could attach. Therefore, the court held that plaintiff could not force defendant to maintain the canal. (Caldwell-Florida)
W70-08561

MAYOR OF CAMBRIDGE V DEAN (POWER OF PUBLIC OFFICIAL TO BRING SUIT TO ABATE POLLUTION).
14 NE 2d 163-166 (Mass 1938).

Descriptors: *Massachusetts, *Pollution abatement, *Local governments, *Remedies, Industrial wastes, Water pollution, Impaired water quality, Water supply, Cities, Public health, Legal aspects, Judicial decisions, Legislation, Relative rights, Water pollution control.

Plaintiff mayor of Cambridge sought to enjoin the operation of a piggery located in adjoining localities. The piggery was situated upstream, and pollution from its operation affected Cambridge's water supply. The court held that as an individual plaintiff had no right to maintain the suit, and his right as mayor was no greater than his individual right. The court indicated that had the suit been brought in the name of the city, or had a statute authorized the mayor to sue in his official capacity, a cause of action would have been stated. Although there were statutes forbidding certain acts connected with the keeping of pigs and other animals within a prescribed distance of streams, the complaint did not allege violations of these provisions. Therefore the complaint was dismissed. (Caldwell-Florida)

THOMPSON V CITY OF MALDEN (DISPOSAL OF SEWAGE).
118 SW2d 1059-1065 (Mo Ct App 1938).

Descriptors: *Missouri, *Drainage districts, *Cities, *Waste water disposal, Drainage, Ditches, Drainage systems, Drainage water, Sludge Treatment, Coliforms, Flow, Pipes, Drains, Drainage effects, Outlets, Liquid wastes, Effluents, Sewage effluents, Waste water treatment, Judicial decisions, Legal aspects, Waste water (Pollution), Municipal wastes, Remedies.

Plaintiff drainage district sought an injunction to restrain defendant city from connecting a sewer outlet to one of plaintiff's drainage ditches. Plaintiff alleged that defendant was discharging noxious chemicals and sewage into the ditch, thereby polluting the water in violation of applicable law. Defendant admitted such acts but alleged that: (1) the sewage disposal plant was of the most approved pattern; (2) the sewage was converted into an inoffensive fluid state; and (3) prior to building the plant, defendant had obtained oral permission from the county court to discharge the sewage into the ditch, although such permission had since been revoked. From a judgment for plaintiffs granting a permanent injunction, defendant appealed. In affirming, the appellate court held that the act of connecting with the drainage ditch was illegal, without color of law and of itself a legal wrong in that it attempted to subordinate the ditches of the plaintiff to a user by the city without first complying with the applicable statute requiring negotiation of a binding contract, with adequate consideration, between defendant and plaintiff. (Barnett-Florida)
W70-08568

RIGGS V CITY OF SPRINGFIELD (WATER POLLUTION DAMAGES FROM DISPOSAL OF MUNICIPAL SEWAGE).
126 SW2d 1144-1153 (Mo 1939).

Descriptors: *Missouri, *Municipal wastes, *Sewage disposal, *Water pollution, Water pollution sources, Sewage, Wastes, Sewage effluents, Sanitary engineering, Waste disposal, Effluents, Pollutants, Impaired water quality, Water pollution effects, Fouling, Odor, Riparian rights, Judicial decisions, Damages, Relative rights, Legal aspects.

In an action for damages, plaintiff riparian landowners contended that defendant city had emptied sewage into a stream which crossed their land, thereby polluting the water and creating unpleasant odors so as to diminish the value of such land. Defendant contended that it had appropriated the use of such stream pursuant to statutory authorization, and that any claim for damages had accrued at the time of initial appropriation. Defendant therefore contended that plaintiffs' action was barred by the running of a five year statute of limitation. The court held that the law of eminent domain applied and not the law of nuisance. Thus the city's appropriation through its eminent domain power of the right to use the stream for sewage disposal purposes created a cause of action for permanent damages which accrued, if at all, at the time of such initial appropriation. Five years having run from such initial appropriation, the plaintiffs' claim was barred by the statute of limitations. (Snow-Florida)
W70-08571

KING V CITY OF ROLLA (WATER POLLUTION DAMAGES CAUSED BY MUNICIPAL SEWAGE DISPOSAL).
130 SW2d 697-702 (Mo Ct App 1939).

Descriptors: *Missouri, *Water pollution, *Municipal wastes, *Sewage disposal, Disposal, Impaired water quality, Pollutants, Treatment facilities, Wastes, Water pollution sources, Sewage, Septic tanks, Streams, Effluent streams, Waste disposal, Sewage effluents, Sanitary engineering, Relative rights, Legal aspects, Judicial decisions, Damages.

In an action for damages, plaintiff alleged that defendant municipality had discharged sewage from a septic tank into a creek which flowed through plaintiff's land. Plaintiff contended that such

scharge rendered such creek unfit for farm use d gave off offensive odors so as to diminish the arket value of his land. Defendant contended that e action was barred by the running of a five year atute of limitation. The court stated that under e law of eminent domain, which requires com- nsation for property taken by condemnation or appropriation, a cause of action arises at the ne the use of a stream is first appropriated. Under e law of nuisance, there is a continuing accrual of cause of action. The court held that the instant se was governed by the law of eminent domain, d consequently, since the creek was first used e years prior to the bringing of the action, the atute of limitations barred recovery. (Snow- orida)

EWER IMPROVEMENT DIST NO 1 V JONES DAMAGES FOR IMPROPER MAINTENANCE F SEWAGE FACILITIES).
34 SW2d 551-555 (Ark 1939).

escriptors: *Arkansas, *Eminent domain, Remedies, *Sewage disposal, Sewers, Cities, Vaste water disposal, Municipal wastes, Ditches, ffluents, Sewage effluents, Waste water (Pollu- on), Conduits, Septic tanks, Structures, Pipes, rains, Judicial decisions, Legal aspects, Odor, Vater pollution effects, Riparian rights, Streams, ssessments, Damages, Compensation.

laintiff brought action against defendant sewer istrict for damages to his land occasioned by the nproper maintenance and operation of a septic nk and two ditches through which polluted water rossed his land. It was undisputed that the septic nk was erected more than 3 years prior to suit nd that, in fact, the tank was not properly main- ined. From a verdict for plaintiff in the lower ourt, defendant appealed. The court found that efendant, under its right of eminent domain, had aused ditches to be dug across plaintiff's lands into hich polluted water flowed. For this, plaintiff had he right to be fully compensated for any damages uffered as a result thereof, based upon the theory f a permanent taking under the right of eminent omain, if suit were brought within three years of he exercise of such right. Since that had not been one in the instant case, plaintiff's action was arred by the statute of limitations. However, the ourt stated that the limitation upon the time ithin which suits for damages must be brought oes not apply to a suit to abate a nuisance. Defen- lant's plant, so maintained and operated as ad- nitted in the court below, was a nuisance which ould be abated through an action in equity. (Bar- ett-Florida)

06. WATER RESOURCES PLANNING

6B. Evaluation Process

ANTHROPOLOGICAL ANALYSIS OF SOCIAL AND CULTURAL BENEFITS AND COSTS FROM STREAM CONTROL MEASURES, Phase I,
Kentucky Univ., Lexington.
Henry F. Dobyns.
Project Completion Report, January 1-June 30, 1969. 8 p. OWRR A-022-KY (1).

Descriptors: *Social change, *Social impact, Kentucky, Dams, Drainage systems, Costs, Regulated flow.
Identifiers: *Anthropological data, *Social benefits, *Cultural benefits.

Anthropological research was initiated to collect data concerning social indicators to anticipate possible cultural changes in three central Kentucky river drainages as a result of dams being planned for them. The basic field research procedure broke down overall project objectives into geographic areas and methodological tasks which could be managed by individual students. A unique feature of this project was the use of secondary school students who served as research aids and kept precise household records. Papers initiated during Phase I of this project included: 'Ethnohistory and Contemporary United States Social Problems' (a summary of findings of the institutional inventory of settlements in twelve Kentucky counties); 'Economic Institutions as Social Indicators' (a paper demonstrating how anthropological data, such as kinship, may be employed as a social indicator); 'The Differential Effects of Advanced Communication, Transportation, Centralization and Affluence on Disaster Relief in a Kentucky Town' (the process of settlement competition, with selective decline and growth); 'Industrialization Without Modernization' (major socio-economic development factors made in a single county with a varied ecology); and 'Whither the Country Shore: A Special Case in the Historical Process of Institutional Centralization.' (Starr-Chicago)

EVALUATION OF THE SOCIAL IMPACT OF RESERVOIR CONSTRUCTION ON THE RESIDENTIAL PLANS OF DISPLACED PERSONS IN KENTUCKY AND OHIO,
Kentucky Water Resources Inst., Lexington.
Richard L. Ludtke, and Rabel J. Burdge.
Available from the Clearinghouse as PB-192 808, $3.00 in paper copy, $0.65 in microfiche. Research Report No 26, 1970. 160 p, 3 tab, 36 fig, 66 ref. OWRR Project A-020-KY (1).

Descriptors: *Social aspects, *Social adjustment, Social change, *Attitudes, Kentucky, Ohio, Population, Decision making, *Reservoirs.
Identifiers: Demography, *Migration (Population).

The states of Kentucky and Ohio have numerous reservoir projects at various stages of planning and construction. Each of the projects produces substantial social impact for the residents of the area and particularly for those persons affected by a loss of property and homes. This impact is not uniform in that people respond differently to displacement and the methods of adjusting relocation are known to differ among people. This research was initiated to develop and test a model for explaining migration under such conditions. The model includes a consideration of people's potential for transferring existing statuses to new residences, the extent to which peoples interests are served by the reservoir, people's knowledge of the reservoir, the social class levels of those displaced and the extent to which people identify with their places of residence. These factors are viewed as affecting people's levels of apprehension and consequently their willingness to separate from their current membership systems. Data for this investigation come from all the adult residents of the areas to be flooded near Taylorsville, Kentucky and Lebanon, Ohio. These areas are in the Louisville District of the U.S. Army Corps of Engineers and exhibit similar topographies with rural populations of similar socio-economic and social isolation. The testing of this model indicated that apprehensions over money is great for those persons who identify strongly with their present homes. Also, apprehension over migration was less for those persons whose vested interests were served by the project. Knowledge of the reservoir project did not reduce apprehensions over moving as was predicted by the model.

EFFECT OF MUNICIPAL WATER SERVICE POLICIES ON ECONOMIC GROWTH IN SUBURBAN AREAS,
Georgia Inst. of Tech., Atlanta. Engineering Experiment Station.
George I. Whitlatch, and Winfred G. Dodson.
Available from the Clearinghouse as PB-193 027, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Project B-367, June 1970. 62 p, 3 tab, 1 fig, 15 ref, append. OWRR Project A-024-GA (1).

Descriptors: *Industrial water use, *Municipal water policy, *Water rates, *Water costs, *Economic impact, *Community development, City planning, Georgia, Economic benefits, Local governments, Political constraints, Public benefits, Social impact, Social values.

Municipal water service policies were investigated in 27 Georgia cities to determine the effect on economic growth in suburban areas. Over 200 new industries located in or near these cities during the period, 1964-1969, of which 45 located outside of the corporate limits of 19 of these cities. Only seven of the 27 cities were judged to have formal consistent water service extension policies. The others lack a consistent policy or have none at all. Lack of consistent water service policies was found to handicap industrial development efforts of the cities and underpricing of water to industry outside the cities was notable. Principal conclusions of the study are: Extension of water service to outside industry is overemphasized and quality of service is seriously underrated; a cheap water policy is not essential to attract industry; cities should establish water rates to fully support outside service including fire protection; water service should be extended to industrial areas that can be annexed; the better municipal services of an industrial location within a city outweigh tax savings of an outside location. (Conway-Georgia Tech)

ATTITUDES AND ATTITUDE CHANGE RELATING TO WATER RESOURCES,
Georgia Inst. of Tech., Atlanta. School of Psychology.
C. Michael York.
Available from the Clearinghouse as PB-193 028, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Apr 1970. 31 p, 47 ref. OWRR Project A-019-GA (1).

Descriptors: *Attitudes, *Social behavior, *Psychological aspects, Social aspects, Motivation, Decision-making process, Scaling, Water resources, Reviews.
Identifiers: *Attitude change, *Credibility variable, *Likert-type attitude scale.

A state of the art review was made of the nature and measurement of attitude in terms of its utility in the water resources field in Task I of a two-task project. Several methods of measurement are discussed to point up the range of approaches and data outcomes available for use among the social and behavioral science community. Task II involves an experimental investigation of the critical variable of source credibility within the attitude change process. An individual's attitude was chosen as the principal index of behavioral tendency. A Likert-type attitude scale was used for 'before-test' data gathering on the issue, fluoridation of a community water supply. The student audience then viewed a widely used public information film which portrayed the advantages of this technological innovation. The film was narrated by Dr. Spock. 'After-test' measures included attitude toward fluoridation and perceptions of the speaker or communication source. Attitudes were observed to be more favorable after the film and the credibility ratings were related positively to the expressed attitude. (Conway-Georgia Tech)
W70-08421

A FEASIBILITY STUDY IN COMMUNICATIONS EFFECTIVENESS: EVALUATING A PERSUASIVE FILM RELATING TO A WATER ISSUE,
Georgia Inst. of Tech., Atlanta. School of Psychology.
C. M. York.
Available from the Clearinghouse as PB-193 021, $3.00 in paper copy, $0.65 in microfiche. Addendum to Report WRC-0569, Water Resources Center, Georgia Institute of Technology, Sept 1969. 20 p, 2 fig, 5 tab, 13 ref, append. OWRR Project No B-024-GA (2).

Descriptors: *Social impact, *Evaluation, *Attitudes, Social aspects, Psychological aspects, Fluoridation, Water treatment, Motivation, Management.
Identifiers: Publicity evaluation, Propaganda, Sociology.

A persuasive film on water supply fluoridation was evaluated by use of attitude questionnaires, discussions, and interviews. In the pilot study among college students, the hypothesis that no significant change in attitude would be observed for the control subjects, who saw no film, was supported by a t-ratio less than unity. The pre-test and retest attitudes (average group scores) were 85.5 and 86.3 respectively, with comparable variability in rating response. Those in the film-only group exhibited a mean score of 81.4 during pre-testing, then expressed a significantly more favorable attitude (88.3) a few minutes after the film, with a significant t-value of 2.95. The 17 persons in the film and discussion group, had slightly higher favorability scores (88.1) prior to the test. Their after-film average was even higher (93.1), revealing a significant shift in attitude, with a t-value of 3.8. Inspection of the delay-scores one month later indicated a uniform reduction in the degree of favorableness. (Knapp-USGS)

PROMOTING AGRICULTURAL DEVELOPMENT,
International Bank for Reconstruction and Development, Washington, D.C.
Dinesh Bahl.
Finance and Development, Volume 7, Number 2, June 1970, p. 38-43, 3 photos.

Descriptors: *Irrigation programs, Land development, *Agronomy.
Identifiers: Food and Agriculture Organization, United Nations Development Programme, Green revolution, Second World Food Congress, International Finance Corporation.

The World Bank has financed agricultural development projects since 1948 but not until the 1960's did this type of assistance account for a substantial percentage of Bank loans. Irrigation projects were one of the first kinds of loan made by the Bank for agricultural development. However, although the number of irrigation construction projects is still numerous and although only 15 to 20 percent of cultivable land in developing countries is irrigated, still the Bank has realized that irrigation is merely the first step toward increased agricultural development. Extending credit loans, financing extension services and assisting fertilizer plant construction are becoming important Bank concerns as well. (Holmes-Rutgers)

SOCIO-ECONOMIC SIMULATION FOR WATER RESOURCE SYSTEM PLANNING,
Department of Energy, Mines and Resources, Ottawa (Ontario).
Peter J. Reynolds, and Asit K. Biswas.
13th Congress International Association Hydraulic Research Proceedings, Vol 1, p 75-82, Aug-Sept 1969. 8 p, 1 tab, 21 ref.

Descriptors: Water resources, Water resources development, *Economic feasibility, *Simulation, River basin development, *Social aspects, Mathematical models, *Models, Economics, Ecology, Effects, *Sociology, Human resources, Decision making, Bibliographies, Evaluation, Planning, Multiple-purpose projects, Reviews, Policy matters.
Identifiers: Regional planning, Human relations, Canada, Alternatives.

The current status of socio-economic simulation in water resource planning is reviewed. Efficient allocation of limited national resources among a variety of competing government programs can be achieved only by measuring their relative cost-effectiveness. This can be done by evaluating social, political, and economic effects on human beings. Until national and basin socio-economic models are available, evaluating alternative public policy programs on disparate regions and distinct socio-economic groups would be difficult for policy planners. The state of the art in socio-economic modeling has advanced sufficiently to be useful in water resource policy planning and decisionmaking. Modeling also gives the analyst a better insight into the various interactions within the complex processes, and will point out methods for dealing with the socio-economic phenomena associated with water resource system design. Up to now, ecology has not been considered. If water resource policy planning is to be more effective, a comprehensive system must be developed incorporating the interdependence of a multi-region, socio-ecologic system that would allow more satisfactory sets of policy alternatives to be evaluated. THE ARIZONA WATER CONTROVERSY: AN ECONOMIST'S VIEW,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
Robert A. Young.
Journal of the Arizona Academy of Science, Vol 6, No 1, p 3-10, March 1970. 16 ref.

Descriptors: *Cost-benefit analysis, *Water demand, *Arizona, *Economic justification, *Economic impact, Water costs, Water allocation (Policy), Water distribution (Policy), Administrative agencies, Competing uses, Equitable apportionment, Irrigation practices, Irrigation programs, Water resources development, Water supply, Water utilization, Benefits, Costs, Planning, Productivity, Project feasibility, Employment, Social impact, Budgeting, Wages, Value.
Identifiers: *Central Arizona Project, *Direct value of water, Marginal economic sectors.

For the past 2 decades water policy planners in Arizona have assumed that state economic well-being and growth is crucially dependent on augmented water supplies. However, during the same period, and without augmented water supplies, the state has registered growth rates of 200-600 percent. Returns per unit of water intake are 16 dollars per acre foot in the grain and forage sector and 80,000 dollars per acre foot in the manufacturing sector. The nonagricultural sectors of the economy have increased about ten-fold since World War II, and there is much evidence to indicate that agriculture has at least held constant, despite many assertions to the contrary. A cost-benefit analysis of the Central Arizona Project estimates that added returns to the state will be considerably less than one-half the associated cost, causing hardships for the large non-agricultural proportion of the economy. It is concluded that: (1) Agriculture is a marginal sector contributing relatively little to the state economy, and is unimportant to future economic growth (2) Current water resources are adequate for projected growth in the non-agricultural sector (3) The projected benefit-to-cost ratio does not justify a water augmentation scheme and could lead to large losses of public funds. ENVIRONMENTAL THREAT AND SOCIAL ORGANIZATION,
International Union of Anthropological and Ethnological Studies.
Lawrence Krader.
The Annals of the American Academy of Political and Social Science, Vol. 389, May 1970, p 11-18. 7 ref.

Descriptors: *Social values, *Environment, Management, Costs, Attitudes.
Identifiers: *Social organization, *Environmental threat, Society, Policy, Environmental problems, Ecology of abundance, Ecology of scarcity.

The mental approach of the natural scientist to the study of the physical environment contrasts with the social science approach. The unit of study is the same: in both cases it is the society, but instead of value-free adaptations (of the natural sciences), the social sciences tend to evaluate environmental relations as beneficent or dangerous to man. American society has its adaptive niche on the North American continent, but in its brief history, we note a change in attitude from the first settlers' confident belief that nature will provide for mans wants, to our present sense of the threat to social existence generated by environmental problems. This is coupled with a growing conviction that past policies of uncontrolled depletion have brought about the change from an ecology of abundance to an ecology of scarcity. We are passing through a climacteric at present regarding quantity and quality of water supply, and as we change our philosophy of natural resources generally, so do we change our management policies toward them in particular. We are making up our minds that what was cheap or free will now become expensive. The pills of rising costs and taxes are a bitter dosage. (Davis-Chicago)

nnals of the American Academy of Political and cial Science, Vol. 389, May 1970, p 19-26. 1 fig, ef.

escriptors: *Environment, Equilibrium, Ecology, ress.
entifiers: *Adaptative mechanisms, *Systems, edback mechanisms.

ving systems tend to maintain in equilibrium vari-les associated with their continued existence. En-ronmental conditions which force these variables eyond their normal ranges produce stress within e system. Feedback mechanisms then seek to store equilibrium. Stress arises from overloads or nderloads of energy and information, as well as om inputs which have threatening implications. he process of adapting to stress depends partly on e nature of the stress-producing agent and partly n the mechanisms available to the system. When e system is subjected to extreme environmental onditions for an extended period of time, adapta-ve responses may become increasingly costly. A ossible outcome is one of the 'diseases of adapta-on.' Eventually, adaptative mechanisms may fail nd the system may collapse. The stress encoun-ered by most individuals arises from the symbolic, ather than the physical, aspects of their environ-ent. Further, most studies of men under stress eveal a remarkable capacity for adaptation to ex-eme environments. (Davis-Chicago)

ECONOMIC GUIDELINES FOR LAND AND WATER RESOURCE USE IN AGRICULTURE,
Alberta Univ., Edmonton. Dept. of Agricultural Economics.
Travis W. Manning.
Canadian Journal of Agricultural Economics, Vol. 17, number 3, November 1969, p 1-8. 13 ref.

Descriptors: *Water allocation (Policy), Recrea-ion demand, Resource allocation, Economics, *Water demand.
Identifiers: *Federal Task Force on Agriculture, Economic Council of Canada.

Agriculture in Canada is faced with growing problems of overproduction, low farm incomes and too many farmers. The author discusses non agricultural uses of land and water resources, stressing particularly recreational uses. Although many of the factors considered in land and water allocation are the same, water resource use is more economically calculable and can be measured as a capital input more readily. Nonetheless the effects of water resource development projects may be as difficult to reverse as land use projects. Therefore, the author urges more careful consideration of the benefits and disadvantages of new water resource development particularly in western Canada. (Holmes-Rutgers)

REPORT TO THE REGIONAL PLANNING COUNCIL, BALTIMORE, MARYLAND ON A PLAN FOR REGIONAL WATER SUPPLY TO THE YEAR 2020, VOLS. I, II.
Hazen and Sawyer, New York.

Financial assistance provided by HUD under Section 701 of the Housing Act of 1954. June 1969.

Descriptors: *Water demand, *Water supply, *Water works, *Water distribution, *Water treatment, *Municipal water, *Cities, *Planning, *Water resource development, *Comparative costs, *Water shortage, *Reservoir sites, Urbanization, Long term planning, Future planning, Capital costs, Construction costs, Forecasting, Waste water treatment, Water reuse.
Identifiers: *Baltimore, *Potomac River, *Susquehanna River, Baltimore Regional Planning Council.

This two-volume report to the Baltimore Regional Planning Council presents findings and recommendations resulting from a study of the water supply needs, to the year 2020, of the City of Baltimore and the counties of Anne Arundel, Baltimore, Carroll, Harford and Howard. The engineers estimated that the present 2 million population will grow to 4.8 million persons by the year 2020. Average water demands on public systems, including industrial requirements, are expected to increase from 265 mgd to 900 mgd during the period. Maximum-day water demands in various parts of the service area will range from 40 to 70 per cent more than average use. The average water deficit by the year 2000 is estimated at 120 mgd, and 350 mgd by the year 2020, if water supply capacities are not increased. The sources of water supply best suited to regional development are the Susquehanna River at Conowingo, Deer Creek in Harford County, and the Potomac River. Conversion of sea water and reclamation of sewage and industrial wastes are not recommended because of high costs and lower quality. Volume I of the publication contains the main text and recommendations. Volume II contains 12 appendices which serve as documentation. (See also W70-07848 and W70-07849) (Poertner)

Water supply requirements and recommendations for facilities to the year 2020 are detailed in this report to the Baltimore Regional Planning Council. The service area includes the city of Baltimore and its five contiguous counties. The engineers made the following recommendations: (1) develop a 570 mgd water supply from both the Potomac and Susquehanna Rivers, and enlarge the W.S.S.C. Triadelphia Reservoir from 7 to 40 billion gallons; (2) promptly acquire land on Deer Creek for the Darlington Reservoir; (3) negotiate with the Washington Suburban Sanitation Commission regarding the purchase or lease of Triadelphia Reservoir and acquire land for enlargement (if negotiations fail, purchase the Gillis Falls site); (4) Carroll County should acquire sites for the proposed new Windsor Reservoir (in addition to Piney Run and Union Mills), and a 5 billion gallon reservoir on Gillis Falls if the latter is not used for the central supply system; (5) detailed engineering and comparative cost studies should be made to permit prompt acquisition of land and rights-of-way for (a) treatment plants and sludge disposal, (b) transmission main routes, and (c) ground storage reservoirs; and (6) adequate staff and funds should be made available soon. (See also W70-08437) (Poertner)

ETHNOHISTORY AND CONTEMPORARY UNITED STATES SOCIAL PROBLEMS,
Kentucky Univ., Lexington.
Henry F. Dobyns.

Available from the Clearinghouse as PB-192 761, $3.00 in paper copy, $0.65 in microfiche. Paper presented at 17th Annual Meeting, American Society of Ethnohistory, Ithaca, New York, October 24, 1969. 22 p, 1 tab, 36 ref. OWRR Project A-022-KY (2)

Descriptors: *Social change, *Social impact, *History, Kentucky, Dams, Drainage systems, Regulated flow, Ecological distribution, Community development.
Identifiers: *Ethnohistory, *Anthropological data, *Social benefits, *Cultural benefits.

Research was initiated by anthropologists in three study units in Kentucky to ameliorate critical social conditions. The research was based on three basic policy assumptions: (1) a society can only afford to finance science activity whose findings can be utilized; (2) anthropologists should be aware of the policy implications of their research; and (3) the anthropologist theory should withstand the test of application to practical problems. The research objective was to compile cultural data for a baseline description of the units being studied in 1969-1970 before stream-control measures are taken. Future research in this project is aimed at measuring cultural change produced by these stream-control measures. The theory of community development is being tested; research has uncovered evidence that there is competition between settlements in Kentucky for population and institutions. Subcultural difference implying historical divergence exist between members of one ethnic group in counties within even a limited portion of a single state. The study of water use and management in these study areas in Kentucky focuses upon historic cycles in ecological influences. (Starr-Chicago)

INSTITUTIONAL FACTORS AND THE TEXAS WATER PLAN,
Texas A and M Univ., College Station. Dept. of Agricultural Economics and Sociology; and Texas A and M Univ., College Station. Water Resources Inst.
Warren L. Trock, and Clarence W. Jensen.
Water Resources Bulletin, Vol 6, No 2, p 261-268, March-April 1970. 8 p, 21 ref. OWRR Project No B-025-TEX.

Descriptors: *Water resources development, *Planning, *Water law, *Institutions, *Mississippi River, Legislation, River basin development, Water allocation (Policy), Water transfer, Inter-basin transfers, Water rights, Interstate, Interstate rivers.
Identifiers: Texas Water Plan.

Among the many problems associated with the implementation of the Texas Water Plan are the institutional arrangements necessary for interstate diversions, for management of transfer systems, for allocation and sale of water, and for developing repayment capabilities among water users. To make a transfer system functional, a diversion in perpetuity is necessary. There will be important private and public resistance to diversion from the Mississippi because (1) it is navigable for a good portion of its length, (2) its waters are shared by several states, (3) there is considerable economic dependence on the stream, (4) it has significant subjective value and (5) other considerations create demands for maintenance of the river in its present state. DAVIDSON V VAUGHN (CONVEYANCE OF A RIGHT TO WITHDRAW WATER FROM A NATURAL WATERCOURSE).

44 A2d 144-149 (Vt 1945).

Descriptors: *Vermont, *Streamflow, *Usufructuary right, *Water sources, Discharge (Water), Water management (Applied), Diversion, Judicial decisions, Legal aspects, Routing, Bypasses, Diversion structures, Springs, Fresh water, Water supply, Relative rights, Contracts, Water users.

Plaintiff and defendant, adjacent land owners, entered into an agreement in which defendant granted to plaintiff a perpetual right to tap a spring and the brook flowing therefrom, and to convey the water from said spring and brook by suitable means. Plaintiff was building a cottage on his land and was taking lawful advantage of his agreement with defendant when his house was destroyed. He constructed a larger house at a higher elevation and, to utilize the spring water, he had to build a spring house and draw water from the brook, instead of the spring, as had previously occurred. Defendant attempted to prevent plaintiff's use of the water. Plaintiff brought suit to restrain defendant's acts. The court held that conveyance of a perpetual right to tap a spring and brook is not limited as to place or method, and a grantee's right to take water is not limited to the place where the water was being taken from at the time the conveyance was executed. Consequently plaintiff had the right to take the water directly from the spring or from any part of the brook that issues from it. (Barnett-Florida)

TAIT V FIRST FEDERAL SAVINGS AND LOAN ASS'N (SUIT TO RESTRAIN INTERFERENCE WITH WATER RIGHTS).
132 N J Eq 493, 28 A2d 764-765 (1942).

Descriptors: *New Jersey, *Easements, *Pipelines, *Reservoir storage, Water supply, Judicial decisions, Legal aspects, Wells, Water wells, Reservoirs, Domestic water, Water demand, Pipes, Distribution systems, Land tenure, Real property, Relative rights.
Identifiers: Grants (Deeds).

Suit was brought by complainant to restrain threatened interference with water rights granted to her. Complainant was the grantee of land adjacent to land held by her grantor. The deed from grantor to complainant contained a grant of water rights in an existing water supply on the grantor's land. The grant permitted the running of pipes across the grantor's land to conduct the water. Two years after the grant the source of water supply was changed by the grantor from a reservoir to a well, to which complainant connected her pipes under an oral agreement with grantor. Defendant took a mortgage on the grantor's lands with constructive knowledge of complainant's easement and rights in the water. Defendant contended that the easement that did exist was terminated by a change in the source of supply. The court found this contention unsound since it placed too narrow a construction on the deed and did not take into consideration the facts and circumstances involved. At the time of the execution of the mortgage, the grantor would have been estopped from interfering with complainant's rights to obtain water since by his own acts he had cut off the reservoir supply. This estoppel extended to defendant mortgagee. (Barnett-Florida)

HANSEL V COLLINS (RELATIVE RIGHTS OF ADJOINING LANDOWNERS IN WATER PIPELINE).

23 A2d 686-690 (Md 1942).

Descriptors: *Maryland, *Prescriptive rights, *Easements, *Pipelines, Land tenure, Boundaries (Property), Real property, Legal aspects, Compensation, Water supply, Domestic water, Relative rights, Water demand, Water utilization, Judicial decisions.
Identifiers: *Injunction.

Plaintiff and defendant held adjoining tracts of land from a common grantor. Defendant's predecessor in title had constructed to his house a water pipeline which ran across a corner of plaintiff's land. Defendant's predecessor in title granted to plaintiff's predecessor in title permission to use water from the line. Defendant subsequently demanded that plaintiff either pay for use of the water or disconnect from the pipeline. When plaintiff refused, defendant began to construct a pipeline around plaintiff's property. Plaintiff sought to enjoin interference with his use of the line. Defendant asked an injunction against plaintiff's use. The court held for defendant stating that, since plaintiff's predecessor in title had not contributed to the cost of constructing the line nor given permission for it to cross his land, plaintiff could not claim co-ownership of the line as a successor in interest. An implied grant of easement could not be found since the common grantor had conveyed plaintiff's estate after conveying defendant's estate and there had been no express reservation of an easement over plaintiff's land. A prescriptive right to use the pipeline could not be claimed since the water had not been taken adversely for a 20 year period. (Hubener-Florida)

TOY V ATLANTIC GULF AND PACIFIC (LIABILITY FOR FILLING OF CREEK BED).

4 A2d 757-767 (Md 1939).

Descriptors: *Maryland, *Dredging, *Accidents, *Access routes, Engineering structures, Channel improvement, Excavation, Embankments, Concrete structures, Damages, Obstruction to flow, Riparian rights, Beds under water, Navigable waters, Ownership of beds, Navigation, Transportation, Fishing, Collapse, Buckling, Weirs, Canal construction, Failure (Mechanics), Canals, Judicial decisions, Legal aspects, Fish farming.
Identifiers: *Negligence.

Plaintiffs owned land along a certain creek. Plaintiffs controlled the entry of water from the creek into a ravine, in which they raised carp, by operation of a weir. Defendant dredging company deposited large quantities of dredged earth along the creek near plaintiffs' tract of land and constructed an embankment to confine the excavated material. The embankment gave way sending large quantities of earth into the creek and cutting off access by water to plaintiffs' ravine. Plaintiffs sued for damages. The court acknowledged that although water in the creek was shallow and plaintiffs held no title to the creek bed below the high water mark, they were entitled as riparian proprietors to enjoy such floatage as the creek would provide. Deposits placed in the channel impeding its use were unlawful. However, the court gave judgment for defendant, holding that the mere happening of the accident did not prove negligence. The exercise of reasonable care could not have ascertained a defect in the embankment structure, and res ipsa loquitur did not apply since defendant was not shown to be at fault. Liability without fault did not apply since defendant did not own or occupy the site of the deposits. (Hubener-Florida)

CHAPMAN V DELK (LOSS OF MILL-DAM FLOODING EASEMENT DUE TO OPERATION OF STATUTE).

16 SE2d 379-383 (Va 1941).

Descriptors: *Virginia, *Easements, *Mill dams, *Flooding, Ponds, Confined water, Legal aspects, Judicial decision, Impounded waters, Water levels, Water level fluctuations, Surface waters, Dams, Water control, Eminent domain, Mills, Relative rights, Legislation, Compensation, Lakes, Land tenure, Real property.
Identifiers: Statutes of limitation.

The complainants owned land adjacent to a mill pond. The defendant held an easement to flood lands above a dam on the pond. After the mill had been out of use for forty years, the defendant sought to raise the level of the pond by five feet and to further flood the land of the complainants. Complainants sued to terminate the defendant's right to do so. The mill pond, a dam and grist mill had been developed between 1836 and 1856 pursuant to a

tate statute. The statute provided that under cer-ain conditions private property could be taken to establish a grist mill. A forfeiture provision of the tatute stated that if the mill were destroyed or endered useless, and repairs not begun within two ears, the title to the land would revert to the riginal owner, their heirs or assigns. The appellate ourt held that as the mill had been abandoned for orty years, the title reverted to the original owners nd the easement to flood lands extinguished. Price-Florida)
W70-08264

COGSDALE V HOWARD (DISPUTE TO TITLE OF POND).

95 SE 514-516 (Va 1938).

Descriptors: *Virginia, *Beds under water, Ownership of beds, *Easements, Lake beds, Land enure, Boundaries (Property), High water mark, Legal aspects, Lakes, Boundary disputes, Mill lams, Artificial use, Real property, Judicial deci-ions, Relative rights, Prescriptive rights, Mills, Ponds.

Plaintiff and defendant disputed ownership of a millpond. Plaintiff owned a grist mill and mill dam situated on the pond, and claimed the pond on the basis of words in the deed from his grantor which allegedly conveyed to him the real estate 'being the same purchased by grantor.' The grantor had purchased title to the pond but the pond was not specifically mentioned or described in the deed of conveyance. Defendants claimed ownership of the pond as heirs at law of the grantor. The court held for defendants stating that plaintiff had never acquired title to the mill pond either by purchase or adverse possession. The 250 acre pond was not appurtenent to the grist mill or to plaintiff's small tract of land. Plaintiff held only an easement in the water of the pond for the purpose of operating the grist mill. (Hubener-Florida)

SUTTON V TERRETT (ACCRETIONS AS INCIDENT TO RIPARIAN OWNERS WHOSE GRANT RUNS ONLY TO STREAM BANK).
301 Ky 506, 192 SW2d 382-385 (Ky 1946).

Descriptors: *Kentucky, *Accretion (Legal aspects), *Boundary disputes, *Boundaries (Property), Riparian rights, Judicial decisions, Legal aspects, Water law, Bank erosion, Acreage, Alluvial channels, Navigable waters, Streams, Ownership of beds, Riparian land, Rivers, Mississippi River, Channels, Relative rights, Land tenure, Real Property.

Twenty-one years prior to this action, a homestead which bordered on the south bank of a dual-channeled river was divided into seven tracts. The tracts were allotted to seven of nine heirs of the deceased owner. Subsequent to this division, the south channel of the river shifted north, causing land to accrete to the south bank, Plaintiffs, three heirs of the deceased (two of which had not participated in the earlier division), brought action to force the sale of the accreted land. Deed descriptions in the grant of the seven tracts ran only to the bank of the stream, and plaintiffs contended that the accreted and did not therefore affix to the original tracts. Plaintiffs argued that each of the nine heirs owned an undivided one-ninth interest in the accreted and. The lower court so held. In reversing, the appellate court held that, generally, where a line of a grant runs to the bank of a stream and along the stream or the bank, the grant extends to the thread of the stream. Unless the description clearly excludes the space between the bank and the stream thread, all accretions belong to the riparian owner. Consequently, the seven heirs who received land along the river were entitled to the additional land which accreted to their respective tracts. (Marsee-Florida)

HOLYOKE WATER POWER CO V WHITTING AND CO (RESPECTIVE RIGHTS IN STREAM).
276 Mass 528, 177 NE 568-574 (1931).

Descriptors: *Massachusetts, *Mills, *Water users, *Water distribution (Applied), Judicial decisions, Legal aspects, Power head, Hydraulic structures, Water works, Canals, Pipes, Water conveyance, Water supply, Water demand, Flumes, Cavitation, Diversion structures, Dams, Riparian rights, Waterfalls, Water wheels, Diversion.

This dispute arose between plaintiff and defendant over their respective rights to the use of water and water power developed from a waterfall in the Connecticut River. Plaintiff was the owner of a hydraulic system which created water power for manufacturing purposes to be sold or leased to corporations such as defendant. Defendant was the grantee of a mill site with appurtenant water power privileges. Plaintiff alleged that defendant abused such privilege by using more than its alloted mill power and by diverting certain waters in excess of that allowed. The court held for plaintiff, and found defendant had abused its rights in the water without authority. (Barnett-Florida)
W70-08370

BIXBY V BACKUES (OWNERSHIP OF ACCRETED LANDS).
144 SW2d 112-115 (Mo 1940).

Descriptors: *Missouri, *Accretion (Legal aspects), *Boundaries (Property), *Banks, Judicial decisions, Legal aspects, Meanders, River beds, Surveys, Boundary disputes, Patents, Riparian rights, Shores, Coasts, Alteration of flow, Diversion, Relative rights, Real property.

Deeds were entered into evidence by plaintiff which purported to convey certain lands east of the Gasconade River. A controversy arose over ownership of the land evidenced in those deeds. These lands consisted of a three acre tract which was created by a change in the river's course. This change in direction was proven to be slow, gradual and imperceptible, and the lands in controversy were found to be formed by accretion to the shore land. The court stated that, under Missouri law, such accreted land belongs to the owner of the shore land to which it attaches. The deed of the shore land to plaintiff did not contain any exceptions or reservations as to accretions. It therefore presumptively carried with it all accretions so formed. As to the land in controversy, the court found title to be in plaintiff as lands accreted to shore land in which plaintiff had good title. (Barnett-Florida)

THE NATIONAL WATER COMMISSION,
National Water Commission, Arlington, Va.
Theodore M. Schad.
Water and Wastes Engineering, Vol 6, No 8, p 38, August 1969.

Descriptors: *Water policy, Water quality, *Water resources development, Water law, *Planning, Institutions, *Organizations, Administrative agencies.

The goals and objectives, membership, staff and organization of the National Water Commission are presented. The seven man commission was established by Public Law 90-515 and is to undertake a five year study of water resource problems in the US, the purpose of which is to provide background for policy recommendations to guide the future activity in water related fields in the US. The information will be obtained by the commissions staff, from state and federal agencies, and private organizations. The studies will encompass many water-related areas. The commissions final report to the President and Congress is due September 1973. A listing of the commission members, key staff members, and special consultants is also included. (Makela-Texas)

STATE V HOLLAND (DIFFERENCE BETWEEN PUBLIC AND SOVEREIGN LAND).

10 So2d 577-592 (Fla 1942).

Descriptors: *Florida, *Ownership of beds, *Land classification, *Public lands, State governments, Local governments, Cities, Legal aspects, Judicial decisions, Legislation, Water law, Remedies, Regulation, Navigable waters, Classification, Land, Land use, Real property, Property values.

The State of Florida, on behalf of Crescent City, Florida, sought to compel the Trustees of the Internal Improvement Fund to convey certain lands to such city. Whether the city was to pay a nominal sum or a substantial price for these lands depended upon the determination of the issue of whether these lands were public lands or soverign lands. If designated as public lands, such realty would sell for a substantial sum, as opposed to the more nominally priced sovereign lands. The court stated that public lands are those which are owned by the state, subject to sale or disposition under general law, and those which have not been reserved for any partiuclar purpose. However, the court further noted that lands under navigable waters below the ordinary high water mark belong to the state, by virtue of its sovereignty for appropriate uses, and are not among the public lands of the state. The court held that the lands which were the subject of controversy were sovereign lands, which necessarily entailed conveyance for a nominal fee as authorized by state law. (Finman-Florida)

LAW V GULF STATES STEEL CO (DAM NOT THE PROXIMATE CAUSE OF UPLAND FLOODING).
175 So 322-326 (Ala Ct App 1937).

Descriptors: *Alabama, *Dams, *Flood damage, *Headwaters, Damages, Flash floods, Flooding, Overflow, Flood water, Judicial decisions, Floods, Backwater, Streams, Watersheds (Basins), Concrete dams, Structures, Crops, Legal aspects, Adjudication procedure, Water levels.
Identifiers: *Causation (Legal aspects).

In an action for damages, plaintiff contended that his crops were destroyed by backwater overflow from a creek dammed by defendant. Defendant contended that plaintiff's crops were damaged by a flood flowing from above and not impeded by the dam. Defendant argued that the headwaters rushing down the creek reached such a height that the crops would have been destroyed even if the dam had not existed. The appellate court held that evidence introduced to the jury for the purpose of showing the area's topography, elevations, and probable rise of water was properly admitted. The jury's determination that the dam was not a proximate cause of the destruction of plaintiff's crops was affirmed. (Snow-Florida)

WATER ADMINISTRATION--A SUGGESTED INSTITUTIONAL MODEL,
Nebraska Univ., Lincoln. Dept. of Agricultural Economics.
Clayton K. Yeutter.

Available from the Clearinghouse as PB-193 024, $3.00 in paper copy, $0.65 in microfiche. University of Nebraska, Department of Agricultural Economics Report No 46, December 1968. 30 p, 74 ref. OWRR Project No A-008-NEB.

Descriptors: *Institutions, *Administration, *Water resources development, Institutional constraints, Political aspects, Decision making, Local governments.
Identifiers: *Water administration, *Institutional model, Water resources board, Comprehensive water plan, Externalities, Proctored market, Local water administrative agencies.

An institutional model for water administration is described which attempts to provide a basic, general framework of almost universal applicability, through the provision of the skeletal components of a water code featuring simplicity, flexibility, and localized responsibility. This institutional proposal is pyramidal in approach. At the peak is a Water Resources Board that will: (1) develop a comprehensive water plan for the state; (2) make broad policy decisions in both planning and administrationp (3) deal with water problems that are state-wide in scope; and (4) coordinate the activities of local water administrative agencies. Local organizations form the base, including streamflow, groundwater, and reservoir districts and with various combinations thereof. This institutional model might be considered a 'proctored market' model whose institutional model might be considered a 'proctored market' model whose intent is to: (1) permit most, but not all, water allocation decisions to be made by the market; (2) proctor, alter, or pre-empt the market only with respect to functions that the market cannot satisfactorily perform; and (3) localize non-market decision-making responsibilities whenever feasible. The market will not, however, resolve all the ills of water administration, hence, the need for centralized agencies designed to cope with these 'externalities'. (See also W69-08115) (Davis-Chicago)

THE RIO GRANDE COMPACT,
S. E. Reynolds.
In: International Law Along the Mexican, American Border, No 11, Committee on Desert and Arid Zones Research, Southwestern and Rocky Mountain Division, A.A.A.S., p 48-64, 1968.

Descriptors: *Rio Grande, *New Mexico, *Federal jurisdiction, Surface waters, Groundwater, Dams, Reservoirs, Texas, Colorado, Irrigation canals, Irrigation districts, Irrigation permits.
Identifiers: *Federal legislation, *U.S. Supreme Court, *Rio Grande Compact, *Interstate compacts, *Doctrine of equitable apportionment, Debit water, Elephant Butte Reservoir, Rio Grande Valley

In adjudicating interstate water controversies, the U.S. Supreme Court applies the doctrine of equitable apportionment between upstream and downstream western states. A number of other economic and social factors are also involved in the Court's deliberations and the bases of decisions may be extremely involved. Alternatively, such controversies may be resolved by federal legislation throught the creation of water compacts. It is generally agreed that compacting best resolves interstate water controversies. The Rio Grande Compact of 1938 effectively established requirements and standards for the apportionment of Rio Grande Waters between New Mexico, Colorado and Texas. Three generally misunderstood aspects of the Compact are clarified. (1) The amount of water delivered between states in any given year is determined by water gauges at each supply level (2) The Compact does not effectively apportion water between New Mexico and Texas but between 2 parts of New Mexico (3) Accrued water debits do not reflect New Mexico's contributions because much of it was temporarily created by long-term water supply improvement projects within the state (Casey Arizona)

HITE V TOWN OF LURAY (CONSTRUCTION OF DEEDS AND ASCERTAINMENT OF WATER RIGHTS).

8 SE2d 369-373 (Va 1940).

Descriptors: *Virginia, *Springs, *Water users, *Patents, Cities, Legal aspects, Judicial decisions, Reasonable use, Alteration of flow, Municipal water, Natural flow doctrine, Obstruction to flow, Relative rights, Prior appropriation, Damages, Riparian rights, Riparian land, Riparian waters, Streams, Mills, Saw mills, Pipes, Easements, Condemnation, Public health.

Plaintiff city brought suit for the construction of certain deeds to determine what rights it had acquired in and to certain springs and the waters flowing therefrom. Certain mesne conveyances were examined which conveyed the property in question but which reserved certain water rights in the original grantor. The court concluded that plaintiff owned a property right in all the water in the spring except so much as was reserved in the original conveyances by the grantor, including: (1) the right to withdraw from the spring specified amounts of water; and (2) the right to the use of so much of the water flowing from the spring as might be necessary to meet the ordinary needs of the owner of the lands through which it passes. Those rights and privileges granted and reserved were found to be appurtenant to and running as covenants with the land as granted in the original conveyance. (Barnett-Florida)

EMERGING LEGAL STRATEGIES: JUDICIAL INTERVENTION,
Michigan Univ., Ann Arbor.
Joseph L. Sax.
The Annals of the American Academy of Political and Social Science, Vol. 389, May 1970, p 71-76. 8 ref.

Descriptors: *Legal aspects, Management, Natural resources, Attitudes, Social values, Decision making.
Identifiers: *Legal strategy, *Judicial intervention, Environmental litigation, Policy.

Citizen-initiated environmental litigation is a response to the inability of traditional administrative agencies to accommodate to newly recognized ecological perspectives in the management of natural resources. Old-line agencies, freighted by singled-mindedness, a particular sense of mission and alignment with limited constituencies, are often unequal to the broadened perspectives which modern legislation and new public attitudes demand of them. Consequently, important policy decisions are undermined or distorted. Judicial assistance is sought to return important policy decisions to a forum in which democratic processes work more effectively. One such incipient technique is the judicial 'remand' of administrative action to the legislatures. (Davis-Chicago)

ENVIRONMENTAL PROBLEMS AND LEGISLATIVE RESPONSES,
National Air Pollution Control Administration, Arlington, Va.
Jack C. Oppenheimer, and Leonard A. Miller.
Annals of the American Academy of Political and Social Science, Vol. 389, May, 1970, p 77-86. 1 tab 25 ref.

Descriptors: *Legislation, *Environmental, Conservation, Inter-agency cooperation, Administration, Management, Institutional constraints.
Identifiers: *Environmental policy, *Environmental problems.

No one national legislative policy on environmental problems emerged from the Congress at the end of 1969. Congress has reacted to environmental problems in much the same manner in which it has reacted to urban-industrial problems: it has reacted to crises. Legislative assessment of environmental problems from the late 1940's to the present arose out of, but suffers from, that of earlier legislative conservationists. Early 'conservationists' sought primarily the preservation, development, and use of natural resources. Contemporary 'environmentalists', however, are chiefly concerned with the protection and quality of man-made and natural environments for human health and welfare. The legislative environmentalists are working toward the protection of the quality of human life in an urbanized society from all sources of pollution. Some legislation has been passed for programs of research and development; for technical and financial assistance to states and localities, for federal action when other governmental levels fail to act; and for the elimination of some water, air, solid waste, noise and pesticide pollution. Numerous congressional committees and their executive-agency counterparts have become involved in making and administering multiple environmental policies which, at times, overlap or are in conflict. All this has given use to executive and legislative action to coordinate and unify environmental policies, plans, and programs. (Davis-Chicago)
W70-08545

GILL V HEDGECOCK (BOUNDARY DISPUTE AS TO RIPARIAN LANDS ON NON-NAVIGABLE STREAM).

184 SW2d 262-264 (Ark 1944).

Descriptors: *Arkansas, *Boundary disputes, *Non-navigable waters, *Riparian land, Accretion (Legal aspects), Judicial decisions, Legal aspects, Streams, Rivers, Riparian rights, Banks, Watercourses (Legal), Land tenure, Sand pits, Gravels, Boundaries (Property), Excavation, Relative rights, Adjudication procedure, Compensation, Sands, Ownership of beds.

A non-navigable stream operated as a boundary between appellant's and appellee's lands. A sand and gravel developer, who had been removing and selling sand and gravel from the bed of the stream, originated this interpleader action to determine the boundary line between appellant's and appellee's lands and the amount of compensation due each for the sand and gravel taken from their respective lands. Appellants contended that the boundary line should be a line running in the stream equi-distant from high bank to high bank. Appellees contended that they owned the entire bed of the stream. The lower court rejected both contentions and held that the boundary was the middle thread of the stream. The appellate court affirmed holding that both appellant and appellee were riparian owners, notwithstanding the fact that appellant's lands were described in his deed as lying north of the river. The presumption is that the boundary line between riparian lands on a non-navigable stream is the middle thread of the watercourse. (Marsee-Florida)

STATE V AUCOIN (RIPARIAN RIGHTS TO THE BEDS OF NAVIGABLE LAKES).
20 So 2d 136-165 (La 1944).

Descriptors: *Louisiana, *Boundaries (Property), *Boundary disputes, *Ownership of beds, Drainage districts, Judicial decisions, Land tenure, Legal aspects, Legislation, Public rights, Relative rights, Riparian land, Riparian rights, Riparian waters, Prescriptive rights, State governments, Usufructuary right, Watercourses (Legal), High water mark, Navigable waters, Accretion (Legal aspects).

An early government survey had extended the boundary line of several sections across the high

ater mark of a navigable lake. Because of artifi-al drainage, the lake had shrunk to the point here such boundary line was no longer traversing ibmerged lands within the sections. Defendant ırchased lands described in his deed as including l of these several sections. However, prior deeds defendant's chain of title had described the land including only fractional sections, the boundary nning to the edge of the lake. Plaintiff state aimed title as the sovereign to all lands included the original government survey as part of the ke bed. Defendant claimed that, by his deed, he ıd acquired title to the land which had previously een under water since his deed was for complete ctions and not fractional sections as were the eeds of his predecessors in title. In the alternative, claimed: (1) that he had acquired a prescriptive ght to the dried up portion of the lake bed; and 2) that he acquired such land by accretion. The ourt held that prescription did not run against the ate. Furthermore, regardless of descriptions in eeds, beds of navigable lakes belong to the state, nd original boundaries thereof designated by overnment surveys are controlling. Finally, statu-ry rights to accreted land do not apply to land ad-cent to a lake where the lake has diminished in ze. (Clarke-Florida)

ANRAHAN V CORROU (ACTION TO ESTRAIN CITY'S PURCHASE OF WATER OMPANY'S PROPERTY AND FRANCHISE).
70 Misc 922, 12 NYS2d 536-544 (Sup Ct 1938).

escriptors: *New York, *Cities, *Waterworks, Administrative decisions, Water supply, Reser-oirs, Pumping, Pipelines, Sewers, Judicial deci-ons, Legal aspects, Public benefits, Taxes, Water emand, Legilation, Administrative agencies, Utili-es, Water loss, Leakage, Municipal water, Financ-ng, Adjudication procedure, Remedies, Supervisо-y control (Power), Legislation.

Defendant city investigated the advisability of urchasing the property of a water company which upplied the city with water. An appointed commit-ee recommended to the city that its best interest ould be served by the purchase of such property f the water company as was used or useful for ater purposes. Plaintiff taxpayer brought suit to estrain such purchase, alleging that it would be il-egal and a waste of public funds. Plaintiff also al-eged that the purchase would be unreasonable in hat much of the company's property was useless nd obsolete and would require further large ex-enditures for renewals and replacements of exist-ng sewer lines and water mains. The court held hat the purchase was valid in that the legislature, hen it authorized the court to hear a taxpayer's uit to restrain waste by municipal officials, had not iven the court the power to sit in judgment upon uestions of administrative discretion. The statute llowed administrative discretion in dealing with evenue-producing municipal undertakings, includ-ng instrumentalities and properties used or useful n connection with obtaining a water supply. In ight of a presumption that it was made in good aith, and absent a rebutal showing otherwise, the ourt would not pass upon the wisdom of the urchase. (Barnett-Florida)
W70-08554

TENNECO INC V OCAW, LOCAL NO 4-522 INJUCTION TO PROHIBIT PUBLIC USE OF LEVEE).
234 So 2d 246-250 (La Ct App 1970).

Descriptors: *Louisiana, *Levees, *Labor unions, *Public rights, Reasonable use, Streams, Navigable rivers, Mississippi River, Usufructuary right, Public benefits, Labor, Banks, Wages, Judicial decisions, Legal aspects, Riparian rights, Riparian land, Legislation, Relative rights, Navigation, Rivers.
Identifiers: *Servitudes.

Defendant union, in connection with a strike against plaintiff employer, picketed upon plaintiff's land adjacent to the Mississippi River. Plaintiff sought to enjoin the picketing, and the lower court prohibited any picketing that obstructed free ingress and egress to plaintiff's property. However, the injunction excepted from its prohibition that part of plaintiff's property which constituted the levee of the river. Plaintiff appealed the judgment contending that picketing on the levee of a navigable stream in furtherance of a labor dispute was not a public use so as to be allowable by law. Defendant argued that picketing was within the scope of uses which public servitude imposed on riparian owners pursuant to the Louisiana Code. The appellate court held that the character of the servitude imposed by law was not for the public at large, but was only for such use as was incident to commerce or navigation on the river. The picketing on the levee was unlawful and prohibited. (Barnett-Florida)

MINNESOTA WATER RESOURCES BD V COUNTY OF TRAVERSE (ADMINISTRATIVE AGENCY'S STANDING IN JUDICIAL REVIEW OF ITS OWN DECISIONS).

177 NW2d 44-48 (Minn 1970).

Descriptors: *Minnesota, *Watershed management, *Administrative decisions, *Adjudication procedure, Administrative agencies, State governments, Judicial decisions, Water resources, Water law, Boundary disputes, Water resources development, Public rights, Legal aspects, Local governments.

Plaintiff property owners and county commissioners initiated proceedings before defendant state Water Resources Board to establish a county watershed district. Defendant established a watershed district, but upon plaintiffs' appeal the district court modified the watershed boundaries. Defendant then sought appellate review of the district court's judgment. Plaintiffs contended that defendant had no standing to appeal because it was essentially a judicial tribunal rather than an administrative agency and therefore not an aggrieved party. Defendant contended that it was more than an arbiter because it had authority to establish watershed districts, a non-judicial function, and that it also functioned to protect the interests of the public. Finding that the public interest was adequately represented by interested state agencies and conservation groups, the court held that defendant was essentially a quasi-judicial body rather than an administrative agency and therefore had no standing in a judicial review of its own decision. Consequently, the appeal was dismissed. (Liptak-Florida)

GLOBE V LOUISVILLE AND N R R (PRESCRIPTIVE EASEMENT TO FLOOD LANDS).
200 SE 259-268 (Ga 1938).

Descriptors: *Georgia, *Obstruction to flow, *Easements, *Prescriptive rights, Alteration of flow, Downstream, Natural flow, Non-navigable waters, Rainfall-runoff relationships, Legal aspects, Judicial decisions, Condemnation, Legislation, Natural flow doctrine, Riparian land, Riparian rights, Riparian waters, Watercourses (Legal), Bridge construction, Repairing, Impounded waters, Excessive precipation, Dams.
Identifiers: *Trestles (Railroad).

Plaintiff owned land below a trestle built by defendant railroad. The trestle spanned a stream which flowed through plaintiff's property. The trestle collected debris and during heavy rains dammed the stream. This embankment then broke and released the impounded water onto plaintiff's property. Plaintiff asked damages and sought to enjoin the reconstruction of the trestle to its original condition. Defendant contended that, because it had maintained the trestle for twenty-five years, it had acquired a prescriptive right to flood plaintiff's land. The appellate court held that defendant had not acquired such right. The flooding had not been continuous and uninterrupted for the required period. A riparian landowner is entitled to have water reach his land in its natural flow. The obstruction thereof so as to cause it to overflow or injure his land is a trespass. Moreover, to wrongfully turn water onto the land of another is a nuisance. If the proximate cause of the overflow was defendant's failure to properly maintain the trestle, thereby rendering it incapable of accommodating the water during heavy rains, the existence of unusual rainfall did not relieve it of liability. The order dismissing the complaint was reversed. (Price-Florida)

SMITH V WALLACE (TITLE TO ACCRETED LAND).

119 SW2d 813-820 (Mo 1938).

Descriptors: *Missouri, *Missouri River, *Accretion (Legal aspects), *Land tenure, Rivers, Running waters, Surface waters, Channels, Natural flow, Channel flow, Boundaries (Property), Relative rights, Islands, Judicial decisions, Water law, Channel morphology, Legal aspects.

Plaintiff, record title owner of an island in the Missouri River, sought ejectment of defendants from the island. Subsequent to plaintiff's purchase of the island, through a process of erosion and accretion, the island was greatly enlarged on the downstream end so that it extended until it reached an island owned by defendants, while the upstream portion was eroded to the point that none of the island in question was included within the boundaries described in plaintiff's record title. Plaintiff claimed title to the accreted land through adverse possession. Defendants claimed that plaintiff had no interest in the accreted land and thus no interest in the island in question since it was completely beyond the boundaries of his original purchase. The Supreme Court of Missouri ruled that a landowner, be his interest derived from record title or adverse possession, is entitled to ownership of accreted land. However, the court ruled that the questions of adverse possession and actual accretion must be determined by the jury, and since the jury in the trial court had been improperly instructed as to these issues, the judgment for plaintiff was reversed. (Barker-Florida)

SMITH V ARKANSAS IRRIGATION CO (STATE DELEGATION OF POWER OF EMINENT DOMAIN).
142 SW2d 509-511 (Ark 1940).

Descriptors: *Arkansas, *Condemnation, *Eminent domain, *Public benefits, Boundaries (Property), Judicial decisions, Land tenure, Legal aspects, Legislation, Proprietary power, Relative rights, State governments, Water rights, Wells, Dams, Irrigation, Irrigation water, Compensation, Adjudication procedure.
Identifiers: *Public purpose.

An Arkansas statute granted the power of eminent domain to irrigation corporations. Plaintiff irrigation corporation condemned 120 acres of defendant's land. The lands condemned were contigious to a bayou across which plaintiff proposed to construct a dam to impound water for the irrigation of rice fields. The only question on appeal was the right to condemn. The court held that the mandates of due process are satisfied if the purpose for which land is condemned is public and if the owner of the land receives just compensation. Once this is judicially determined, the legislative policy is left supreme. Evidence in this case showed that rice farming was the principal activity in the area and that an abundant supply of water suitable for irrigation was essential. Therefore, the public purpose requirement was thereby fulfilled, and the trial

court's judgment for plaintiff affirmed. (Clarke-Florida)

STONUM V DAVIS (PASSAGE OF TITLE TO SWAMPLAND BY GRANTS AND PATENTS).

152 SW2d 1067-1072 (Mo 1941).

Descriptors: *Missouri, *Patents, *Swamps, *Federal government, State governments, Grants, Judicial decisions, Legal aspects, United States, Land tenure, Overflow, Rivers, Levees, Relative rights, Land use, Real property, Drainage, Land management, Surveys, Taxes.
Identifiers: *Adverse possession.

Plaintiff, record-title holder of the disputed lands, instituted an action to quiet title against defendant, who claimed title to such lands by adverse possession. The lands involved were overflowed swamplands which had passed from the United States to the state of Missouri under a grant taking effect in praesenti in 1850, and thereafter granted by statute from the state to the counties in 1896. Defendant went into possession in 1926 and held the lands in adverse possession against all persons. The United States issued a patent of these lands to the state in 1933 and the state issued its patent of these lands to the counties in 1934. Plaintiff alleged that the time elapsed between defendant's entry into possession and the date of issuance of the government's patents could not be included in determining the period of adverse possession since adverse possession first begins to run when the fee simple title passes out of the government. The court, in affirming the trial court's judgment for defendant, held that when defendant entered into possession the United States and the state had no interest in the lands since they had previously granted away such interest. The patents in 1933 and 1934 were merely deeds of further assurance as muniments of title declaratory of the title passing in the previous grants. (Barnett-Florida)
W70-08576

HARTVEDT V HARPST (LEGAL DESCRIPTION OF ISLANDS ENLARGED BY ACCRETION).

173 SW2d 65-70 (Mo 1943).

Descriptors: *Missouri, *Boundaries (Property), *Accretion (Legal aspects), *Islands, Boundary disputes, Judicial decisions, Land tenure, Legal aspects, Proprietary power, Relative rights, Riparian land, Riparian rights, Riparian waters, Usufructuary right, Watercourses (Legal), Banks, Navigable waters, Avulsion, Low water mark, Rivers.

In an action to quiet title, plaintiff appealed from an order granting defendant's motion to make his petition more definite and certain. The land in question was an island in the Missouri River. Plaintiff's description thereof consisted of a statement of the approximate size in acres and the approximate location by section and township. Plaintiff claimed title to the waters edge of all of said island, which had been considerably enlarged by the process of accretion. Defendant claimed that the description of the island, without reference to metes and bounds, was so vague, uncertain and indefinite as to render identification impossible. The court stated that a riparian proprietor on a navigable stream owns to the water's edge, which may be figured at and to the low water mark. The court then held that the description in plaintiff's petition was clear, definite and certain enough that there was no reasonable basis upon which the trial court could say that defendant was not advised of the precise real estate claimed by plaintiff. (Clarke-Florida)
W70-08578

TAYLOR V COLLINS (NATURAL WATERCOURSE AS A BOUNDARY LINE).
299 Ky 290, 185 SW2d 388-389 (1945).

Descriptors: *Kentucky, *Boundaries (Property), *Meanders, *Boundary disputes, Alteration of flow, Judicial decisions, Legal aspects, Real property, Land tenure, Obstruction to flow, Erosion, Streambeds, Ownership of beds, Streams, Drains, Diversion, Relative rights.

A controversy arose out of a dispute as to the location of the dividing line between two tracts of land. Appellant's deed identified the common boundary between the tracts as a straight line between a rock and a tree while appellee's deed cited the meanders of a stream as the dividing line. Appellant alleged that appellee had altered the flow of the stream, thus causing it to flow over his lands. The lower court found that the true line between the property of the parties ran with the meanders of the stream as it flowed at the time of trial, and enjoined any alteration of the flow of the stream. On appeal, appellant insisted that it was the intention of the parties' common grantor that the description in his deed be the dividing line. The court, in affirming, held that even if appellant's construction of the description in his deed was accepted, it would conflict with the recognized natural object, the creek. Under the applicable law of construction of deeds, the straight line boundary appellant urged had to yeild to the natural object boundary. (Barnett-Florida)
W70-08579

HARRIS V GRAY (RIGHT OF ACCESS TO PUBLIC ROADS).
188 SW2d 933-936 (Tenn Ct App 1945).

Descriptors: *Tennessee, *Easements, *Rivers, *Access routes, Boundaries (Property), Right-of-way, Legal aspects, Judicial decisions, Washouts, Banks, Riparian land, Roads, Streams, Relative rights.

Plaintiff owned a tract of land bounded by an uncrossable stream on one side and defendant's land on the others. Plaintiff had at one time owned the lands occupied by defendant. Plaintiff filed a bill to set up an easement of way from his land over defendant's land to allow access to a public road. The lower court held that plaintiff was entitled to an easement over defendant's land to the public road upon the theory of implied reservation based upon necessity. On appeal the court held that the rule of 'absolute necessity' did not apply in Tennessee. But by reason of all the facts, including evidence of the inability of plaintiff to otherwise cross the stream, the court found an easement arose in plaintiff's favor by reason of the fact that it was reasonably necessary to the full enjoyment of the plaintiff's land. The court held that an implied reservation of an easement for access was presumed to have been within the contemplation of the parties at the time of conveyance. (Barnett-Florida)
W70-08580

KEMP V OWEGO WATER WORKS (WATER RIGHTS IN PERPETUITY CREATED BY WATER WORK'S DESTRUCTION OF SPRING ON GRANTOR'S LAND).
45 NYS2d 794-795 (App Div 1944).

Descriptors: *New York, *Water supply, *Land tenure, *Water works, Reservoirs, Spring waters, Springs, Real property, Judicial decisions, Legal aspects, Relative rights, Water rates, Water rights, Compensation, Damages, Potable water, Water demand
Identifiers: *Injunctions.

Plaintiffs brought action to enjoin defendant water works from shutting off water furnished to their premises. Both plaintiffs' and defendant's land had at one time been held by a common grantor. In conveying land to the water works, the grantor had provided that, if the water works should destroy a spring situated on the grantor's retained land, it should furnish the grantor and her heirs forever, from its water works, an amount of water equal to that supplied by the spring. The spring was destroyed when defendant constructed its reservoir, and for over 40 years defendant supplied water free of charge to successive owners of the land. When defendant notified plaintiffs that they must pay for future water, plaintiffs brought action. Defendant contended that the language of the deed from the grantor created only a condition subsequent and that the right to take advantage of the breach of the condition did not pass beyond the heirs of the grantor. The trial court rejected this contention finding that the deed created a covenant running with the land. Such covenant entitled the lands' owners to free water in perpetuity. The appellate court affirmed per curiam. (Marsee-Florida)

he National Flood Insurance Act of 1968 became ffective on Jan 28, 1969, and provides for sub-dized flood insurance and a cooperative program n which the Federal Government and the private nsurance industry share flood risks. The statute al-ows 5 yr (from Aug 1, 1968) to identify all flood lain areas having special flood hazards and 15 yr o establish flood risk zones in all such areas, and to nake estimates of rates of probable flood-caused oss for the various risk zones. Flood plain areas aving special flood hazards are identified by publi-ation with map reference in the Federal Register. Any structure erected after the date of such publi-ation is not eligible for subsidized insurance. Eligi-ility for the insurance requires an expression of ositive interest and satisfactory assurances of in-erest by a community or county to comply with the and use requirements of the statute. An important urpose of the program is to encourage state and ocal governments to make appropriate land use djustments to constrict land development exposed o flood damage. Initially, the insurance is available nly for 1- to 4-family residential structures and heir contents; studies are underway to extend the rogram to other kinds of properties. (USBR)

6G. Ecologic Impact of Water Development

CLIMATE, SURVIVAL AND THE SECOND-CLASS SOCIETIES IN PALESTINE BEFORE 3000 B. C.,
Balliol Coll., Oxford (England).
Ian Blake.
Advancement of Science, Vol 25, No 126, p 409-421, June 1969.

Descriptors: *Social change, *Water demand, *History, *Precipitation (Atmospheric), *Climatic data, Arid lands, Population, Competition, Migration, Urban sociology, Social impact.
Identifiers: *Palestine, *Archaeology, *Jordan valley.

Modern-day Palestine (Israel-Jordan) is divided into 4 climatic regions: (1) A northern moist area of 400 mm annual rainfall (2) Jordan Valley - a geomorphological depression with no rainfall but many springs and therefore fertile (3) A barren southern arid region of less than 150 mm annual rainfall (4) A marginal region in the transition area between arid and moist areas. The author contends that only very slight climatic changes could cause great changes in the productivity of the marginal region. A Pre-Pottery Neolithic society (PPN) with sophisticated tools and building structures existed throughout the 3 wetter regions from 7000-6000 B.C. and there after completely disappeared. After 5000 B.C. it was succeeded, successively, by 3 Pottery Neolithic Societies (PNi, PNii, and PNiii) of generally lesser technical sophistication. There is some evidence for middle eastern rainfall maxima in 7000, 5000, and 3000 B.C., which correlates with the origins of PPN and PNi and the peak of PNiii. PNi and PNii occupied only the moist, fertile regions, PNiii extended into the marginal region but withdrew after the onset of a new arid period around 2500 B.C. Significantly however it did not collapse, following the withdrawal as did the PPN society. It is speculated that PNiii had developed walled towns, enabling the moister regions to withstand mass migrations from the rainfall-impoverished areas, and that such climatic factors, causing upheavals, may have been significant factors in human social progress. Descriptors: *Turbulence, *Measurement, *Instrumentation, Pressure, Frequency analysis, Vortices, Turbulent flow, Flowmeters, Current meters, Calibrations, Gages.
Identifiers: Turbulence meters.

The performance of an instrument capable of a flat response to total pressure fluctuations in water in the frequency range 0-250 Hz is demonstrated. Measurements of turbulence in open channels and closed conduits were made as well as in boundary layers adjacent to smooth and various rough walls. When compared with hot wire measurements in air by others the performance of the instrument proved very reliable for such turbulence measurements. A design equation is presented in a form suitable for application to commercially available pressure transducers. The natural frequency estimated by this equation agrees reasonably well with the experimentally determined response. Estimates of accuracy are presented and limitations on the use of such an instrument are discussed. (Knapp-USGS)

Descriptors: *Roughness (Hydraulic), *Turbulent flow, *Shear drag, *Measurement, Instrumentation, Shear stress, Boundary processes, Pressure, Flow resistance, Boundaries (Surfaces).
Identifiers: Rough flow (Hydraulic).

In experimental hydrodynamics, methods are needed to determine shear stresses on the walls. Typical examples are all the problems on movable beds, such as critical drag of sediments, side slope stability, and scour in erodible channels. All these cases of practical interest belong to the field of hydraulically rough flow. A new method for measuring shear stress in hydraulically rough flow is evaluated. The method proposed might be applied on circular pipes, rectangular channels and plane plates with boundary layers of any thickness, since the velocity distribution law in hydraulically rough flow is the same in the three cases. It is based on the accomplishment of three measurements by means of an impact tube in the vicinities of the wall. By these three measurements and with no need of a previous determination of the roughness, it is possible to obtain the value of the shear stress on the wall and the value of Nikuradze's roughness equivalent to the given roughness.

COMPARISON OF A PROPELLER FLOWMETER WITH A HOT-FILM ANEMOMETER IN MEASURING TURBULENCE IN MOVABLE-BOUNDARY OPEN-CHANNEL FLOWS,
Geological Survey, Fort Collins, Colo.
J. P. Bennett, and R. S. McQuivey.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402 - Price $3.25. In: Geological Survey Research 1970, Chapter B, US Geological Survey Professional Paper 700-B, p B254-B262, 1970. 9 p, 9 fig, 1 tab, 4 ref.

Descriptors: *Turbulence, *Flowmeters, *Anemometers, Current meters, Water measurement, Flow measurement, Rotating meters, Instrumentation, Calibrations.
Identifiers: Turbulence meters.

The hot-film anemometer may be used in measuring turbulence in large-scale movable-boundary open-channel flows if a correction is made for the drift of the velocity-voltage relation of the sensor. The propeller flowmeter may be used for making turbulence measurements in such flows if corrections are made for the frequency response and spatial averaging of the propeller. For each instrument the true power spectral density of the turbulence velocity may be calculated. Measurements of turbulence intensity and power spectral density were made with both hotfilm anemometer and propeller flowmeter in large-scale openchannel flows. The power spectral densities from the instruments are similar in shape except at the higher frequencies where effects of propeller spatial averaging appear. The efficiency of the propeller flowmeter as a device for measuring turbulence increases as the scale of the turbulence increases. (Knapp-USGS)

William M. Adams, Surendra P. Mathur, and Richie D. Huber.
Available from the Clearinghouse as PB-192 807, $3.00 in paper copy, $0.65 in microfiche. Technical Report No. 28, February 1970. 62p, 11 tab, 28 fig, 15 ref, 2 append. OWRR Project B-008-HI (3).

Descriptors: *Resistivity, *Gravity studies, *Groundwater barriers, Rift zone, Cinder hills, Dikes, Infrared radiation, Borehole geophysics, Hawaii, Geophysics, Exploration.
Identifiers: Pahala (Hawaii), Punaluu (Hawaii), *Aeromagnetic exploration, Rift zone, Cinder hills.

Aeromagnetic, electrical resistivity, and gravity surveys were conducted in the area between Pahala and Punaluu, Hawaii to delineate barriers to groundwater movement. The geophysical data are interpreted and compared to determine the sectors of relatively low gradient groundwater between the barriers. In the Pahala area, two barriers to lateral groundwater movement have been located: the Kolea barrier, which trends roughly east to west, and the second barrier, associated with a 'crack' used as the Pahala dump, designated by this study as the Pahala dump barrier. The Pahala dump barrier definitely appears to terminate at the Kolea barrier. These barriers are defined by magnetic, gravity, and electrical sounding and profiling observations. In the Punaluu area, electrical sounding and profiling observations agree with the conclusions of an earlier infra-red study that a large freshwater outflow, associated with a relatively high head of the water table, occurs. Magnetic and gravity observations agree on the presence of a skewed prismatic body with the top of the body being close to the ground surface. Two test holes have been drilled in the area. The findings verify the geophysical predictions. (Adams-University of Hawaii)

FLOODS ON ROCK RIVER IN NORTHERN ROCK COUNTY, WISCONSIN,
Geological Survey, Washington, D.C.
James O. Shearman.
For sale by US Geol Survey, Washington, DC - Price $0.75. US Geological Survey Hydrologic Investigations Atlas HA-393, 1 sheet, 1970. Text, 7 fig, 1 map, 4 tab, 4 tab, 7 ref.

Descriptors: *Floods, *Wisconsin, Profiles, Maps, Frequency analysis, Stage-discharge relations, Discharge (Water), Flood plains, Lakes, Rivers, Streamflow, Zoning, Flood plain zoning, Nonstructural alternatives.
Identifiers: *Rock River (Wisc).

A one sheet Hydrologic Atlas discusses a 12-mile reach of the Rock River from a point 2.3 miles upstream from U.S. Highway 14 to the outlet of Lake Koshkonong. It describes potential Rock River flooding in Rock County, Wisconsin. The maximum flood for the period of record at each of 5 stream-gaging stations in the Rock River basin is tabulated. Flood frequencies are stated in terms of their recurrence intervals or in terms of their probabilities of occurrence. The regional-flood profile and the flooded area that would exist at the time of the regional-flood discharge are the basic

chnical information upon which flood-plain regu-
tions are to be based. The flood profile is deter-
ined by hydraulic-engineering analyses, and it is
e basis for constructing the flood map. To deter-
ine the regional-flood profile, over 30 flood-plain
oss sections and supplemental data were ob-
ined by field surveys. (Knapp-USGS)

costs.
Identifiers: *Egypt, *Qattara Depression, *Sahara,
*Libyan Desert, *Mediterranean Sea, Area
development.

Scientists from West Germany have been studying the feasibility of constructing a pumped storage power plant on the Qattara Depression of northwestern Egypt. The depression reaches a depth of 135 m below sea level, while the mountain escarpment on its northern edge attains a height of 230 m above sea level. Water would have to be brought in from the Mediterranean Sea, a distance of 80 km, but a tunnel to deliver the water to an underground power station appears feasible. During off-peak hours power could be generated under low pressure using the 60 m drop from the sea-level tunnel to the underground power station. This power could then be used to pump water to a high-level reservoir for storage. If the depression were filled to a level of -60 m and a natural basin at the +215 m level were used for water storage, then a head of 275 m would be available for peak-load power generation. Among the advantages of developing the Qattara Depression are guaranteed energy, proximity to centers of power consumption with attendant savings in transmission costs, and the potential for future area development. Economic feasibility of the 4000MW project will be determined by the cost of tunnel construction. (Carr-Arizona)

**HYDRO POTENTIAL OF THE TEXAS WATER
PLAN,**
Texas Tech. Univ., Lubbock.
George A. Whetstone.
Water Power, Vol 22, No 2, p 52-53, February 1970. 1 fig, 16 ref.

Descriptors: *Texas, *Inter-basin transfers, *Pumped storage, *Hydroelectric power, *Mississippi River, Water transfer, Diversion, Water utilization, Irrigation, New Mexico, Arid lands, Semiarid climates, Electric power production, Dams, Reservoirs, Hydroelectric plants, Economic feasibility.
Identifiers: *Texas water plan.

The basic proposals contained in the Texas Water Plan are outlined and potential water power development under the project is discussed. The majority of the energy supply in Texas has never been derived from water power and conventional hydroelectric developments are unlikely to occur in the future. Pumped storage, however, may be feasible in areas of favorable topography and adequate water supply. A number of sites should be available in East Texas in connection with storage reservoirs envisioned as part of the Texas Water Plan. Other sites should exist at the pumping stations of the Trans-Texas canal. In light of this, it is quite likely that a number of pumped storage projects will be included in the plan. (Carr-Arizona)

DILUTE POLYMER SOLUTIONS,**
Queen's University of Belfast (Northern Ireland). Dept. of Civil Engineering.
R. H. J. Sellin, and B. J. S. Barnard.
Text also in French. Journal of Hydraulic Research, Vol 8, No 2, p 219-228, 1970. 10 p, 5 fig, 12 ref.

Descriptors: *Open channel flow, *Turbulent flow, *Fluid friction, Sewers, Shear drag, Water chemistry, Water properties, Water structure.
Identifiers: Hydrodynamic drag reduction, Polymers.

The effect of long chain polymer additives on turbulent flow lessens hydrodynamic drag. In seeking practical applications of this effect work has been concentrated on ship drag reduction and on flow in pipes. Recent work has explored a possible hydrodynamic connection with the known visco-elastic properties of the polymer solutions but experimental verification is not easy to obtain because of the low concentrations of polymer solutions (as little as 1 ppm) known to exhibit drag-reducing effects. Experiments were conducted with a polyethylene oxide which is an unbranced chain molecule. Maximum flow augmentation was achieved for sewers using a dose of about 8 ppm whereas for the pipe flow, augmentation was still increasing at 20 ppm. It is suggested that Polyox or some other drag-reducing agent could with advantage be added to the storm sewer system of a town when there is danger of the system becoming surcharged. (Knapp-USGS)

13th Congress International Association of Hydraulic Research Proceedings, Vol 1, p 113-122, Aug-Sept 1969. 10 p, 7 fig, 1 tab, 6 ref.

Descriptors: *Flow separation, *Hydraulic conduits, Hydraulic design, Hydraulic engineering, Hydraulic models, Model tests, *Transition flow, Vanes, Flow control, *Diffusers, Channel flow, Channels, Open channel flow, Hydraulics, Fluid mechanics.
Identifiers: Divergence, *Diverging sections, Velocity head, India, Splitters, Blockage effect (Hydraulic), Foreign testing.

Flow through diverging channels presents design problems because of separation phenomena in the diverging flow, resulting in low pressure recovery or velocity head recovery in the downstream section. Flow separation adversely affects the exit flow conditions and performance level of the diverging channel. Maximum effectiveness in simple diffusers is achieved with an angle of 7 deg between the diverging walls of the diffuser, but the resulting structure is very long and not economical. One method for eliminating flow separation is using vanes to change diffuser geometry so that regions of stalled flow will not form, blocking the flow. Hydraulic model tests on wide diverging channels with vanes were conducted to control flow separation and to determine the efficiency of the expansion with respect to velocity head recovery. Results indicate that increasing the uniformity coefficient of the flow downstream increases velocity head recovery and the efficiency of the expansion. An expression to evaluate pressure head recovery is derived from momentum considerations and shows good agreement with experimental values. (USBR)

FLOW INVESTIGATIONS IN A WATER FLOW CHANNEL AT SUBSONIC AND SUPERSONIC VELOCITIES,
A. Bolcs.
Escher Wyss News, Vol 42, No 1, p 18-29, 1969. 12 p, 20 fig, 1 tab, 9 ref.

Descriptors: *Open channel flow, Fluid flow, *Subsonic flow, Boundary layers, *Supersonic flow, Hydraulics, Thre-dimensional, Laminar flow, Two-dimensional, Open channels, Flow around objects, Hydraulic turbines, Hydraulic models, Mach number, Shock waves, Turbine blades, *Velocity, Fluid friction, Dyes.
Identifiers: *Flow patterns.

Photographic recordings of flow patterns in an open flow channel are discussed. The flow at the surface of the water is made visible by streamers of dye. The photographs of the flow around an obstacle show the boundary-layer flow caused at the channel bottom. The recordings show that the 2 flows are basically different. As a result of frictional action, a 3-dimensional flow is formed around the model in the vicinity of the channel walls; for small values of the ratio of water depth to model length, this flow pattern develops over the entire height of the layer of water. In addition to the photographs at subsonic velocities, flow patterns are shown for shallow-water flow that is analogous to supersonic flow. (USBR)

HIGH-VOLTAGE ELECTRICAL TESTING OF POWER EQUIPMENT,
GEC Power Engineering Ltd., Trafford Park (England).
A. S. Husbands.
Science and Technology, Vol 36, No 1, p 42-48, 1969. 7 p, 6 fig, 1 tab, 9 ref.

Descriptors: *Extra high voltage, *Test facilities, Laboratory tests, Laboratory equipment, *Electrical equipment, *Testing, Switchgear, Power transformers, Electrical insulators, Impulse tests (Electrical), Contamination, Standards.
Identifiers: *Foreign testing, Great Britain, High voltage, Flashover, Switching surges.

Test facilities at a British high-voltage laboratory are described. Particular reference is made to the test and development work required for testing new high-voltage equipment. The arrangement and purposes of all test devices are explained, and examples of high-voltage investigations are given. All standardized tests can be performed to demonstrate the qualities of insulation and soundness of design. In addition, special tests simulating adverse service conditions, including surge voltages and the effects of rainfall or contamination on the surfaces of insulators, can be made. The laboratory can test adequately all high-voltage components of systems rated up to 750 kv rms, and in certain cases for higher system voltages. (USBR)

LARGE KAPLAN TURBINES,
E. Muhlemann.
Escher Wyss News, Vol 42, No 1, p 3-10, 1969. 8 p, 11 fig, 7 ref.

Descriptors: *Kaplan turbines, Hydraulic turbines, Efficiencies, Hydraulic machinery, Turbine runners, Costs, Acceptance testing, Model tests, Performance tests, Foreign research, Cavitation, Stress, Design, Thrust bearings, Servomechanisms.
Identifiers: Switzerland, Turbine efficiency, Turbine head covers.

Two of the largest Kaplan turbine units in operation are described. The turbines were manufactured by Escher Syss, Switzerland, and are installed at Aschach plant of the Danube Electricity Co, Vienna, and the Jupia plant Sao Paulo Central Electricity Board, Brazil. Advantages of large hydraulic turbines of 8-m runner diameter are reduction in relative cost, such as cost per unit weight, and gain in hydraulic efficiency because of reduction in flow losses. Above 8-m runner diameter, these advantages drop rapidly. Performance testing of model turbines as an alternative to acceptance testing of full-scale units is discussed. Design factors for the large Kaplan units are considered. (USBR)

THE 'BIPLANE' BUTTERFLY VALVE, SYSTEM ESCHER WYSS,
Bruno Barp, and Herbert Grein.
Escher Wyss News, Vol 42, No 1, p 11-17, 1969. 7 p, 14 fig, 1 tab, 8 ref.

Descriptors: *Butterfly valves, *Head loss, Weight, Fluid flow, Flow separation, Velocity, Fluid mechanics, Mechanical engineering, Model tests, Foreign research, Efficiencies, Cavitation, Test procedures, Pressure, Losses, *Hydraulic valves, *Hydraulic gates and valves.
Identifiers: Switzerland, *Test results.

A butterfly valve designed for low pressure loss and optimum use of material is described. Design of a butterfly valve is based on hydraulic strength and lowest weight as well as minimum losses through the valve. Comparative weights and head losses of various full-scale butterfly valves are tabulated. Through extensive model testing, the new biplane disc-shaped butterfly valve with flow guides was developed. The tests demonstrate the superiority of the valve, particularly where large diameters are concerned. (USBR)

ON PROCEDURES FOR RELIABILITY EVALUATIONS OF TRANSMISSION SYSTEMS,
Power Technologies, Inc., Schenectady, N.Y.; and General Electric Co., Schenectady, N.Y.
Robert J. Ringlee, and Sheila D. Goode.
Institute of Electrical and Electronics Engineers, Transactions on Power Apparatus and Systems, Vol PAS-89, No 4, p 527-536, Apr 1970. 10 p, 8 fig, 4 tab, 19 ref, 2 append, disc.

Descriptors: Transmission (Electrical), *Reliability, Performance, Bus (Electrical), Evaluation, *Transmission lines, Forecasting, Power systems operations, Computers, Overloads, Bibliographies, Analysis, Probability, *Failure (Power), Substations (Electrical), Circuit breakers, Analytical techniques, Power tranformers, Calculations, Models.
Identifiers: *Outages.

Quantitative reliability evaluations of transmission systems are discussed. Substantial progress has been made in perfecting methods for simulating network power flows rapidly on digital computing machines, and the time for the general realization of quantitative transmission system reliability evaluations may be near. One limiting area appears to be practical, rapid evaluation of stability limits. Techniques for predicting the frequency with which certain transmission contingencies will occur have been known for some time. Combining rapid simulation methods with event prediction techniques may offer a practical method for accomplishing transmission system reliability evaluations. A generalization of the concepts of the component run-fail-repair life cycle and a description of a step-by-step procedure for performing reliability evaluations are included. Simple algebraic results for the prediction of frequency and duration of transmission contingencies are obtained using the renewal process theory. Techniques described are as feasible for hand as for machine computations. (USBR)

EVALUATION OF INSULATION AND DAMAGE OF HIGH-VOLTAGE STATOR WINDINGS,
Hitachi Ltd., Tokyo (Japan).
K. Matsunobu, and T. Inoue.
Electronic Engineering (Japan), Vol 89, No 8, p 1-8, Aug 1969. 8 p, 13 fig, 4 tab, 9 ref, append.

Descriptors: *Electric insulation, *Dielectrics, Testing, Performance, *Stators, *Electrical coronas, Electric generators, Cracks, Quantitative analysis, Electric motors, Voids, Laboratory tests, Experimental data, Foreign research.
Identifiers: Breakdown, Service life, *Electric discharges, *Electric machinery, Japan.

Breakdown of insulating materials used in high-voltage stator windings is caused by corona or treeing discharges originating from defects such as voids, cracks, or surface scratches. The dielectric strength of electric machinery is usually tested by one of several methods, but no previous study has been made on the relations between these various methods or on the relation between insulation life and breakdown voltage. Special attention is placed on local insulation damage produced inside high-voltage stator windings, and a relations between damage rate and insulation life is formulated. A quantitative analysis is presented on the effect that various test methods have on breakdown voltage, insulation life, and damage rate. Calculated results agree well with measurements. The cumulative rule seems to hold true for insulation life and is being used to predict failure rates of electronic devices. (USBR)

8E. Rock Mechanics and Geology

GEOPHYSICAL EXPLORATION AT SMALL EARTHFILL DAMSITES,
Department of Agriculture, Fresno, Calif.
E. E. Haskell, and Dorn Dunham.
Journal of Soil and Water Conservation, Vol 25, No 2, March-April 1970, p 66-67, 5 fig, 2 ref.

Descriptors: *Terrain analysis, Trenches, Spillways, Groundwater movement, *Rock foundations, Earth dams, *Rock properties.
Identifiers: *Seismic refraction method, Backhoe digging, Auger holes, Sierra Nevada foothills, California.

When constructing core trenches and spillways at small dams it is necessary to determine the types of rocks present at various levels and the solidity of these rocks. Although hand augering and backhoe digging are adequate methods for high depth calculations, the seismic refraction method is more reliable for deeper level excavation. (Holmes-Rutgers)
W70-08429

STATUS AND TRENDS IN LOGGING,
Marathon Oil Co., Littleton, Colo.
Hilton B. Evans.
Geophysics, Vol 35, No 1, p 93-112, Feb 1970. 20 p, 16 fig, 65 ref.

Descriptors: *Borehole geophysics, Boreholes, Drill holes, *Subsurface investigations, *Logging (Recording), Wells, Exploration, Geophysics, Reviews, Bibliographies, *Rock properties, Geologic formations, Data processing, Geologic investigations, Computers.
Identifiers: *Well logging, *Geophysical logging, Analog-to-digital converter, Geophysical prospecting.

Logging service companies are attempting to provide a good selection of borehole logging devices popular with the oil industry. The introduction of new services or new devices is being limited because oil companies are standardizing the logging suites run in the various geographic operating areas. Some new techniques appear to have important uses. Standard logging suites and evaluation techniques are discussed in terms of open-hole and cased-hole devices, and measurement of rock properties. Methods include nuclear, electrical, acoustic, gravity, and magnetic logging. The use of logging methods is increasing outside the petroleum industry in exploration and evaluation of mineral deposits, groundwater, and other geological investigations. Log digitizing and computer processing are routine in major oil companies, but methods and equipment vary greatly. Commercial digitizing services are currently too expensive for extensive use, but per-log costs are declining as more companies offer competitive services. Current research and development emphasis is on pulsed neutron-spectroscopy, acoustic measurements, and digital processing techniques. Has 65 references. (USBR)

09. MANPOWER, GRANTS AND FACILITIES

9D. Grants, Contracts, and Research Act Allotments

WATER RESEARCH SUMMARY.
Oregon State Univ., Corvallis. Water Resources Research Inst.

Oregon State University Water Resources Research Institute Report No 3, March 1970. 164 p.
Descriptors: *Water resources, *Water Resources Research Act, *Research facilities, *Projects, *Oregon, Resource development, Laboratories, Grants, Universities.
Identifiers: *Water resources research.

Research facilities and current projects at Oregon State University in water-related subjects are listed. Water related research sponsored by the Water Resources Research Institute at other universities in Oregon is included. The subject areas are water supply augmentation, water quality, and recreational use of water. (Knapp-USGS)

10. SCIENTIFIC AND TECHNICAL INFORMATION

ESTUARINE RADIOECOLOGY - A BIBLIOGRAPHY OF REPORT LITERATURE,
Department of the Interior, Washington, D.C. Office of Library Services.
John M. Lattimer.
US Department of Interior, Office of Library Services Bibliography Series No 16, March 1970. 52 p, 219 ref.

Descriptors: *Bibliographies, *Estuaries, *Estuarine environment, *Radioecology, Radioactivity effects, Radioactive wastes, Radioisotopes.
Identifiers: *Estuarine radioecology.

This bibliography on estuarine radioecology lists technical reports published from 1960 through June 1969, with a few published after that date. These reports are concerned with the biological accumulation and cycling of radionuclides, radioactive sedimentation, and the effects of radiation on the biota associated with estuaries. A special feature of this bibliography is the listing of research projects in progress as of June 1969. An index of authors and a separate index of subjects is also provided. (Knapp-USGS)
W70-08470

BIBLIOGRAPHY AND INDEX OF GEOLOGY.
Geological Society of America, Boulder, Colo.

Geological Society of America Bibliography and Index of Geology Series, 1970, published by Geological Society of America, Boulder, Colorado.

Descriptors: *Bibliographies, *Geology, Documentation, Publications, Information retrieval.
Identifiers: *Bibliography and Index of Geology.

The Bibliography and Index of Geology, published in twelve monthly issues and an annual compilation, covers the earth science literature of the world. The monthly issues are divided into 21 intradisciplinary categories. The citations within each category are listed by sequentially increasing accession numbers. They consist of the bibliographic information, a Universal Decimal Classificiation number, and a group of descriptors, descriptive phrases, or keywords. The bibliographic citations are followed by Subject and Author Indexes. The Subject Index contains three-level term sets following the system devised and used by the U.S. Geological Survey. The Author Index is alphabetically arranged. The preparation of this material has been accomplished with automatic data processing equipment. The entire contents of the Bibliography are stored on magnetic tape and are part of a permanent reference file (GEO.REF). Computer sorting and printing of individual sections, or subject sets, and a 'search and retrieval' capability are being considered for the system. (Knapp-USGS)

A GENERALIZED COMPUTER MODEL FOR STEADY-STATE PERFORMANCE OF THE ACTIVATED SLUDGE PROCESS,

W70-08165 05D

A BURET CYLINDER FOR GRAIN-SIZE ANALYSIS OF SILT AND CLAY (WITH ALGOL-PROGRAM),
W70-08169 02J

VARIABLE BOUNDARY, TWO DIMENSIONAL TIDAL MODEL,
W70-08252 02L

THREE STATISTICAL PROGRAMS TO PROCESS LIMNOLOGICAL DATA,
W70-08508 02H

COMPUTERS
DISPATCHING SYSTEM FOR CONTROL OF COMBINED SEWER LOSSES,
W70-08435 05G

CONDEMNATION
SMITH V ARKANSAS IRRIGATION CO (STATE DELEGATION OF POWER OF EMINENT DOMAIN).
W70-08574 06E

CONDENSATION
CONDENSATION AS A MECHANISM FOR WATER GAIN IN NOCTURNAL DESERT POIKILOTHERMS,
W70-08344 03B

EVAPORATION AND CONDENSATION ON BARE SOIL UNDER IRRIGATION IN THE EAST CENTRAL GREAT PLAINS,
W70-08352 02D

CONDITIONING
CHEMICAL CONDITIONING OF BIOLOGICAL SLUDGES FOR VACUUM FILTRATION,
W70-08304 05D

CONDUCTIVITY
FRESHWATER ECOLOGY IN THE MATO GROSSO, CENTRAL BRAZIL I. THE CONDUCTIVITY OF SOME NATURAL WATERS,
W70-08346 02E

RELATIONSHIPS BETWEEN CERTAIN INDICES OF SALINE WATER IRRIGATED SOILS OF WESTERN RAJASTHAN,
W70-08347 02G

CONFERENCES
WORKSHOP ON SNOW AND ICE HYDROLOGY.
W70-08276 02C

WATER STUDIES IN OREGON.
W70-08475 05G

CONJUGATED PENTACHLOROPHENATE
STUDIES ON THE METABOLISM OF PENTACHLOROPHENATE, A HERBICIDE, IN AQUATIC ORGANISMS -III. ISOLATION AND IDENTIFICATION OF A CONJUGATED PCP YIELDED BY A SHELL-FISH, TAPES PHILIPPINARUM (IN JAPANESE),
W70-08378 05A

CONNECTICUT
FLOOD PLAIN INFORMATION, QUINNIPIAC RIVER, SOUTHINGTON, CONNECTICUT.
W70-08482 04A

WATERBORNE STYRENE IN A CRYSTALLINE BEDROCK AQUIFER IN THE GALES FERRY AREA, LEDYARD, SOUTHEASTERN CONNECTICUT,
W70-08489 05B

WARGO V CONNECTICUT LIGHT AND POWER CO (RELEASE OF IMPOUNDED WATERS AS A RESULT OF NEGLIGENTLY CONSTRUCTED FLASHBOARDS).
W70-08550 04A

CONSOLIDATION
OVERCONSOLIDATION BY DESICCATION OF COASTAL LATE-QUATERNARY CLAYS IN ISRAEL,
W70-08174 02J

CONSTITUTIONAL LAW
NEW YORK WATER SERV CORP V WATER POWER AND CONTROL COMM'N OF DEPT OF CONSERVATION OF NEW YORK (EXCESSIVE DELEGATION OF POWER TO DETERMINE NECESSITY FOR WELLS AS NOT CREATING PROPERTY RIGHT).
W70-08581 03D

CONTACT STABILIZATION PROCESS
CONTACT STABILIZATION PROCESS CHOSEN FOR NEW DYRDEN PLANT.

SIMULATION ANALYSIS
[illegible] STABILITY STUDIES OF INDUSTRIAL WASTES EFFECTED THROUGH [illegible] SIMULATION,
W70-08355 05D

SLUDGE
ARE PAVED DRYING BEDS EFFECTIVE FOR DEWATERING DIGESTED SLUDGE.
W70-08300 05D

TYPES OF ACTIVATED SLUDGE WHICH SEPARATE POORLY,
W70-08301 05D

CHEMICAL CONDITIONING OF BIOLOGICAL SLUDGES FOR VACUUM FILTRATION,
W70-08304 05D

EVALUATION OF THE KRAUS MODEL OF ACTIVATED SLUDGE BULKING,
W70-08314 05D

ESTIMATION OF SLUDGE CENTRIFUGE PERFORMANCE,
W70-08320 05D

THE SURFACE OF ACTIVATED SLUDGE PARTICLES IN RELATION TO THEIR SETTLING CHARACTERISTICS,
W70-08391 05D

SLUDGE DISPOSAL
TREATMENT, USE, AND DISPOSAL OF WASTES FROM MODERN AGRICULTURE,
W70-08334 05D

CLEAN WATER AND ULTIMATE DISPOSAL,
W70-08337 05D

WET AIR OXIDATION AT LEVITTOWN,
W70-08400 05D

CANADA'S LARGEST SLUDGE INCINERATORS FIRED UP AND RUNNING.
W70-08402 05D

ULTIMATE SLUDGE DISPOSAL AND SOIL IMPROVEMENT,
W70-08405 05E

SLUDGE TREATMENT
STUDIES ON LIMESTONE TREATMENT OF ACID MINE DRAINAGE, OPTIMIZATION AND DEVELOPMENT OF IMPROVED CHEMICAL TECHNIQUES FOR THE TREATMENT OF COAL MINE DRAINAGE.
W70-08167 05D

ARE PAVED DRYING BEDS EFFECTIVE FOR DEWATERING DIGESTED SLUDGE.
W70-08300 05D

TREATMENT, USE, AND DISPOSAL OF WASTES FROM MODERN AGRICULTURE,
W70-08334 05D

CLEAN WATER AND ULTIMATE DISPOSAL,
W70-08337 05D

WET AIR OXIDATION AT LEVITTOWN,
W70-08400 05D

CANADA'S LARGEST SLUDGE INCINERATORS FIRED UP AND RUNNING.
W70-08402 05D

ULTIMATE SLUDGE DISPOSAL AND SOIL IMPROVEMENT,
W70-08405 05E

SLUDGE VOLUME INDEX
TYPES OF ACTIVATED SLUDGE WHICH SEPARATE POORLY,
W70-08301 05D

EVALUATION OF THE KRAUS MODEL OF ACTIVATED SLUDGE BULKING,
W70-08314 05D

SLUDGE YIELD
EFFECT OF OXYGEN TENSION ON O2 UPTAKE AND SLUDGE YIELD IN COMPLETELY MIXED HETEROGENEOUS POPULATIONS,
W70-08322 05D

SMALL WATERSHEDS
EVALUATION OF A METHOD FOR ESTIMATING SEDIMENT YIELD,
W70-08497 02J

SNOW COVER
SNOW ACCUMULATION RELATED TO ELEVATION, ASPECT AND FOREST CANOPY,
W70-08243 02C

SNOW STORAGE DISTRIBUTION IN RIVER BASINS,
W70-08268 02C

SNOW MANAGEMENT
INFLUENCE OF CONTOUR TRENCHING ON SNOW ACCUMULATION,
W70-08185 03B

SNOW HYDROLOGY IN THE FOREST ENVIRONMENT,
W70-08240 02C

WORKSHOP ON SNOW AND ICE HYDROLOGY.
W70-08276 02C

SNOW SURVEYS
PROBLEMS OF MEASURING AND EVALUATING SNOWCOVER,
W70-08242 02C

SNOWMELT
THE SYNTHESIS OF SNOWMELT HYDROGRAPHS,
W70-08244 02C

SNOWPACKS
SNOW HYDROLOGY OF THE PRAIRIE ENVIRONMENT,
W70-08241 02C

PROBLEMS OF MEASURING AND EVALUATING SNOWCOVER,
W70-08242 02C

SNOW ACCUMULATION RELATED TO ELEVATION, ASPECT AND FOREST CANOPY,

W70-08243 02C

SNOW STORAGE DISTRIBUTION IN RIVER BASINS,
W70-08268 02C

CIAL ADJUSTMENT
EVALUATION OF THE SOCIAL IMPACT OF RESERVOIR CONSTRUCTION ON THE RESIDENTIAL PLANS OF DISPLACED PERSONS IN KENTUCKY AND OHIO,
W70-08155 06B

CIAL ASPECTS
EVALUATION OF THE SOCIAL IMPACT OF RESERVOIR CONSTRUCTION ON THE RESIDENTIAL PLANS OF DISPLACED PERSONS IN KENTUCKY AND OHIO,
W70-08155 06B

SOCIO-ECONOMIC SIMULATION FOR WATER RESOURCE SYSTEM PLANNING,
W70-08453 06B

SOCIETY AND ITS PHYSICAL ENVIRONMENT.
W70-08544 06B

THE CHARISMATIC AND THE PLAYFUL IN OUTDOOR RECREATION,
W70-08546 06B

CIAL BEHAVIOR
ATTITUDES AND ATTITUDE CHANGE RELATING TO WATER RESOURCES,
W70-08421 06B

CIAL BENEFITS
ANTHROPOLOGICAL ANALYSIS OF SOCIAL AND CULTURAL BENEFITS AND COSTS FROM STREAM CONTROL MEASURES, PHASE I,
W70-08150 06B

ETHNOHISTORY AND CONTEMPORARY UNITED STATES SOCIAL PROBLEMS,
W70-08151 06E

CIAL CHANGE
ANTHROPOLOGICAL ANALYSIS OF SOCIAL AND CULTURAL BENEFITS AND COSTS FROM STREAM CONTROL MEASURES, PHASE I,
W70-08150 06B

ETHNOHISTORY AND CONTEMPORARY UNITED STATES SOCIAL PROBLEMS,
W70-08151 06E

CLIMATE, SURVIVAL AND THE SECOND-CLASS SOCIETIES IN PALESTINE BEFORE 3000 B. C.,
W70-08538 06G

CIAL IMPACT
ANTHROPOLOGICAL ANALYSIS OF SOCIAL AND CULTURAL BENEFITS AND COSTS FROM STREAM CONTROL MEASURES, PHASE I,
W70-08150 06B

ETHNOHISTORY AND CONTEMPORARY UNITED STATES SOCIAL PROBLEMS,
W70-08151 06E

A FEASIBILITY STUDY IN COMMUNICATIONS EFFECTIVENESS EVALUATING A PERSUASIVE FILM RELATING TO A WATER ISSUE,
W70-08422 06B

CIAL ORGANIZATION
ENVIRONMENTAL THREAT AND SOCIAL ORGANIZATION,
W70-08543 06B

CIAL VALUES
ENVIRONMENTAL THREAT AND SOCIAL ORGANIZATION,
W70-08543 06B

CIOLOGY
SOCIO-ECONOMIC SIMULATION FOR WATER RESOURCE SYSTEM PLANNING,
W70-08453 06B

DIUM
RELATIONSHIPS BETWEEN CERTAIN INDICES OF SALINE WATER IRRIGATED SOILS OF WESTERN RAJASTHAN,
W70-08347 02G

IL CHEMICAL PROPERTIES
SOIL MICROBIAL ECOLOGY OF VALLEY OF 10,000 SMOKES, ALASKA,
W70-08535 02G

IL CHEMISTRY
EVAPOTRANSPIRATION MEASUREMENT BY CHLORIDE TRANSLOCATION,
W70-08210 02D

IL COMPACTION
HYDRAULIC CONDUCTIVITY OF AN ISOTROPICALLY COMPRESSED SOIL,
W70-08223 02G

IL DENSITY
IMPORTANT PHYSICAL PROPERTIES OF PEAT MATERIALS,
W70-08424 02G

IL DESALINATION
COMPUTATION OF THE DESALINIZATION OF SALINE SOILS UNDERLAIN BY A WATER-PERMEABLE LAYER,
W70-08274 02G

IL DISPOSAL FIELDS
ULTIMATE SLUDGE DISPOSAL AND SOIL IMPROVEMENT,
W70-08405 05E

IL MANAGEMENT
WATER RELATIONS OF A PROFILE-MODIFIED SLOWLY PERMEABLE SOIL,
W70-08224 04B

IL MICROORGANISMS
SOIL MICROBIAL ECOLOGY OF VALLEY OF 10,000 SMOKES, ALASKA,
W70-08535 02G

SOIL MOISTURE
MOISTURE AND TEMPERATURE EFFECTS ON EMERGENCE AND INITIAL GROWTH OF TWO RANGE GRASSES,
W70-08342 02I

SOIL MOISTURE METERS
MEASUREMENT OF THE TOTAL SUCTION OF SOILS BY A THERMISTOR PSYCHROMETER,
W70-08220 02G

SOIL PHYSICAL PROPERTIES
IMPORTANT PHYSICAL PROPERTIES OF PEAT MATERIALS,
W70-08424 02G

DISTORTION TESTS ON DRAINED NATURAL CLAY SAMPLES,
W70-08481 02G

SOIL MICROBIAL ECOLOGY OF VALLEY OF 10,000 SMOKES, ALASKA,
W70-08535 02G

SOIL PHYSICS
HYDRAULIC CONDUCTIVITY OF AN ISOTROPICALLY COMPRESSED SOIL,
W70-08223 02G

SOIL SALINITY
PEANUT RESPONSE TO UNIFORM AND NON-UNIFORM SOIL SALINITY,
W70-08521 03C

SOIL SURVEYS
USING SOIL MAPS TO DELINEATE FLOODPLAINS IN A GLACIATED LOW-RELIEF LANDSCAPE,
W70-08183 02G

SOIL TEMPERATURE
MOISTURE AND TEMPERATURE EFFECTS ON EMERGENCE AND INITIAL GROWTH OF TWO RANGE GRASSES,
W70-08342 02I

SOIL WATER
EFFECT OF ANTECEDENT SOIL WATER ON PRESEASON RAINFALL STORAGE IN A SLOWLY PERMEABLE IRRIGATED SOIL,
W70-08184 02G

IMPORTANT PHYSICAL PROPERTIES OF PEAT MATERIALS,
W70-08424 02G

SOIL MICROBIAL ECOLOGY OF VALLEY OF 10,000 SMOKES, ALASKA,
W70-08535 02G

SOIL WATER MOVEMENT
EVAPOTRANSPIRATION MEASUREMENT BY CHLORIDE TRANSLOCATION,
W70-08210 02D

EVALUATION OF THE INTRINSIC-PENETRABILITY AND -DIFFUSIVITY CONCEPTS TO PREDICT HORIZONTAL INFILTRATION IN POROUS MEDIA,
W70-08219 02G

ANALYSIS OF RADIAL, STEADY-STATE SOLUTION, AND SOLUTE FLOW,
W70-08221 02G

PREDICTING MOISTURE DISTRIBUTIONS IN REWETTED SOILS,
W70-08222 02G

WATER RELATIONS OF A PROFILE-MODIFIED SLOWLY PERMEABLE SOIL,
W70-08224 04B

THE HYDROGEOLOGIC PARAMETER MU AND A METHOD FOR COMPUTING GROUNDWATER STORAGE,
W70-08266 07B

SOIL-WATER-PLANT RELATIONSHIPS
WATER BALANCE OF SOME WARM DESERT PLANTS IN A WET YEAR,
W70-08175 02D

MYCORRHIZA IN DESERT SOILS,
W70-08355 02I

SOLAR RADIATION
CONDITONS UNDER WHICH SOLAR RADIATION PENETRATES INTO ICE,
W70-08255 02C

SOLID WASTES
SOLIDS DON'T GO TO WASTE AT WYETH,
W70-08401 05D

SOLUBILITY
GENERAL PROBLEMS IN THE THEORY OF IONIC HYDRATION IN AQUEOUS SOLUTIONS,
W70-08518 01B

SOUTH AFRICA
DESIGN FLOOD DETERMINATION IN SOUTH AFRICA,
W70-08464 02E

SYNTHETIC UNITGRAPHS FOR SOUTH AFRICA,
W70-08500 02E

SOUTH PLATTE RIVER(COLO)
PROBABLE MAXIMUM PRECIPITATION OVER SOUTH PLATTE RIVER, COLORADO, AND MINNESOTA RIVER, MINNESOTA,
W70-08277 02B

SOUTHERN VICTORIA
SOIL WATER USE FROM AN APPLE ORCHARD UNDER VARIOUS SOIL MANAGEMENT SYSTEMS,
W70-08428 03F

SOUTHINGTON(CONN)

FLOOD PLAIN INFORMATION, QUINNIPIAC RIVER, SOUTHINGTON, CONNECTICUT.
W70-08482 04A

SPADEFOOT TOADS
SEASONAL CHANGES IN BODY FLUIDS IN A FIELD POPULATION OF SPADEFOOT TOADS,
W70-08348 02I

SPECTROSCOPY
SPECTROCHEMICAL DETERMINATION OF MICROGRAM QUANTITIES OF GERMANIUM IN NATURAL WATER CONTAINING HIGH CONCENTRATIONS OF HEAVY METALS,
W70-08496 05A

SPHAEROTILUS
THE BIOLOGY OF SPHAEROTILUS SPECIES,
W70-08397 05D

SPRINGS
PALYNOLOGICAL TRACING OF SALINE WATER SOURCES IN LAKE KINNERET REGION (ISRAEL),
W70-08209 02H

HITE V TOWN OF LURAY (CONSTRUCTION OF DEEDS AND ASCERTAINMENT OF WATER RIGHTS).
W70-08525 06E

STABLE ISOTOPES
HYDROGEN ISOTOPIC FRACTIONATION OF WATER PASSING THROUGH TREES,
W70-08186 02K

CARBON ISOTOPE FRACTIONATION DURING THE PRECIPITATION OF CALCIUM CARBONATE,
W70-08232 02K

STAGE-DISCHARGE RELATIONS
DETERMINATION OF CHANNEL CAPACITY OF THE TUOLUMNE RIVER DOWNSTREAM FROM LA GRANGE, STANISLAUS COUNTY, CALIFORNIA,
W70-08237 02E

STANFORD WATERSHED MODEL
NUMERICAL SIMULATION OF WATERSHEDS USING PHYSICAL SOIL PARAMETERS,
W70-08450 02E

STARCH INDUSTRY
APPLICATION OF REVERSE OSMOSIS TO WASTE STREAMS IN CORN PROCESSING INDUSTRY, PART 1,
W70-08418 05D

REVERSE OSMOSIS TREATMENT FOR CORN PROCESSING EFFLUENT--PART 2,
W70-08419 05D

STATISTICAL METHODS
A METHOD TO STUDY THE DISTRIBUTION OF HEAVY-MINERAL GRAIN ABUNDANCE IN A TURBIDITE,
W70-08202 02J

STATISTICAL ANALYSIS OF GROUNDWATER USE AND REPLENISHMENT,
W70-08231 04B

DISTRIBUTION OF ESTIMATES OF QUANTILES COMPARED BY DIFFERENT METHODS (AS APPLIED TO STREAMFLOW COMPUTATIONS),
W70-08270 02E

THREE STATISTICAL PROGRAMS TO PROCESS LIMNOLOGICAL DATA,
W70-08508 02H

STATISTICAL MODELS
RIVER FLOW FORECASTING THROUGH CONCEPTUAL MODELS - PART I - A DISCUSSION OF PRINCIPLES,
W70-08211 02E

STATISTICS
VARIABILITY OF WASTE TREATMENT PERFORMANCE,
W70-08321 05D

STATORS
EVALUATION OF INSULATION AND DAMAGE OF HIGH-VOLTAGE STATOR WINDINGS,
W70-08460 08C

STEEL MILL WASTES
ADVANCES MAKE WASTE WATER FILTRATION ECONOMICAL AND EFFECTIVE SOLUTION,
W70-08312 05D

STOMATA
AFTER-EFFECT OF WATER STRESS ON STOMATAL OPENING POTENTIAL I. TECHNIQUES AND MAGNITUDES,
W70-08530 02I

AFTER-EFFECT OF WATER STRESS ON STOMATAL OPENING II. POSSIBLE CAUSES,
W70-08531 02I

STOMATAL OPENING POTENTIAL
AFTER-EFFECT OF WATER STRESS ON STOMATAL OPENING POTENTIAL I. TECHNIQUES AND MAGNITUDES,
W70-08530 02I

AFTER-EFFECT OF WATER STRESS ON STOMATAL OPENING II. POSSIBLE CAUSES,
W70-08531 02I

STORAGE COEFFICIENT
TRANSMISSIVITY AND STORAGE COEFFICIENT OF AQUIFERS IN THE FOX HILLS SANDSTONE AND THE HELL CREEK FORMATION, MERCER AND OLIVER COUNTIES, NORTH DAKOTA,
W70-08485 02F

STRATIFICATION
STRATIFIED RESERVOIR CURRENTS, PARTS 1 AND 2,
W70-08501 02H

STRATIFIED FLOW
STRATIFIED RESERVOIR CURRENTS, PARTS 1 AND 2,
W70-08501 02H

STRATIGRAPHY
THE IDENTIFICATION OF ANCIENT BEACH SANDS BY THE COMBINATION OF SIZE ANALYSIS AND ELECTRON MICROSCOPY,
W70-08171 02J

A QUANTITATIVE MODEL OF CLIMBING RIPPLES AND THEIR CROSS-LAMINATED DEPOSITS,
W70-08194 02J

STREAM ORDER
QUANTITATIVE MORPHOLOGY OF THE DRAINAGE BASIN IN SEMI-ARID ENVIRONMENT,
W70-08526 02E

STREAMFLOW
DAVIDSON V VAUGHN (CONVEYANCE OF A RIGHT TO WITHDRAW WATER FROM A NATURAL WATERCOURSE).
W70-08190 06E

PRECIPITATION, STREAMFLOW, AND MAJOR FLOODS AT SELECTED SITES IN THE GILA RIVER DRAINAGE BASIN ABOVE COOLIDGE DAM, ARIZONA,
W70-08468 02E

THE MAGNITUDE AND EXTENT OF SALT-WATER CONTAMINATION IN THE CALOOSAHATCHEE RIVER BETWEEN LA BELLE AND OLGA, FLORIDA,
W70-08517 05B

STREAMFLOW FORECASTING
RIVER FLOW FORECASTING THROUGH CONCEPTUAL MODELS - PART I - A DISCUSSION OF PRINCIPLES,
W70-08211 02E

FUNDAMENTAL PRINCIPLES OF THE METHOD FOR COMPUTING MAXIMUM RUNOFF,
W70-08271 02E

STREAMFLOW RECORDS
NUMERICAL SIMULATION OF WATERSHEDS USING PHYSICAL SOIL PARAMETERS,
W70-08450 02E

STREAMFLOW REGULATION
OPTIMIZATION OF THE STREAM FLOW REGULATION BY THE HYDROELECTRIC STATIONS RESERVOIRS WITH THE HELP OF MATHEMATICAL MODELS,
W70-08454 04A

STREAMS
QUANTITATIVE MORPHOLOGY OF THE DRAINAGE BASIN IN SEMI-ARID ENVIRONMENT,
W70-08526 02E

STRESS
HYDRAULIC CONDUCTIVITY OF AN ISOTROPICALLY COMPRESSED SOIL,
W70-08223 02G

STYRENE
WATERBORNE STYRENE IN A CRYSTALLINE BEDROCK AQUIFER IN THE GALES FERRY AREA, LEDYARD, SOUTHEASTERN CONNECTICUT,
W70-08489 05B

SUBSONIC FLOW
FLOW INVESTIGATIONS IN A WATER FLOW CHANNEL AT SUBSONIC AND SUPERSONIC VELOCITIES,
W70-08458 08B

SUBSURFACE INVESTIGATIONS
STATUS AND TRENDS IN LOGGING,
W70-08446 08E

SUBSURFACE WATERS
WATER RESOURCES OF THE ARID LANDS,
W70-08351 04B

SUCCESSION
THE SUCCESSION OF THE BOTTOM FAUNA COMMUNITIES IN POLLUTED ESTUARINE HABITATS, (PRELIMINARY REPORT),
W70-08368 05C

SUDAN
FOOD AND WATER REQUIREMENTS OF DORCAS GAZELLE IN THE SUDAN,
W70-08529 02I

SUGARS
REMOVAL OF SUGARS BY ACTIVATED SLUDGE,
W70-08395 05D

SULFATES
SULFIDE TO SULFATE REACTION MECHANISM--A STUDY OF THE SULFIDE TO SULFATE REACTION MECHANISM AS IT RELATES TO THE FORMATION OF ACID MINE WATERS.
W70-08161 05G

SULFATE-REDUCING BACTERIA
PHYSIOLOGICAL AND BIOCHEMICAL CHARACTERISTICS OF SOME STRAINS OF SULPHATE-REDUCING BACTERIA,
W70-08336 05D

SULFIDE PULP LIQUORS

HE EFFECTS OF SULFIDE PULP WASTES ON THE GROWTH OF MARINE
HYTOPLANKTON,
70-08371 05C

FIDES
ULFIDE TO SULFATE REACTION MECHANISM--A STUDY OF THE
ULFIDE TO SULFATE REACTION MECHANISM AS IT RELATES TO THE
RMATION OF ACID MINE WATERS.
70-08161 05G

FITE LIQUORS
LASSIFICATION OF ORGANIC POLLUTION IN SURFACE WATERS,
70-08236 05A

FONATES
RGANIC COMPOUNDS REMOVED BY REVERSE OSMOSIS,
70-08408 05D

FUR BACTERIA
UMERATION, ISOLATION AND IDENTIFICATION OF SULPHATE-
EDUCING BACTERIA AN ANAEROBIC DIGESTION,
70-08332 05D

HYSIOLOGICAL AND BIOCHEMICAL CHARACTERISTICS OF SOME
TRAINS OF SULPHATE-REDUCING BACTERIA,
70-08336 05D

FISHES
SE OF ANTIMYCIN FOR SELECTIVE THINNING OF SUNFISH
OPULATIONS IN PONDS,
70-08367 05C

ERSONIC FLOW
LOW INVESTIGATIONS IN A WATER FLOW CHANNEL AT SUBSONIC AND
PERSONIC VELOCITIES,
70-08458 08B

ERVISORY CONTROL(POWER)
EW YORK WATER SERV CORP V WATER POWER AND CONTROL COMM'N OF
EP'T OF CONSERVATION OF NEW YORK (EXCESSIVE DELEGATION OF
OWER TO DETERMINE NECESSITY FOR WELLS AS NOT CREATING
ROPERTY RIGHT).
